Remarks a) For condition b) to be multiplicative, we do not need condition a) in all its strength, it suffices that u in $\mathcal{G}^+/\mathcal{G}^{\natural\sharp}$ normalize the image of L_σ, i.e. that we have

$$u(\sigma) \equiv \pm\sigma \quad (\mathcal{G}^{\natural\sharp}).$$

b) If $\mathcal{G}$ is "big enough", the projection homomorphism is injective
(12)

$$Z_{\rho,\sigma} \hookrightarrow \mathrm{Aut}(\mathcal{G}^+)$$

(cf. page 578)

Preceding material.

Remarks [d1]

[d2] If $\mathcal{G}$ is "big enough", the projection homomorphism is injective (12)

$$Z_{\rho,\sigma} \hookrightarrow \mathrm{Aut}(\mathcal{G}^{+})$$

(cf. page 578)

Preceding material.

Remarks †

If $\mathcal{G}$ is "big enough", the projection homomorphism is injective

(12)

$$Z_{\rho,\sigma} \hookrightarrow \mathrm{Aut}(\mathcal{G}^{+})$$

(cf. page 578)
