[scan 113]

[p. 346]

(VIII) — Calculations in $\mathrm{Sl}(2, \widehat{\mathbb{Z}})$: cocycles under σ_∞.

Let us take again a $g \in \begin{pmatrix} a & b \\ c & d \end{pmatrix} \in \mathrm{Sl}(2, \widehat{\mathbb{Z}})$, and compute $\sigma_\infty g \sigma_\infty^{-1}$, we find, thanks to

$$\sigma_\infty = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix} \qquad (48)$$

d1 the formulas

$$(90) \quad \begin{cases} \sigma_\infty g \sigma_\infty^{-1} = \begin{pmatrix} d & -c \\ -b & a \end{pmatrix} = {}^t(g^{-1}) & \text{the contragredient of } g \text{ !} \\ \text{i.e.} \\ \sigma_\infty g^{-1} \sigma_\infty^{-1} = {}^t g & \text{thus} \\ [\sigma_\infty, g^{-1}] = ({}^t g)(g) = \begin{pmatrix} a^2+b^2 & ac+bd \\ ac+bd & c^2+d^2 | c^2-d^2 \end{pmatrix} \end{cases}$$

$= \sigma_\infty g^{-1} \sigma_\infty | \sigma_\infty^{-1} g$ i1
m789

Marginal note. m789 N.B. we have $\sigma_\infty^{-1} = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} = -\sigma_\infty$ and d2 $\sigma_\infty^2 \neq 1$ in $\mathrm{Sl}(2, \widehat{\mathbb{Z}})$!

m790

Marginal note. m790 N.B. If $g \in \mathrm{Gl}(2, A)$, A any ring (for example $A = \mathbb{Z}_\ell$), we have $\sigma_\infty g \sigma_\infty^{-1} = \begin{pmatrix} d & -c \\ -b & a \end{pmatrix} = (\det g)^t(g^{-1})$

thus, taking the inverse of both sides in the last formula

$$(91) \quad \underbrace{g^{-1}\sigma_\infty(g)}_{({}^t g \cdot g)^{-1}} = \begin{pmatrix} c^2+d^2 & -(ac+bd) \\ -(ac+bd) & a^2+b^2 \end{pmatrix}.$$

On the other hand, let [d3] $h_0 \in \mathrm{Sl}(2,\widehat{\mathbb{Z}})$ we have

$$h_0\sigma_\infty(h_0) = h_0({}^t h_0^{-1})$$

thus

$$(*) \qquad h_0\sigma_\infty(h_0) = 1 \iff h_0 = {}^t h_0.$$

Finally, let

$$(91) \qquad \xi = \begin{pmatrix} A & B \\ C & D \end{pmatrix}$$

and consider the equation (68)

$$(**) \qquad \sigma_\infty(\xi) = l_1^\gamma \xi^{-1} l_0^\gamma$$

which is also equivalent to (*), with h_0 given by (65|66) [d4], l_0, l_1 by (44).

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 114]

$$(92) \qquad \begin{aligned} h_0 = l_0^{-\gamma}\xi &= \begin{pmatrix} 1 & +2\gamma \\ 0 & 1 \end{pmatrix}\begin{pmatrix} A & B \\ C & D \end{pmatrix} \\ &= \begin{pmatrix} A+2\gamma C & B+2\gamma D \\ C & D \end{pmatrix} \end{aligned}$$

thus "the equation in ξ" (**) (written in the quotient $\mathrm{Sl}(2,\widehat{\mathbb{Z}})'$ of $\widehat{\mathfrak{S}}^+_{0,3}$, is written $B + 2\gamma D = C$ i.e.

$$(93) \qquad \underbrace{C - B}_{1-D} = 2\gamma D \qquad \text{i.e.} \qquad \boxed{pD = 1} \text{ in case|one case}$$

[d1]

on recalling that $2\gamma + 1 = p$

(We should keep in mind that the equation (**) in $\mathrm{Sl}(2,\widehat{\mathbb{Z}})'$ means $h_0\sigma_\infty(h_0) = \pm 1$ i.e. $h_0 = \pm {}^t h_0$, [d2] but the sign $-$ would imply that we have $D = -D$ i.e. $2D = 0$ so $D = 0$, which is impossible if we assume that $\xi = \begin{pmatrix} A & B \\ C & D \end{pmatrix}$ comes from $\widehat{\Pi}_{0,3}$ so is in $\Pi'(2)$ i.e. $\equiv 1$ (2) (so that $D \equiv 1$ (2)). Thus we must indeed have (93).

Let us now take the parametric representation (70)[i3] of ξ (taking account of the equation $\xi\rho(\xi)\rho^2(\xi) = 1$ [d4] (64))

$$(94)\qquad \begin{array}{ll} \xi = \lambda\rho(\lambda)^{-1} & (\lambda \in \mathrm{Sl}(2,\widehat{\mathbb{Z}})) \\ \text{or}\quad \xi = \lambda'(-l_1^{-1})\rho(\lambda')^{-1} = \lambda\rho(\lambda)^{-1} & \begin{pmatrix} \lambda = \lambda'\tau_\infty \\ \lambda' \in \mathrm{Sl}(2,\widehat{\mathbb{Z}}) \end{pmatrix} \end{array}$$

[d5] with $\lambda \in \mathrm{Gl}(2,\widehat{\mathbb{Z}})$[*|∘] [d6] $\det\lambda = \pm 1$[i6], (in fact $\lambda \equiv 1$ (2) in the case that interests us, but no matter…)

[scan 115]

[p. 347]

then formula (78) gives A, B, C, D as quadratic functions in a, b, c, d, [d1] (paying Attention to the sign $\delta = -1$ in case 2°)[i1] [d2] thus (93) is written [d3]

$$(96) \qquad \boxed{(2\gamma+1)D = 1 \qquad \text{i.e.} \quad pD = 1} \qquad D = \delta(c^2 + d^2 + cd),$$

i.e. the multiplier p is obtained as a function of $\xi \in \widehat{\Pi}_{0,3}$ by taking the image of ξ in $\mathrm{Sl}(2, \widehat{\mathbb{Z}})'$, in the form $\begin{pmatrix} A & B \\ C & D \end{pmatrix}$ (there is a sign ambiguity, removed by the choice of λ such that $\xi = \lambda\rho(\lambda)^{-1}$, the image of λ in $\mathrm{Gl}(2, \widehat{\mathbb{Z}})'$ not|in determining a matrix (still denoted λ) of $\mathrm{Gl}(2, \widehat{\mathbb{Z}})$ except up to a sign, but $\lambda\rho(\lambda)^{-1}$ no longer depends on the choice of this sign…), by the formula

$$(97) \qquad p = \frac{1}{D} \qquad (D = \delta(c^2 + d^2 + cd))$$

Let us now note that on reduction modulo 3, the quadratic form $c^2 + d^2 + cd = (c+d)^2 - cd$ takes only the values 0 and 1 (clear if $c = 0$, if $d = 0$, [d4] — so we find a perfect square in these [d5] cases, otherwise $c, d = \pm 1$, and $f(c, d) = 1 + 1 \pm 1 \equiv 1$ or 0 [d6] (3). Now here we must find a unit so the value 0 excluded, so

[scan 116]

m792

Marginal note. m792 N.B. We have $D \equiv p \equiv \delta$ (3) (98) knowledge of D (or p, or δ) modulo 3 d1 tells us — which case we have in the parametric representation of ξ. Useless now to treat these cases separately — since we have $\xi = \lambda\rho(\lambda)^{-1}$, $\lambda = \lambda'\tau_\infty$, $\det\lambda = -1$.

$$p \equiv \delta \quad (3)$$

(where $\delta = \det\lambda \in \{\pm 1\}$, $\xi = \lambda\rho(\lambda)^{-1}$)i1 d2 i.e.

$$\begin{cases} \text{Case } \xi = \lambda\rho(\lambda)^{-1} \quad (\lambda \in \mathrm{Sl}(2,\widehat{\mathbb{Z}})) \Longleftrightarrow p \equiv 1\ (3) \quad \Longleftrightarrow \gamma \equiv 0\ (3) \\ \text{Case } \xi = \lambda' l_1^{-1}\rho(\lambda)^{-1}|\rho(\lambda')^{-1} \quad (\lambda' \in \mathrm{Sl}(2,\widehat{\mathbb{Z}})) \Longleftrightarrow p \equiv -1\ (3) \Longleftrightarrow \gamma \equiv -1\ (3). \end{cases}$$

B) Case $\xi = \lambda' l_0^{-1}\rho(\lambda')^{-1} = (\lambda' l_0^{-1})(\rho\lambda'^{-1}\rho^{-1})$.
Using the second formula (77) we find

$$\xi = \begin{pmatrix} a & b \\ c & d \end{pmatrix}\begin{pmatrix} 1 & 2 \\ 0 & 1 \end{pmatrix}\begin{pmatrix} a-c & c \\ a+b-c-d & c+d \end{pmatrix} = \begin{pmatrix} A & B \\ C & D \end{pmatrix}$$

with

$$(99) \quad \begin{cases} A = 3a^2 + b^2 + 3ab - 3ac - 2ad - bc - bd & B = 3ac + 2ad + bc + bd \\ C = -(3c^2 + 3cd + d^2) + 3ac + ad + 2bc + bd & D = 3c^2 + 3cd + d^2 \end{cases},$$

and formula (93) (which expresses "the equation in ξ" (**), or the one in h_0 (*)) is written, d6 taking account of

N.B. $C + D - B = -1|-\delta$.

$$B - C = -1 + D,$$

in the form d7

$$2\gamma D = -1 - D \qquad \text{i.e.}$$

$$(100) \quad \boxed{(2\gamma+1)D = -1 \qquad \text{i.e.} \quad pD = -1},$$

m794

Marginal note. m794 as before we cannot have $h_0 = -{}^t h_0$, for we cannot have $D = 0$ if we assume that $\xi \equiv 1$ (2), hence $D \equiv 1$ (2).

so here the multiplier p is expressed as a function of the image of ξ in $\mathrm{Sl}(2,\widehat{\mathbb{Z}})'$, put in the form $\begin{pmatrix} A & B \\ C & D \end{pmatrix}$ where $A, B, C, D \in \widehat{\mathbb{Z}}$ — and on removing the sign ambiguity as before — by the formula

$$(101) \quad p = -\frac{1}{D} \qquad (D = 3c^2 + 3cd + d^2 | 3(c^2 + 3cd + d^2)).$$

[scan 117]

[p. 348]

Here it is clear that the only values modulo 3 represented by the quadratic form $3c^2 + 3cd + d^2 \equiv d^2$ (3) are 0 and 1, whence

$$(102) \quad p \equiv -1 \ (3) \quad (\text{i.e. } \gamma \equiv -1 \ (3)) \quad \text{if } \xi = \lambda l_0^{-1} \rho(\lambda)^{-1}$$

$$(\Longleftrightarrow g = \lambda_0 l_0^{-1} \rho(\lambda_0)^{-1})$$

This study thus does show that we are in the case $\xi = \lambda\rho(\lambda)^{-1}$, resp. $\xi = \lambda l_0^{-1}\rho(\lambda)^{-1}$, according as $p = \chi(u) \equiv 1$ or $\equiv -1$ (3), i.e. according as $\gamma \equiv 0$ or $\gamma \equiv -1$ (3).

Remarks. 1°) Placing ourselves in $\mathrm{Sl}(2, \widehat{\mathbb{Z}})'$ [d1] (or rather, in its[i1] [d2] subgroup $\Pi(2)' = \mathrm{Ker}(\mathrm{Sl}(2, \widehat{\mathbb{Z}})' \to \mathrm{Sl}(2, \mathbb{Z}/2\mathbb{Z}))$ in place of $\widehat{\Pi}_{0,3}$, to [d3] determine the[i2] solutions of "the equation in ξ" (**) (cf. (68)), when ξ is put in parametric form (94), we see that as a condition on $\lambda = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$, this equation is relatively innocuous and very simple — it simply says that $pD = 1$, where $D = c^2 + d^2 + cd$ in the first case, $D = -(c^2 + d^2 + cd)$ in the second. If we do not fix $p \in \widehat{\mathbb{Z}}^*$ beforehand, this condition is simply that the element

[scan 118]

D of $\widehat{\mathbb{Z}}$ be a unit, i.e.

$$(103) \quad D \in \widehat{\mathbb{Z}}^*$$

— and we then determine p uniquely in terms of D , hence of c and d and the sign δ by $D = \delta(c^2 + d^2 + cd)$, [d1i1] ($a$ and b are of no use) — hence also in terms of $\lambda \in \widehat{\Pi}_{0,3} \cdot (1, \tau) | \{1, \tau\}$ [i2], itself uniquely determined by ξ.

N.B. We will have p

Thus knowledge of $\xi \in \widehat{\Pi}_{0,3}$ suffices to determine the multiplier [i3] $p = 2\gamma + 1 \in \widehat{\mathbb{Z}}^*$ [i4], hence also $\gamma \in \widehat{\mathbb{Z}}$, and $h_0 = l_0^{-\gamma}\xi$, hence also g_0 (by formula (66), $g_0^{-1}\sigma_\infty(g_0) = h_0$), and consequently g by formula (62), $g = \sigma_\infty(g_0) l_1^\gamma \rho(g_0)^{-1}$, hence u by (50). It is interesting to make sure that D|it [d2] does not change when we make the change (69)

$$\xi \longmapsto \xi' = l_0^{-\alpha} \xi l_1^\alpha,$$

in matrix terms, we have indeed

$$(104) \quad l_0^{-\alpha} \xi l_1^\alpha = \begin{pmatrix} 1 & 2\alpha \\ 0 & 1 \end{pmatrix} \begin{pmatrix} A & B \\ C & D \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 2\alpha & 1 \end{pmatrix} = \begin{pmatrix} A + 2\alpha(B + C) + 4\alpha^2 D & B + 2\alpha D \\ C + 2\alpha D & D \end{pmatrix}.$$

2/ But we should take care that in full rigor mere knowledge of the image of ξ in $\mathrm{Sl}(2, \widehat{\mathbb{Z}})'$ allows us to determine the multiplier p only up to sign — on the other hand knowledge of the image of λ in $\mathrm{Gl}(2, \widehat{\mathbb{Z}})'$ — hence of a matrix $\begin{pmatrix} a & b \\ c & d \end{pmatrix} \in \mathrm{Sl}|\mathrm{Gl}(2, \widehat{\mathbb{Z}})$ defined up to sign — allows us to determine

[p. 349]

p as the inverse of D, given [d1] by $D = \delta(c^2 + cd + d^2)$ [d2]. where $\delta \in \{\pm 1\}$ is determined by the condition $D \equiv \delta$ (3).[i1]

3/ We know by arithmetic means (since $\Pi_{\mathbb{Q}} \xrightarrow{\chi} \widehat{\mathbb{Z}}^*$ is surjective) that we must find any $p \in \widehat{\mathbb{Z}}^*$ in the form $1/D$ (or again, in the form D), where $D = c^2 + cd + d^2$ if $p \equiv 1$ (3), and

$D = -3(c^2+cd)-|+d^2$ if $p \equiv -1$ (3), with $c, d \in \widehat{\mathbb{Z}}$, and even $c \equiv 0$ (2), $d \equiv 1$ (2). If we want the direct verification,[i2] (We are reduced to verifying it separately for the various $\mathbb{Z}_\ell$, i.e. to proving the

Corollary. 1°)|°) If ℓ [d3] prime $\neq 3$, then $\forall \beta|p \in \mathbb{Z}_\ell^*$ can be put equally well in the forms c^2+cd+d^2, or $-(3(c^2+cd)+d^2)$ (with $c, d \in \widehat{\mathbb{Z}}_\ell|\mathbb{Z}_\ell$). If $\ell = 2$, we can even suppose $c \equiv 0$, $d \equiv 1$ (2). For $p \in \mathbb{Z}_\ell^*$, $\ell = 3$, it can be put in the form c^2+cd+d^2 (resp. $-3(c^2+cd)-|+d^2$) iff $p \equiv 1$ (3) (resp. $p \equiv -1$ (3)), cases which are mutually exclusive. [m796]

Marginal note. [m796] we don't care about the|about $-(3(c^2+cd)+d^2)$!

4/ Returning to the "innocuous" reduction in $\mathrm{Sl}(2, \widehat{\mathbb{Z}})'$ of "the equation in λ" as meaning simply that $c^2+d^2+cd \in \widehat{\mathbb{Z}}^*$ [d4], we might hope

to have a method for constructing even in $\widehat{\Pi}_{0,3}$ big batches of solutions of the equation in question. But I have absolutely not managed it — not even to construct a single one explicitly, apart from those which correspond to the case $u = 1$, and $u = \tau_\infty$.

A question: Let $\lambda_0 \in \mathrm{Sl}(2, \widehat{\mathbb{Z}})'^{|*}$, $\lambda_0 \equiv 1$ (2), be such that $\xi_0 = \lambda_0 \rho(\lambda_0)^{-1}$ (say, or $\xi = \lambda(-l_0^{-1})\rho(\lambda_0)^{-1}$) [d1] satisfies in $\mathrm{Sl}(2, \widehat{\mathbb{Z}})'$ an "equation in ξ" for a suitable $\gamma = \frac{p-1}{2}$ ($p \in \widehat{\mathbb{Z}}^*$) — i.e. $c^2+d^2+cd \in \widehat{\mathbb{Z}}^*$ (resp. $3(c^2+cd)+d^2 \in \widehat{\mathbb{Z}}^*$). Does there then exist a $\lambda|\xi \in \widehat{\Pi}_{0,3}$ above λ_0, such that $\xi = \lambda\rho(\lambda)^{-1}$ (resp....) satisfies an equation in ξ as well (necessarily with the same γ) ?

[p. 350]

43 [d1] – Digression on the 1-[i1]cocycles of cyclic groups.

Let|Let Π be a group, ρ an automorphism of Π such that

$$\rho^n = \mathrm{id} \tag{1}$$

where $n \in \mathbb{N}^*$. We thus have an operation of the cyclic group $\mathbb{Z}/n\mathbb{Z}$ on Π, whence a semidirect product

$$\widetilde{\Pi} = \Pi.\,\mathbb{Z}/n\mathbb{Z}, \tag{1|2}$$

and an extension structure

(3)

$$1 \longrightarrow \Pi \longrightarrow \widetilde{\Pi} \underset{\curvearrowleft}{\longrightarrow} \mathbb{Z}/n\mathbb{Z} \longrightarrow 1.$$

We [d2]denote by[i2] $\dot{\rho}$ [d3]the[i3] generator of $\mathbb{Z}/n\mathbb{Z}$, and we|to we identify ρ with[i4d4] the image of the latter in $\widetilde{\Pi}$, by the canonical splitting [d5]

$$\mathbb{Z}/n\mathbb{Z} \longrightarrow \widetilde{\Pi} \qquad 1 \bmod n \longmapsto \rho. \tag{4}$$

We thus have

$$\rho(g) = \rho g \rho^{-1} \qquad (g \in \Pi). \tag{5}$$

The splittings of the extension (3) correspond bijectively to the elements ρ' of $\widetilde{\Pi}$ over $\dot{\rho}$, such that

$$\rho'^{n} = 1. \tag{6}$$

To say that ρ' is over $\rho|\dot{\rho}$ means that we have

$$\rho' = \rho'_g \overset{\text{dfn}}{=} g\rho \qquad \text{with } g \in \Pi, \tag{7}$$

and in terms of such a $g \in \Pi$ equation (6) Is|is rewritten as follows

$$\boxed{g\rho(g)\rho^2(g)\cdots\rho^{n-1}(g) = 1} \tag{8}$$

d1
d2 d3
d4
d5

The group Π operates by conjugation on the set of splittings of the extension (3), or what amounts to the same thing, on the set of ρ' above $\rho|\dot{\rho}$, satisfying (6), [d6] We will moreover have, for $\alpha \in \Pi$

$$\begin{aligned} \alpha\rho'_g\alpha^{-1} &= \alpha g\rho\alpha^{-1} = \alpha g\rho\alpha^{-1}\rho^{-1}\rho \\ &= (\alpha g\rho(\alpha)^{-1})\rho = \rho'_{\alpha g\rho(\alpha)^{-1}} \end{aligned} \tag{9}$$

i.e. the operation by conjugation of Π on the set of splittings of (3), is interpreted as the operation $\Theta = \Theta_\rho$ of Π on the set of solutions of (8) given, for $\alpha \in \Pi$, by[i2]

$$\Theta_\rho(\alpha) : g \longmapsto \alpha g\rho(\alpha)^{-1} \tag{10}$$

(We will say that $\alpha g\rho(\alpha)^{-1}$ is the ρ-conjugate of g by the element $\alpha \in \Pi$). The Π-conjugacy classes of|of the splittings of (3) thus correspond to the Π-ρ-conjugacy classes of solutions of (8).

Among these classes, the "trivial"[i3] class [d8]of the splitting[i4] canonical for (3), i.e. the class of $g = 1$, is given parametrically [d9] as the set of

$$g = \alpha\rho(\alpha)^{-1} \qquad (\alpha \in \Pi). \tag{11}$$

Let g, g' be two congruent|conjugate solutions of

[p. 351]

the equation (8), so that we have

$$g' = \alpha g \rho(\alpha)^{-1} \qquad \text{i.e. } g' = \Theta(\alpha).g \tag{12}$$

for a suitable $\alpha \in \Pi$. When do we have uniqueness of the|of α – more generally, what can we say, for fixed g, g', of the set of $\alpha \in \Pi$ [d1] such that we have (12) (which we can call the ρ-transporter of g into g', in the group Π). [d2]It is[i1] obviously a right coset modulo|module the subgroup $\Pi(\rho, g)$ of Π which [d3] stabilizes g

$$\begin{aligned}
\Pi(\rho, g) &= \{\beta \in \Pi \mid \Theta_\rho(\beta).g = g\} \\
&= \{\beta \in \Pi \mid \beta g \rho(\beta)^{-1} = g\} \\
&= \{\beta \in \Pi \mid \{\mathrm{int}(\beta)\}(g\rho) = g\rho\} \\
&= \Pi^{\rho'_g} = \{\beta \in \Pi \mid \mathrm{int}(\underbrace{g\rho}_{\rho'_g})\beta = \beta\} \\
&= \text{Centralizer of } \rho'_g \text{ in } \Pi.
\end{aligned} \tag{13}$$

In other words, if α satisfies (12), the set of α' which satisfy the same relation is none other than the set $\alpha\Pi(\rho, g)$:

$$\begin{gathered}
\alpha' g \rho(\alpha')^{-1} = \alpha g \rho(\alpha)^{-1} \Longleftrightarrow \alpha' \in \alpha\Pi(\rho, g) = \alpha\Pi^{\rho'_g} \\
\text{i.e. } \alpha^{-1}\alpha' \in \Pi^{\rho'_g}
\end{gathered} \tag{14}$$

Thus we have uniqueness of the α satisfying (12) [d6] iff

$$\Pi^{\rho'_g} = 1, \tag{15}$$

a condition which depends only on the conjugacy class of the splitting [d7] of (3) defined by g i.e. by ρ'_g.

[scan 124]

In fact, not only the group Π, but the group $\widetilde{\Pi}$ itself operates by conjugation on the set of splittings of the extension (3), This is in particular so[i1] for ρ, and we have

$$\rho(\rho'_g) \overset{\text{dfn}}{=} \rho\rho'_g\rho^{-1} = \rho(g\rho)\rho^{-1} = (\rho g\rho^{-1}).\rho = g'_{\rho(g)}|\rho'_{\rho(g)}, \tag{16}$$

i.e. the operation of ρ on the set of splittings in question, is identified with the operation [d1] induced [d2]by|ρ the permutation ρ of Π on the set of solutions of (8) ($g \in \Pi$). Let us note moreover that g and $\rho(g)$ [d3] are Π-conjugate, for

$$\rho(g) = \alpha g\rho(\alpha)^{-1} \qquad \text{with } \alpha = g^{-1}. \tag{17}$$

Let us note that [d5]the operation of $\widetilde{\Pi}$[i3d6], on the set of splittings of (3), or again on the set of solutions of (8), is always|thus given by

$$\Theta_\alpha : g \longmapsto \alpha g\rho(\alpha)^{-1} \tag{10}$$

where now we assume $\alpha \in \widetilde{\Pi}$ (and not necessarily $\alpha \in \Pi$). The $\widetilde{\Pi}$-conjugacy classes are reduced|identical to the Π-conjugacy classes, (as it follows[i4] follows from (17)) [d7] In particular, if $\alpha \in \widetilde{\Pi}$, the element

$$\alpha\rho(\alpha)^{-1} \qquad (\alpha \in \widetilde{\Pi}) \tag{18}$$

of $\widetilde{\Pi}$ is in Π, and it [d8] satisfies (8), and

[p. 352]

is in the principal class, i.e. we will have d1

$$\alpha\rho(\alpha)^{-1} = \alpha_0\rho(\alpha_0)^{-1} \qquad \text{for } \alpha_0 \in \Pi \text{ suitable}$$

In fact, we can write $\alpha = \alpha_0\rho^i$, with $\alpha_0 \in \Pi$, $i \in \mathbb{Z}$[i1], whence $\rho(\alpha)^{-1} = \rho^{-i}\rho(\alpha_0)^{-1}$ whence (19). More generally, we will have, d2

$$\alpha = \alpha_0\rho^i \qquad (\alpha_0 \in \Pi,\ i \in \mathbb{Z})$$

the relation d4

$$\alpha g\rho(\alpha^{-1}) = \alpha_0\underbrace{\rho^i g\rho^{-i}}\rho(\alpha_0^{-1})|\rho(\alpha_0)^{-1}$$

$$= \alpha_0\rho^i(g)\rho(\alpha_0)^{-1}$$

with|for

$$\rho^i(g) = \beta g\rho(\beta)^{-1} \qquad \beta = (g\rho(g)\cdots\rho^{i-1}(g))^{-1}$$

thus

$$\begin{cases} \alpha g\rho(\alpha^{-1}) = (\alpha_0\beta)g\rho(\alpha_0\beta)^{-1} \\ \beta = (g\rho(g)\cdots\rho^{i-1}(g))^{-1} \end{cases} \tag{19}$$

(for $\alpha = \alpha_0\rho^i$, $i \in \mathbb{N}|\mathbb{N}^*$).

Of course, the representation (18) of a solution of equation (8), [d7] when we no longer assume $\alpha \in \Pi$ but only $\alpha \in \widetilde{\Pi}$, is no longer one-to-one, since for $\alpha = \rho$ for example we find [d8] $g = \rho\rho^{-1} = 1$.

[d9]Let us suppose[i3] more generally that we have a group [d10]

$$\mathcal{E}|\varepsilon \supset \widetilde{\Pi}$$

(as in the [d11] case where $\Pi = \Pi_{0,3}$, $\widetilde{\Pi}$ inverse image of $\{1, \dot\rho, \dot\rho^2\} \subset \mathfrak{S}_3$ in $\mathfrak{S}_{0,3}$ extension of $\mathcal{T}_{0,3}$ by $\Pi_{0,3}$), in which Π is normal, so that [d12]we have an extension[i4]

d1

$$(20) \qquad 1 \longrightarrow \Pi \longrightarrow \mathcal{E}|\varepsilon \longrightarrow G \longrightarrow 1$$

m797

Marginal note. m797 N.B. the extension (3) is the inverse image of (20) under the inclusion $\mathbb{Z}/n\mathbb{Z} \hookrightarrow G$

with

$$(21) \qquad \mathbb{Z}/n\mathbb{Z} \hookrightarrow G, \qquad 1 \bmod n \longmapsto \dot{\rho} \in G$$

(element of order n)i1 $\widetilde{\Pi}$ being identified with the inverse image of $\mathbb{Z}/n\mathbb{Z}$ in $\mathcal{E}|\varepsilon$.

We cannot say in general, if ρ' is an element of $\mathcal{E}|\varepsilon$ above $\dot{\rho}$ (thus $\rho' \in \widetilde{\mathcal{E}|\varepsilon}$). (even if it satisfies $\rho'^n = 1$), that for $\forall\ \alpha \in \mathcal{E}|\varepsilon$, $\mathrm{int}(\alpha)(\rho')$ is still above $\dot{\rho}$: for this to be so, it is necessary and sufficient that $\dot{\alpha} \in G$ centralize $\dot{\rho}$. So let $\mathcal{E}|\varepsilon_\rho$

$$(22) \qquad \mathcal{E}|\varepsilon_\rho = \{\alpha \in \mathcal{E}|\varepsilon \mid [\dot{\alpha}, \dot{\rho}] = 1\}$$

it is a subgroup of $\mathcal{E}|\varepsilon$ containing $\widetilde{\Pi}$, which d2itselfi2 operates on the set of d3 ρ' above $\dot{\rho}$, in particular on d4 the set of [illeg. 1] whichi3 satisfying (8), d5 by the same operation

$$(23) \qquad \alpha\rho'_g\alpha^{-1} = \rho'_{\alpha g \rho(\alpha)^{-1}}$$

so that we can also consider this operation as given by

$$(24) \qquad \begin{cases} \Theta_{\rho,\mathcal{E}|\varepsilon_\rho}(\alpha) = \Theta(\alpha) : g \longmapsto \alpha g \rho(\alpha)^{-1} \\ (\alpha \in \mathcal{E}|\varepsilon_\rho). \end{cases}$$

This time, an operation $\Theta(\alpha)$ may permute the Π-conjugacy classes of the d6 solutions, of (8) in Π. We|It d7 will have on $\mathcal{E}|\varepsilon_\rho$

an extension structure

$$(25)\qquad \begin{array}{ccccccccc} 1 & \longrightarrow & \Pi & \longrightarrow & \mathcal{E}|\varepsilon_{\rho} & \longrightarrow & G^{\rho} & \longrightarrow & 1 \\ & & & & & & \| & & \\ & & & & & & \mathrm{Centr}_G(\rho) = \{g \in G \mid \rho g g|\rho^{-1} = g\} & & \\ & & & & & & = \{g \in G \mid [\rho, g] = 1\} & & \end{array}$$

and $\mathcal{E}|\varepsilon_{\rho}$ operates on the set of Π-conjugacy classes of splittings of (3), (or the Π-ρ-conjugacy classes of solutions of (8)) via an operation of G^{ρ} on it.

Let $\alpha \in \mathcal{E}|\varepsilon$, let us consider the element

$$\alpha\rho(\alpha)^{-1} = \alpha(\rho\alpha\rho^{-1})^{-1} = \alpha\rho\alpha^{-1}\rho^{-1} = [\alpha, \rho]$$

It is in Π iff we have [d4]

$$[\dot{\alpha}, \dot{\rho}] = 1 \qquad \text{i.e.} \quad \dot{\alpha} \in G^{\rho} \qquad \text{i.e.} \quad \alpha \in \mathcal{E}|\varepsilon_{\rho}.$$

For a solution g of equation (8), it may happen that we cannot put it|it in the standard[i1] form $\alpha\rho(\alpha)^{-1}$ with $\alpha \in \Pi$, but that we succeed with $\alpha \in \mathcal{E}|\varepsilon_{\rho}$. For such an α to exist, it is necessary and sufficient that the $\Pi\rho$-conjugacy class $[g]_{\rho}$[i2] of g (among the solutions of (8)) be in the orbit of the trivial conjugacy class $[1]_{\rho}$[i3], for the action under consideration of G^{ρ} on this set of conjugacy classes; [d5]then[i4] the $\alpha \in \mathcal{E}|\varepsilon_{\rho}$ which satisfy

$$(26)\qquad g = \alpha\rho(\alpha)^{-1}$$

d1 d2 d3 satisfy the relation[i1]

$$\dot\alpha[1]_\rho = [g]_\rho, \tag{27}$$

and for $\forall\ \dot\alpha \in G^\rho$ satisfying this relation (27), there exists at least one representative $\alpha \in \mathcal{E}|\varepsilon_\rho$ satisfying (6) (which is pure tautology).

Under what condition do we have uniqueness of the|of the $\alpha \in \mathcal{E}|\varepsilon_\rho$ satisfying (26)? The set of these α is a right coset under the subgroup of $\mathcal{E}|\varepsilon_\rho$ formed of the α such that [d4]

$$\alpha\rho(\alpha)^{-1} = 1 \qquad \text{i.e.} \quad \alpha = \rho(\alpha) \qquad \text{i.e.} \quad [\alpha, \rho] = 1,$$

this group is none other than [d5]

$$\mathcal{E}|\varepsilon^\rho = \mathrm{Centr}_{\mathcal{E}|\varepsilon}(\rho) \subset \mathcal{E}|\varepsilon_\rho. \tag{28}$$

which group contains ρ hence the sub-[i2]group $\simeq \mathbb{Z}/n\mathbb{Z}$ of $\mathcal{E}|\varepsilon$[i3] generated by ρ – so it is never trivial – i.e. we never have uniqueness (except in the trivial case where [d6] $n = 1$ i.e. $\rho = 1$, [d7] but then $\mathcal{E}|\varepsilon^\rho = \mathcal{E}|\varepsilon$ and we would need $\mathcal{E}|\varepsilon = 1$ …!)

But if we assume $\Pi^\rho = \{1\}$ i.e.

$$\mathcal{E}|\varepsilon^\rho \cap \Pi = \{1\} \tag{29}$$

[d8]

$$\mathcal{E}|\varepsilon^\rho \underset{\text{injective}}{\overset{\text{can}}{\hookrightarrow}} G^\rho \subset G,$$

then the $\alpha \in \mathcal{E}|\varepsilon^\rho$ solutions of (26) are in one-to-one correspon-

is in 1-1 correspondence with the set of elements of $\widetilde{\Pi}_{0,3} = \mathcal{E}|\varepsilon'$ (the unoriented weighted triangulated[i1] cartographic group, having as generators the elements $\tau_0, \tau_1, \tau_\infty$ related by the

relations $\tau_0^2 = \tau_1^2 = \tau_\infty^2 = 1$ and no more, with $l_0 = \tau_\infty\tau_1$, $l_1 = \tau_0\tau_\infty$, $l_\infty = \tau_1\tau_0$ …) It should still be likewise when we place ourselves in the groups $\Pi^\wedge_{0,3}$ and $\widetilde{\Pi}^\wedge_{0,3} = \widetilde{\Pi}_{0,3} \cdot \{1, \tau_\infty\}$, if we admit (something to be checked later)

$$(33) \qquad (\widetilde{\Pi}^\wedge_{0,3})^\rho = \{1\}$$

and that the elements of finite order of $\widehat{\mathfrak{S}}_{0,3}$ are conjugates of elements of finite order of $\mathfrak{S}_{0,3}$ …[i2]

Let us note that here we have

$$(34) \qquad \tau_\infty\rho(\tau_\infty)^{-1} = \tau_\infty\rho(\tau_\infty) = l_1^{-1},$$

in virtue of the formulas (23) of § 42

$$\rho_\infty \overset{\text{dfn|definition}}{=} \tau_\infty\rho\tau_\infty^{-1} = l_1^{-1}\rho = \rho l_0^{-1}.$$

The situation is even simpler for the element|element σ_∞ of $\mathfrak{S}_{0,3}$, operating on Π by an automorphism of order $n = 2$, for here every solution of the corresponding equation

$$(35) \qquad h\,\sigma_\infty(h) = 1 \qquad (h \in \Pi)$$

can be put in the standard form

$$(36) \qquad h = \beta\sigma_\infty(\beta)^{-1} \qquad (\beta \in \Pi)$$

and this in a unique way. This follows indeed from the general theory …, taking into account that

$$(37) \qquad U_{0,3}^{\dot{\sigma}_\infty} = \{\tfrac{1}{2}\}$$

Scans 131–149

[scan 131]

[p. 355]

the set of fixed points of $U_{0,3}$ under $\dot\sigma_\infty$ is reduced to a single element, which also implies that [d1]

$$\Pi_{0,3}^{\sigma_\infty} = \{1\}.$$

We shall also assume that these facts extend to the elements of $\widehat\Pi_{0,3}$ — which will be the case if (in addition to what has been assumed about it with regard to ρ) we assume that we still have

$$\widehat\Pi_{0,3}. \tag{38}$$

Note that here we have

$$G^{\sigma_\infty} = \mathcal{T}_{0,3}^{\sigma_\infty} \simeq \mathbb{Z}/2\mathbb{Z} \times \mathbb{Z}/2\mathbb{Z}, \tag{39}$$

subgroup generated by $\dot\sigma_\infty, \dot\tau|\tau$, whose nonzero elements are $\dot\sigma_\infty, \tau, \dot\tau'_\infty$ — which lift to $\sigma_\infty, \tau_\infty, \tau'_\infty$; and we have

$$\mathcal{E}^{\sigma_\infty} = \mathcal{G}_{0,3}^{\sigma_\infty} \simeq \mathbb{Z}/2\mathbb{Z} \times \mathbb{Z}/2\mathbb{Z}, \tag{40}$$

group generated by $\sigma_\infty, \tau_\infty$ (the other nontrivial element being τ'_∞). If then we write a solution $h\in\pi$ (of (35) in the form (36)), with $\beta \in \mathcal{G}_{0,3}$ only (not only $\beta \in \pi$), then the indeterminacy is in the group (40) of order (4) ; More precisely, if β_0 is the solution in π, then the other solutions are of the form

$$\beta = \beta_0 \sigma_\infty^{\varepsilon} \tau_\infty^{\varepsilon'} \qquad \varepsilon, \varepsilon' \in \mathbb{Z}/2\mathbb{Z} \tag{41}$$

[p. 356]

m801

Marginal note. [m801] These notations will be revised once again in § 46

44 Return to the notation. Setting up equations in $\mathrm{Sl}(2, \widehat{\mathbb{Z}})$.

Let u be an automorphism of $\widehat\Pi_{0,3}$ commuting up to inner automorphisms : $\mathcal{G}_3$ [d1i1] — or what amounts to the same, an automorphism of $\widehat{\mathcal{G}}_{0,3}^+$ which induces the identity in $\mathcal{T}_{0,3}^+ = \mathcal{G}_3$. Then u is known when we know its actions on the two generators σ_∞, ρ of $\widehat{\mathcal{G}}_{0,3}^+$, which will resp. be elements of $\widehat{\mathcal{G}}_{0,3}^+$ over $\dot\sigma_\infty$ and $\dot\rho$,

namely

$$\boxed{u(\sigma_\infty) = h\sigma_\infty, \qquad u(\rho) = g\rho} \qquad (h, g \in \widehat\Pi_{0,3}) \tag{1}$$

where h, g are subject to the conditions

$$\boxed{h\sigma_\infty(h) = 1 \qquad g\rho(g)\rho^2(g) = 1}, \tag{2}$$

expressing respectively the relations

$$\boxed{(h\sigma_\infty)^2 = (g\rho)^3 = 1}. \tag{3}$$

(There is in addition the preliminary condition to check — namely that (3) are defining relations for $\widehat{\mathcal{G}}^+_{0,3}$ …).

[d2]For the moment[i2], there is no need to impose any relation between g and h — except the relations (2) on each of these elements — since $\widehat{\mathcal{G}}^+_{0,3}$ is the group with defining relations

$$\sigma_\infty^2 = \rho^3 = 1.$$

[scan 134]

The elements g and h, thus taken as automorphisms of $\widehat{\Pi}_{0,3}$, express the commutation relations of[d1] u with [d2] ρ and σ_∞ respectively :

$$[u,\rho] = \underbrace{u\rho u^{-1}}_{u(\rho)}\rho^{-1} = \mathrm{int}(g), \qquad [u,\sigma_\infty] = u\sigma_\infty u^{-1}\sigma_\infty = \mathrm{int}(h) \tag{4}$$

— it is a remarkable thing that knowledge of the elements g, h of π satisfying (4), already implies|imply knowledge of u (this|which to the fact that σ_∞, ρ generate $\mathcal{G}^+_{0,3}$ …).

Let us now write the compatibility of u with the loop structure, [d3]We had it[i1] [d4]expressed|expressed[i2] previously by a relation of the form

$$u(\varepsilon_0) = \mathrm{int}(g_0)(\varepsilon_0^p) \quad \text{or} \quad u(\ell_0) = \mathrm{int}(g_0)\ell_0^p,$$

for

$$p \in \widehat{\mathbb{Z}}^*, \qquad g_0 \in \widehat{\Pi}_{0,3}$$

suitably chosen. The notation g_0 is not all that happy, since g and g_0 play quite dissimilar roles. The subscript 0 in g_0 was intended to allow us to write, more generally

$$u(\ell_i) = \mathrm{int}(g_i)\ell_i^p \qquad i \in \{0, 1, \infty\}.$$

[scan 135]

[p. 357]

I prefer to use the letter f_0 — with the option of dropping the subscript if no confusion is possible. The letter p for a multiplier is not a choice[i1] that is very happy, for later on [d1] we shall surely[i2] need this letter to denote a characteristic — I prefer the letter μ (Greek initial of "multiplier"), and the loop relation would[i3] therefore take the form

$$u(\varepsilon_0) = \mathrm{int}(f_0)\varepsilon_0^{\mu}.$$

In fact, I prefer to replace f_0 in it by f_0^{-1}, to obtain later on formulas in which the symmetry of the roles played by ρ and by σ_∞ appears more clearly. — in particular I would like the formula defining h_0 in terms of g_0 (§ 43, formula (65,)

$$h_0 = g_0^{-1}\sigma_\infty(g_0)$$

to become instead

$$h_0 = g_0\sigma_\infty(g_0)^{-1},$$

in harmony with

$$\xi = \lambda\rho(\lambda)^{-1} \quad \ldots$$

Thus the "loop|loop relation" takes the form

$$u(\varepsilon_0) = \mathrm{int}(f_0^{-1})\varepsilon_0^{\mu} \qquad f_0 \in \widehat{\Pi}_{0,3},\ \mu \in \widehat{\mathbb{Z}}^*, \tag{5}$$

[d4]

$$u(\ell_0) = \mathrm{int}(f_0^{-1})\ell_0^{\mu}, \tag{6}$$

from which we immediately deduce 134

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 136]

$$\begin{cases} u(\varepsilon_1) = \mathrm{int}(f_1^{-1})(\varepsilon_1^{\mu}), & u(\ell_1) = \mathrm{int}(f_1^{-1})(\ell_1^{\mu}), \\ u(\varepsilon_\infty) = \mathrm{int}(f_\infty^{-1})(\varepsilon_\infty^{\mu}), & u(\ell_\infty) = \mathrm{int}(f_\infty^{-1})(\ell_\infty^{\mu}), \end{cases} \tag{7}$$

where|or

$$f_1 = \rho(f_0)g^{-1}, \qquad f_\infty = \rho(f_1)g^{-1} = \rho^2(f_0)\rho(g)^{-1}g^{-1}. \tag{8}$$

In what follows, we shall simply write f instead of f_0, and we are going to transform equation (5) [d1] into

$$\mathrm{int}(f)u(\varepsilon_0) = \varepsilon_0^{\mu}, \tag{8bis}$$

by making the left-hand side explicit

$$\begin{aligned} \mathrm{int}(f)u(\varepsilon_0) = f\,u(\sigma_\infty\rho)f^{-1} = f\underbrace{u(\sigma_\infty)}_{h\sigma_\infty}\underbrace{u(\rho)}_{g\rho}\,f^{-1} = fh\sigma_\infty g\rho f^{-1} \\ = fh\sigma_\infty g\sigma_\infty^{-1}\underbrace{\sigma_\infty\rho}_{\varepsilon_0}\,f^{-1} = fh\sigma_\infty(g)\,\underbrace{\varepsilon_0 f^{-1}\varepsilon_0^{-1}}\,\varepsilon_0 \end{aligned}$$

i.e.

$$\mathrm{int}(f)u(\varepsilon_0) = [fh\sigma_\infty(g)(\sigma_\infty\rho)(f)^{-1}]\varepsilon_0 = [f, h\sigma_\infty(g\rho(f)^{-1}]\varepsilon_0 \tag{9}$$

where the four|three factors $f, h, \sigma_\infty(g\rho(f)^{-1}$ in [ ] are $\in \widehat{\Pi}_{0,3}$. Thus (5)|(9) or (8), takes the form

$$fh\sigma_\infty(g\rho(f)^{-1}) = \varepsilon_0^{\mu-1}$$

which gives, setting

$$\mu - 1 = 2\nu \qquad (\nu \in \widehat{\mathbb{Z}}) \tag{10}$$

(so we write ν for what was denoted by γ previously) we find the relation

$$fh\sigma_\infty(g\rho(f)^{-1}) = \ell_0^{\nu}$$

or again, transforming by σ_∞

$$\sigma_\infty(f)\sigma_\infty(h)g\rho(f)^{-1} = \ell_1^{\nu}$$

; that is

[scan 137]

[p. 358]

$$\boxed{\sigma_\infty(h).g = \sigma_\infty(f)^{-1}\ell_1^\nu\rho(f)}. \qquad (11)$$

This relation, which relates h and g via f, can rightly be called the "loop relation". We see, from this relation, that [d1] not only does knowledge of u i.e.[i1] of the|of h and g determine f and μ i.e. f and ν, but also conversely, once f and ν are known, g and h determine each other via (11).

m806

Marginal note. [m806] f determined modulo L_0 only $f \mapsto \ell_0^n f$ ($n \in \widehat{\mathbb{Z}}$).

Note that for u corresponding to : [d2], g, h, f, if $\gamma \in \widehat{\Pi}_{0,3}$, the automorphism $u' =$[i2] $\mathrm{int}(\gamma) \circ u$ corresponds to

$$g' = \gamma g \rho(\gamma^{-1}), \quad h' = \gamma h \sigma_\infty(\gamma)^{-1}, \quad f' = f\gamma^{-1}. \qquad (12)$$

m807

Marginal note. [m807] This holds more generally if $\gamma \in \widetilde{\mathcal{G}}_{0,3}|\mathcal{G}_{0,3}$, and even for $\gamma \in \widehat{\widetilde{\mathcal{G}}}_{0,3}|\widehat{\mathcal{G}}_{0,3}$.

The equations (2) "in h" and "in g" are solved parametrically in a unique way by

$$g = \alpha\rho(\alpha)^{-1}, \quad h = \beta\sigma_\infty(\beta)^{-1} \qquad (13)$$

where

$$\begin{cases} \alpha \in \widehat{\widetilde{\Pi}}_{0,3} = \widehat{\Pi}_{0,3}.\{1, \tau_\infty\} \\ \beta \in \widehat{\Pi}_{0,3} \end{cases} \qquad (14)$$

to be precise, giving g, h satisfying (2) is equivalent resp. to giving α, β in $\widehat{\widetilde{\Pi}}_{0,3}$ and $\widehat{\Pi}_{0,3}$, via the formulas (13). 136

[scan 138]

The elements[i1] g and h being thus made explicit in terms of α and β, the loop[i2] relation (11) can be considered as a relation between α, β, f, ν

$$\sigma_\infty(\beta\sigma_\infty(\beta)^{-1})(\alpha\rho(\alpha)^{-1}) = \sigma_\infty(f)^{-1}\ell_1^\nu\rho(f), \qquad (15)$$

where [d1] ν is uniquely determined by α, β, and f is determined in $L_0\backslash\widehat{\Pi}_{0,3}$. (We shall note that the right-hand side of (15) does not change, on changing f to $\ell_0^n f$, with $n \in \widehat{\mathbb{Z}}$).

The main asymmetry, it seems to me, between σ_∞ and ρ in this theory, is that [d2] we always have $\beta \in \widehat{\Pi}_{0,3}$, whereas α is not necessarily in $\widehat{\Pi}_{0,3}$ – it is, as we have seen, iff $\nu \equiv 0$ (3) i.e. $\mu \equiv 1$ (3).

[d3] The automorphism

$$u' = \mathrm{int}(\beta^{-1})u$$

will therefore be congruent to u modulo inner automorphisms, and will correspond to

$$\begin{cases} g' = \beta^{-1}g\rho(\beta) = (\beta^{-1}\alpha)\rho(\beta^{-1}\alpha)^{-1} \\ h' = \beta^{-1}h\sigma_\infty(\beta) = 1 \\ f' = f\beta \end{cases} \qquad (16)$$

– thus u is [d4] congruent modulo[i3] inner automorphisms 137

[scan 139]

[p. 359]

to a unique u' such that $u'(\sigma_\infty) = \sigma_\infty$ i.e. a u' which commutes with σ_∞. But in the symmetric notation|the symmetric notations we shall take

$$u'' = \mathrm{int}(\alpha^{-1})u$$

corresponding to

$$\begin{cases} g'' = \alpha^{-1}g\rho(\alpha) = 1 \\ h'' = \alpha^{-1}h\sigma_\infty(\alpha) = (\alpha^{-1}\beta)\sigma_\infty(\alpha^{-1}\beta)^{-1} \\ f'' = f\alpha \end{cases} \qquad (17)$$

but u'' will be only $\widehat{\widetilde{\Pi}}_{0,3}$-[i1]conjugate [d1] of $u''|u$ – it will be $\widehat{\Pi}_{0,3}$-[i2]conjugate to an [d2] automorphism[i3] which commutes with ρ iff g is $\Pi_{0,3}$-ρ-conjugate to 1 i.e. iff $\alpha \in \widehat{\Pi}_{0,3}$ i.e. iff $\mu \equiv 1$ (3) or again $\nu \equiv 0$ (3).

[d3] The calculations of the preceding §§ concerned the case where $h = 1$, i.e. u commutes with σ_∞ – so [illeg. 1] there remain the quantities g and f, [d4] plus the multiplier μ[i4] [d5] – once μ is known i.e. ν known, g and f determine one another by (11) (f remaining an element of $L_0\backslash\widehat{\Pi}_{0,3}$).

m810

Marginal note. [m810] We shall see that μ is already determined by f, at least modulo sign, cf. below.

For fixed f, the equation in g can be interpreted as an equation in f, or better, introducing

$$\varphi = f\sigma_\infty(f)^{-1} \qquad (12)$$

m811

Marginal note. [m811] This notation is useful|valid only if $\beta = 1$ [illeg. 2]

m812

Marginal note. [m812] it is essentially the element denoted h_0 previously

an "equation in φ" –

$$(\ell_0^\nu\varphi)\rho(\ell_0^\nu\varphi)\rho^2(\ell_0^\nu\varphi) = 1, \qquad (13)$$

or again, putting

$$\boxed{\xi = \ell_0^\nu\varphi \quad \text{i.e. } \varphi = \ell_0^{-\nu}\xi} \qquad (14)$$

we can interpret it as "equation in ξ"

$$\xi\rho(\xi)\rho^2(\xi) = 1. \qquad (15)$$

Thus, the loop automorphisms of $\widehat{\Pi}_{0,3}$ which commute with σ_∞, with multiplier $\mu = 2\nu + 1$,[i1] correspond to the pairs of solutions (ξ, φ) of the equations

$$\boxed{\varphi\sigma_\infty(\varphi) = 1 \qquad \xi\rho(\xi)\rho^2(\xi) = 1} \qquad (16)$$

m814

Marginal note. [m814] We shall find|find that both ξ and φ already determine μ, hence ν.

satisfying in addition the compatibility condition (14) (particularly simple [d1] if $\mu = 1$ i.e. [d2] $\nu = 0$, since then $\varphi = \xi$!). We recover g (hence u) [d3] as a function [d4] of (φ, ξ) by the loop formula (11), which here takes the form

$$g = \sigma_\infty(f)^{-1}\ell_1^\nu\rho(f) = (\ell_0^\nu f)^{-1}(\underbrace{\ell_0^\nu\varphi}_{\xi})\rho(\ell_0^\nu f) \qquad (17)$$

$f \in \widehat{\Pi}_{0,3}$ being uniquely determined in terms of φ by formula (12).

Symmetrically, we are going to look at the loop automorphisms u of $\Pi_{0,3}$ which com- 139

[scan 141]

[p. 360]

mute with ρ, i.e. those for which we have $g = 1$, hence described in terms of h, f,

$$u(\sigma_\infty) = h\sigma_\infty, \quad u(\rho) = 1 \qquad (18)$$

$$u(\varepsilon_0) = \mathrm{int}(f^{-1})(\varepsilon_0^\mu) \qquad (19)$$

this last relation taking the form (11)

$$\sigma_\infty(h) = \sigma_\infty(f)^{-1}\ell_1^\nu\rho(f), \qquad (20)$$

which can also be written, applying σ_∞

$$h = f^{-1}.\ell_0^\nu.(\sigma_\infty\rho)(f) = \,|\, = \qquad (21)$$

"The equation in h" (2) the

$$h\sigma_\infty(h) = 1 \qquad (*)$$

is thus written as an "equation in f", [d2] with[i1]

$$h\sigma_\infty(h) = f^{-1}\ell_0^\nu \underbrace{(\sigma_\infty\rho)(f)\sigma_\infty(f)^{-1}}_{\sigma_\infty(\underbrace{\rho(f)f^{-1}}_{\psi^{-1}})}\ell_1^\nu\rho(f)$$

so this is written, in terms of $\psi = f\rho(f)^{-1}$

$$\underbrace{\ell_0^\nu\sigma_\infty(\psi^{-1})}\,\ell_1^\nu\,\underbrace{\rho(f)f^{-1}}_{\psi^{-1}} = 1$$

i.e. (passing to the inverse)

$$\psi\ell_1^{-\nu}\underbrace{\sigma_\infty(\psi)\ell_0^{-\nu}}_{\sigma_\infty(\psi\ell_1^{-\nu})} = 1 \quad \text{i.e.} \quad \underbrace{\ell_0^{-\nu}\psi}_{\eta}\,\underbrace{\ell_1^{-\nu}\sigma_\infty(\psi)}_{\sigma_\infty(\underbrace{\ell_0^{-\nu}\psi}_{\eta})} = 1.$$

[d4] Thus, putting

$$\psi \overset{\text{dfn}}{=} f\rho(f)^{-1} \qquad (22)$$

$$\boxed{\eta = \ell_0^{-\nu}\psi \quad \text{i.e. } \psi = \ell_0^\nu\eta} \qquad (23)$$

, we find that the loop automorphisms u of $\widehat{\Pi}_{0,3}$ which commute with ρ correspond to the triples (η, ψ, ν), $\eta, \psi \in \widehat{\Pi}_{0,3}$, $\nu \in \widehat{\mathbb{Z}}$ (with $2\nu + 1 \in \widehat{\mathbb{Z}}^*$), satisfying 140

[scan 142]

$$\boxed{\psi\rho(\psi)\rho^2(\psi) = 1, \qquad \eta\sigma_\infty(\eta) = 1}, \qquad (24)$$

m817

Marginal note. m817 We shall find [illeg. 1] again, by both ψ and η

and in addition the compatibility relation (23) – particularly simple if $\mu = 1$ i.e. if $\nu = 0$, for then it means $\psi = \eta$! But in addition to these relations, we must assume that the solution ψ of equation (24) "in ψ" belongs|belong to the principal family, i.e. that, when we write ψ in parametric form

$$\psi = f\rho(f)^{-1} \qquad (22)$$

with $f \in \widehat{\widetilde{\Pi}}_{0,3} = \widehat{\Pi}_{0,3}.\{1, \tau_\infty\}$, we indeed have $f \in \widehat{\Pi}_{0,3}$ (hence that the image of f in $\widehat{\widetilde{\Pi}}_{0,3}/\widehat{\Pi}_{0,3} \simeq \{1, \tau_\infty\} \simeq \mathbb{Z}/2$ is zero…).

Having thus determined f as a function of ψ, determine|determines h by (21), whence u d1.

Remarks 1) If this additional condition on ψ is not satisfied, the d2 formula (21) still makes sense and defines $h \in \widehat{\Pi}_{0,3}$, satisfying "the equation in h" $h\sigma_\infty(h) = 1$ hence defining an automorphism u of $\widehat{\Pi}_{0,3}$, commuting with ρ.

We shall then have

$$u(\ell_0) = \mathrm{int}(f^{-1})(\ell_0^\mu)$$

or again, putting

$$f = \tau_\infty f_0 \qquad \text{with } f_0 \in \widehat{\Pi}_{0,3}$$
$$u(\ell_0) = \mathrm{int}(f_0^{-1})(\tau_\infty(\ell_0^\mu)) = \mathrm{int}(f_0^{-1})(\ell_0^{-\mu})$$

[p. 361]

i.e. u is a loop automorphism, with multiplier $-\mu = -(2\nu + 1)$.

2) Let us note that the indeterminacy of f (for fixed u, i.e. fixed g, h) lies in

$$f \longmapsto f' = \ell_0^n f \qquad (n \in \widehat{\mathbb{Z}}) \qquad (25)$$

which gives

$$\begin{cases} \varphi \longmapsto \varphi' = \ell_0^n \varphi \ell_1^{-n}, & \psi \longmapsto \psi' = \ell_0^n \psi \ell_1^{-n}, \\ \xi \longmapsto \xi' = \ell_0^n \xi \ell_1^{-n}, & \eta \longmapsto \eta' = \ell_0^n \eta \ell_1^{-n}, \end{cases} \qquad (26)$$

m819

Marginal note. m819 N.B. We similarly have $\alpha_0 \longmapsto \alpha_0' = \ell_0^n \alpha_0$ $\beta_0 \longmapsto \beta_0' = \ell_0^n \beta_0$.

(N.B. we have $\ell_1 = \sigma_\infty(\ell_0) = \rho(\ell_0)$, so ξ' and ψ' are the ρ-transforms of ξ, ψ by $\ell_0^{-n}|\ell_0^n$, and φ', η' the σ_∞-transforms of φ, η by $\ell_0^{-n}|\ell_0^n$ — in particular the equations (16) (in φ and in ξ) and (24) (in ψ and in η) are indeed invariant under these transformations, as are moreover the compatibility relations (14) resp. (23).

3) We have the following formulas (rewriting of (11))[i1]

$$\sigma_\infty(h)g = (\ell_0^\nu f)^{-1}\xi\rho(\ell_0^\nu f) = \sigma_\infty(f^{-1}\ell_0^\nu)\eta(f^{-1}\ell_0^\nu)^{-1} \tag{27}$$

[d2] — expressing $\sigma_\infty(h)g$ as the ρ-conjugate of ξ by $(\ell_0^\nu f)^{-1}$, and symmetrically [d3] as the σ_∞-conjugate of η by $\sigma_\infty(f^{-1}\ell_0^\nu)$. If $h = 1$, it is the first expression that is interesting (implying the equation in ξ), for $g = 1$, it is the second, which we can also rewrite (applying σ_∞ to the 2 sides)[i3]

$$h = (f^{-1}\ell_0^\nu)(\eta^{-1})\sigma_\infty(f^{-1}\ell_0^\nu)^{-1} \tag{28}$$

[scan 144]

expressing h as σ_∞-transform of η^{-1} by $f^{-1}\ell_0^\nu$. If we want to express it as σ_∞-[i1]transform of η (instead of $\sigma_\infty(\eta) = \eta^{-1}$), we write

$$\eta^{-1} = \sigma_\infty(\eta) = \eta^{-1}.\eta.\sigma_\infty(\eta)$$

whence

$$h = (f^{-1}\ell_0^\nu\eta^{-1})\eta\sigma_\infty(f^{-1}\ell_0^\nu\eta^{-1})^{-1}. \tag{28bis}$$

These formulas allow us to relate, in the case $h = 1$ the solutions of the [d2] equations

$$g = \alpha\rho(\alpha)^{-1} \qquad \text{and} \qquad \xi = \alpha_0\rho(\alpha_0)^{-1} \tag{29}$$

by

$$\alpha = (\ell_0^\nu f)^{-1}\alpha_0 = f^{-1}\ell_0^{-\nu}\alpha_0, \tag{30}$$

and in the case where $g = 1$, the solutions of the two equations

$$h = \beta\sigma_\infty(\beta)^{-1}, \qquad \eta = \beta_0\sigma_\infty(\beta_0)^{-1} \tag{31}$$

by

$$\beta = (f^{-1}\ell_0^{\nu}\eta^{-1})\beta_0. \tag{32}$$

The asymmetry between these two formulas ((32) being a little more complicated than (30) by the extra factor η^{-1} in the coefficient of β_0) comes from the fact that f was defined via the loop formula|formulas (6), first form, where ℓ_0 is defined as the square of $\sigma_\infty\rho = \varepsilon_0$, and not of $\rho\sigma_\infty = \varepsilon_1$ 143

of $\varepsilon_0 \in \mathrm{Sl}(2, \widehat{\mathbb{Z}})'$ in $\mathrm{Sl}(2, \widehat{\mathbb{Z}})$ there is sign ambiguity

$$\varepsilon_0 = \pm \begin{pmatrix} 1 & -1 \\ 0 & 1 \end{pmatrix},$$

m823

Marginal note. m823 though the sign − would hardly be a reasonable choice — one likes to see a unipotent element d1 generating a 1-parameter subgroup…

but for

$$\ell_0 = \varepsilon_0^2 = \begin{pmatrix} 1 & -2 \\ 0 & 1 \end{pmatrix} \tag{39}$$

there is no ambiguity of sign. This being so, the relations

$$\xi = \ell_0^{\nu}\varphi \qquad (\text{case } h = 1) \tag{40}$$

and

$$\eta = \ell_0^{-\nu}\psi \qquad (\text{case } g = 1) \tag{41}$$

are they true without a correcting sign ??|?!

The case $h = 1$ corresponds to the data (in $\widehat{\widetilde{\Pi}}_{0,3}$) of ξ and f, and ν,[i1] satisfying

$$\xi\rho(\xi)\rho^2(\xi) = 1, \qquad \xi = \ell_0^{\nu}(\underbrace{f\sigma_\infty(f)^{-1}}_{\varphi}),$$

[d3] or again to the data [d4]

$$\alpha_0 \in \widehat{\widetilde{\Pi}}_{0,3}, \quad f \in \widehat{\Pi}_{0,3}, \quad \nu \in \widehat{\mathbb{Z}}$$

satisfying the relations

$$\underbrace{\alpha_0\rho(\alpha_0)}_{\xi} = \ell_0^{\nu}\,\underbrace{f\sigma_\infty(f)^{-1}}_{\varphi} \tag{42}$$

in terms of these data we define

$$\begin{cases} \xi = \alpha_0\rho(\alpha_0) \\ \varphi = f\sigma_\infty(f)^{-1} \\ g = \sigma_\infty(f)^{-1}\ell_1^{\nu}\rho(f) = (\ell_0^{\nu}f)^{-1}(\ell_0^{\nu}\varphi)\rho(\ell_0^{\nu}f) \end{cases} \tag{43}$$

This recalled, we lift α_0, f to $\mathrm{Gl}(2,\widehat{\mathbb{Z}})^{\pm 1}$, 145

[p. 363]

with sign ambiguity, [d1] and [d2]ξ and φ[i1] are thus determined in Sl|Gl$(2,\widehat{\mathbb{Z}})$, independently of the choices of signs, [d3] and likewise g.

We will have|have therefore in $\mathrm{Sl}(2,\widehat{\mathbb{Z}})$

$$\xi = \varepsilon \ell_0^\nu \varphi \qquad \text{i.e.} \qquad \alpha_0 \rho(\alpha_0) = \varepsilon \ell_0^\nu f \sigma_\infty(f)^{-1}, \tag{44}$$

in $\mathrm{Sl}(2, \widehat{\mathbb{Z}})$,[i2] with a sign $\varepsilon \in \{\pm 1\}$ that is well determined, and the question that arises is whether we always|always have $\varepsilon = +1$.

[d5] Let us note that the formula[i3]

$$\rho(\ell_0) = \ell_1$$

is true in $\mathrm{Sl}(2, \widehat{\mathbb{Z}})$ (without a correcting sign) so the last[i4] expression for g in (43) is valid in $\mathrm{Sl}(2, \widehat{\mathbb{Z}})$ (without a sign), which shows that $g \in \mathrm{Sl}(2, \widehat{\mathbb{Z}})$, [d6] is a ρ-transform of $\ell_0^\nu \varphi$, [d7] the latter is a ρ-transform of g. [d8] We have[i5]

$$g \rho(g) \rho^2(g) = \varepsilon_0 . 1 \qquad \varepsilon \in \{\pm 1\},$$

and [d10] we deduce from this, if $g' = \alpha g \rho(\alpha)^{-1}$ [d11] ($\alpha \in \mathrm{Gl}(2, \widehat{\mathbb{Z}})$), that we have

$$g' \rho(g') \rho^2(g') = \varepsilon_0 . 1$$

hence in particular for $g' = \ell_0^\nu \varphi = \varepsilon \xi$ (44) [d12], with $\varepsilon \in \{\pm 1\}$ [d13] now ξ given by (42) satisfies

$$\xi \rho(\xi) \rho^2(\xi) = 1$$

(N.B. we do not have $\rho^3 = 1$ in $\mathrm{Sl}(2, \widehat{\mathbb{Z}})$, but $\rho^3 = -1$, which implies that the inner automorphism [d14] defined|defines by ρ is of order 3…), hence

$$\varepsilon_0 = \varepsilon,$$

[scan 148]

i.e. the question of the validity of the formula

$$\xi = \ell_0^\nu\varphi$$

in $\mathrm{Sl}(2, \widehat{\mathbb{Z}})$ is equivalent to that of the validity of the formula

$$g\rho(g)\rho^2(g) = 1,$$

which we leave open for the moment. Let us note for reference the following formulas in Gl|Sl$(2, \widehat{\mathbb{Z}})$

$\det \alpha_0 \in \pm 1,\ \det f = 1,$[i1]

$$\text{(Case } h = 1\text{)}$$

$$\begin{cases} \alpha_0, f \in \mathrm{Gl}(2, \widehat{\mathbb{Z}})^{\pm 1} \quad \text{(arbitrary signs, we } \underline{\text{choose}} \text{ them)} \\ \left.\begin{array}{l} \xi \overset{\text{dfn}}{=} \alpha_0 \rho(\alpha_0)^{-1} \\ \varphi \overset{\text{dfn}}{=} f \sigma_\infty(f)^{-1} \end{array}\right| \in \mathrm{Sl}(2, \widehat{\mathbb{Z}}) \\ [g \overset{\text{dfn}}{=} \sigma_\infty(f)^{-1} \ell_1^\nu \rho(f) = (\ell_0^\nu f)^{-1} (\ell_0^\nu \varphi) \rho(\ell_0^\nu f)] \\ \text{hence|therefore} \quad \xi = \cdot \varepsilon \ell_0^\nu \varphi \qquad \varepsilon \in \{\pm 1\} \\ \left[\begin{array}{ll} g \rho(g) \rho^2(g) = \varepsilon.1 & \\ g = \varepsilon.\alpha \rho(\alpha)^{-1} & \alpha = (\ell_0^\nu f)^{-1} \alpha_0 = f^{-1} \ell_0^{-\nu} \alpha_0 \end{array}\right] \end{cases} \tag{45}$$

m826

Marginal note. [m826] It now seems more practical to me to $\underline{\text{define}}$ g by $g = \alpha\rho(\alpha)^{-1}$, so as thus to have $g\rho(g)\rho^2(g) = 1$, and to place the sign $\varepsilon = \varepsilon_2$ in the formula $g = \varepsilon\sigma_\infty(f^{-1})\ell_1^\nu\rho(f)$ — the sign [illeg. 1] does not occur|only occurs [illeg. 3] in $\xi = \varepsilon\ell_0^\nu\varphi$.

N.B. we write [illeg. 1] $\varepsilon = \varepsilon_2$

Symmetrically

$$\text{(Case } g = 1\text{)}$$

$$\begin{cases} \beta_0, f \in \mathrm{Sl}(2, \widehat{\mathbb{Z}}) \quad \text{(modulo signs, we } \underline{\text{choose}} \text{ them)} \\ \eta \overset{\text{dfn}}{=} \beta_0 \sigma_\infty(\beta_0)^{-1} \\ \psi \overset{\text{dfn}}{=} \psi | f \rho(f)^{-1} \\ h \overset{\text{dfn}}{=} f^{-1} \ell_0^\nu \sigma_\infty(\rho(f)) = \end{cases} \tag{46}$$

[scan 149]

[p. 364]

I am going to look at the case $h = 1$ (cf. (45)), setting

$$\begin{cases} \alpha_0 = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \\ f = \begin{pmatrix} r & s \\ t & u \end{pmatrix} \end{cases} \tag{47}$$

m829

Marginal note. m829 change of signs in $\alpha_0, -f|f$ is inessential

m830

Marginal note. m830 N.B. In the "arithmetic" case (i.e. f comes|coming from $\widehat{\Pi}_{0,3}$, α_0 from $\widehat{\widetilde{\Pi}}_{0,3} = \widehat{\Pi}_{0,3}\cdot\{1, \tau_\infty\}$, we will have $\alpha_0, f \equiv 1\ (2)$ i.e. $a, d, r, u \equiv 1\ (2)$, $b, c, s, t \equiv 0\ (2)$

if|where d1 $a, b, c, d, r, s, t, u \in \widehat{\mathbb{Z}}$, with

$$\boxed{ab - cd = \delta \in \{\pm 1\}} \tag{48}$$

$$\boxed{ru - st = 1}. \tag{49}$$

This being set

$$\xi = \alpha_0 \rho (\alpha_0)^{-1} = \begin{pmatrix} A & B \\ C & D \end{pmatrix} \tag{50}$$

$$\varphi = f \underbrace{\sigma_\infty(f)^{-1}}_{{}^t f} = \begin{pmatrix} R & S \\ T & U|u \end{pmatrix} = ? \begin{pmatrix} r^2 + s^2 & rt + su \\ rt + su & t^2 + u^2 \end{pmatrix} \tag{51}$$

so that we will have (cf. § 42, formula (78)

$$\begin{cases} \delta A = (a^2 + b^2 + ab) - (ac + bd + bc) & \delta B = ac + bd + bc \\ \delta C = ac + bd + ad - (c^2 + d^2 + cd) & \delta D = c^2 + d^2 + cd \end{cases}, \tag{52}$$

and (§ 42, (90) and 91)

N.B. we have $\delta = \varepsilon_3$

$$R = r^2 + s^2, \qquad S = T = rt + su, \qquad U = t^2 + u^2. \tag{53}$$

d2 d3We will havei2 the formulas

$$C + D + | - B = 1 \tag{54}$$

$$S = T. \tag{55}$$

The essential relation linking α_0 and f, i.e. linking the "variables" a, b, c, d with u, r, s, t, is the relation

$$\boxed{\xi = \varepsilon \ell_0^\nu \varphi, \qquad \varepsilon \in \{\pm 1\}} \tag{56}$$

which is also written $\ell_0^{-\nu} \xi = \varepsilon \varphi$, i.e.

"loop relation"

Scans 150–168

[scan 150]

$$\begin{pmatrix} A+2\nu C & B+2\nu D \\ C & D \end{pmatrix} = \varepsilon \begin{pmatrix} R & S \\ T(=S) & U \end{pmatrix}. \tag{57}$$

But this condition implies first that the matrix on the left-hand side is symmetric (since $S = T$) i.e.

$$2\nu D = C - B$$

a condition which is also equivalent, by (54), to

$$2\nu D = 1 - D \quad \text{i.e.} \quad \boxed{\mu D = 1} \quad \text{i.e.} \quad D = 1/\mu, \quad \mu = 1/D \tag{58}$$

where $\mu = 2\nu + 1$,[i2] which already implies μ and D invertible.

[d2] Symmetrically, if we write (57) in the form

$$\varepsilon \begin{pmatrix} A & B \\ C & D \end{pmatrix} = \varepsilon \begin{pmatrix} R - 2\nu T & S - 2\nu U \\ T & U \end{pmatrix},$$

the condition $C + D - B = 1$ becomes, for the entries of the matrix φ

$$T + U - (S - 2\nu U) = \varepsilon\ ;$$

i.e.

$$(2\nu + 1)U = \varepsilon \quad \text{i.e.}$$

$$\mu U = \varepsilon \quad \text{i.e.} \quad U = \varepsilon/\mu, \quad \mu = \varepsilon/U \tag{59}$$

which is also equivalent, taking (58) into account, to the relation

$$D = \varepsilon U \quad \text{or} \quad U = \varepsilon D \tag{60}$$

which is none other than the equality of the entries in the bottom rows of the matrices (57). 149

[scan 151]

[p. 365] We can write out the relations (57), as [d1] four relations on the 9 variables $a, b, c, d, r, s, t, u, \mu$ in addition to the relations (48), (49);

$$\begin{cases} \boxed{\begin{aligned} D &= \varepsilon U \\ \mu D &= 1 \\ C &= \varepsilon T \end{aligned}} \quad i.e. \qquad \mu U = \varepsilon \\ A = \varepsilon(R - \underbrace{(\mu-1)}_{2\nu}\underset{\sim}{T}) \end{cases} \tag{61}$$

m835

Marginal note. [m835] N.B. this last one is a consequence of the others, taking $C + D - B = 1$ and $AD - BC = 1$ into account

i.e. – [d5] again[i1]

$$\begin{cases} \boxed{\begin{aligned} \mu(c^2 + d^2 + cd) &= \delta \\ c^2 + d^2 + cd &= \varepsilon\delta(t^2 + u^2) \\ \underline{ac} + \underline{bd} + \underline{ad} - (c^2 + d^2 + cd) &= \delta\varepsilon(rt + su) \end{aligned}} \\ a^2 + b^2 + ab - (ac + bd + bc) = \delta\varepsilon(r^2 + s^2 - (\mu-1)(rt + su)) \end{cases} \tag{62}$$

consequence of the preceding ones

When the signs ε, δ are fixed, we find with (48), (49)[i2] a system of 6 equations in 9 variables $a, b, c, d, r, s, t, u, \mu$ – we should be able to check that the scheme (over $\operatorname{Spec}\mathbb{Z}$) of solutions of these equations is of relative dimension 3, and of relative dimension 1 over the "factors" (a, b, c, d) resp. (r, s, t, u). We thus have an adelic point of this absolute scheme – a point with coefficients in $\widehat{\mathbb{Z}}$…

no, it is of total relative dimension 4

Theorem The multiplier μ is determined as a function of $\xi|\zeta = \begin{pmatrix} A & B \\ C & D \end{pmatrix}$ (considered as an element of $\mathrm{Sl}(2, \widehat{\mathbb{Z}})$), by the relation

$$\mu D = 1 \qquad (58)$$

(+) and it is determined up to sign by $\varphi = \begin{pmatrix} R & S \\ T & U \end{pmatrix}$ by the relation

$$\mu U = \varepsilon \qquad (59) \qquad \text{where } \varepsilon \in \{\pm 1\},$$

and where ε is the sign which occurs in the formulas

$$\begin{cases} \xi|\zeta = \varepsilon l_0^\nu \varphi & (56) \\ g\rho(g)\rho^2(g) = \varepsilon & (45). \\ g = \varepsilon\alpha\rho(\alpha)^{-1} \end{cases}$$

We have $\varepsilon = 1$ iff $\mu \equiv 1$ (4), $\varepsilon = -1$ iff $\mu \equiv -1$ (4). i.e. $\nu \equiv 0$ (2)[i3] i.e. $\nu \equiv 1$ (2)[i4]
m839

Marginal note. m839 in other words, we have $\mu \equiv \varepsilon$ (4) since $U = t^2 + u^2 \equiv 1$ (4) hence $1/U \equiv (1)$ (4) hence $\mu = \varepsilon/U \equiv \varepsilon$ (4). This would be the time to include also the|here the relation $\mu \equiv \delta$ (3) cf. with the appropriate proof…

To prove this, we recall that

$$U = t^2 + u^2$$

note that the only values modulo 4 taken by t^2 and u^2 are 0 and 1, hence those taken by $t^2 + u^2$ are $0, 1$ and 2, and the only unit among these is 1. Thus [d1] $1/\mu$ can be put in the form $\varepsilon(t^2 + u^2)$ modulo 4 iff $1/\mu \equiv \varepsilon$ (4) or again $\mu \equiv \varepsilon$ (4) q.e.d.

[d2] We had seen in a quite analogous way, thanks to the formula $\mu D = 1 \quad (58)$ and

$$D = \delta(c^2 + d^2 + cd)$$

that $\mu \equiv \delta$ (3) i.e. $\delta = +1$ (resp. -1) iff $\mu \equiv 1$ (3) (resp. $\mu \equiv -1$ mod 3). We [d3] shall denote, for all|the prime numbers p, by $\varepsilon_p|\beta_p$ the value at μ of the "quadratic character" relative to p, equal to 1 iff $\mu_p \in (\mathbb{Z}_p^*)^2$. We shall therefore have

$$\begin{cases} \delta = ad - bc = \varepsilon_3|\beta_3(\mu) = \varepsilon_3 \\ \varepsilon = D/U = \varepsilon_2|\beta_2(\mu) = \varepsilon_2, \end{cases} \tag{63}$$

and knowing ε_3 (resp. ε_2, resp. both) is equivalent to knowing μ modulo 3|2 (resp. modulo 4, resp. modulo 12). m840

Marginal note. m840 $(\mathbb{Z}/12\mathbb{Z})^* \simeq (\mathbb{Z}/4\mathbb{Z})^* \times (\mathbb{Z}/3\mathbb{Z})^* \simeq \{\pm 1\} \times \{\pm 1\}$

[scan 153]

[p. 366] We are also going to compute [d1] (cf. formulas (45))

$$\alpha = (l_0^\nu f)^{-1}\alpha_0 = f^{-1}l_0^{-\nu}\alpha_0$$

and

$$g = \varepsilon\alpha\rho(\alpha)^{-1} = \underbrace{\sigma_\infty(f)^{-1}}_{{}^t f}\ l_1^\nu\rho(f) = (l_0^\nu f)^{-1}\xi|\zeta\,\rho(l_0^\nu f).$$

We find

$$\begin{aligned}\alpha &= \underbrace{\begin{pmatrix} u & -s \\ -t & r\end{pmatrix}}_{f^{-1}} \underbrace{\begin{pmatrix}1 & 2\nu \\ 0 & 1\end{pmatrix}\begin{pmatrix}a & b \\ c & d\end{pmatrix}}_{\begin{pmatrix}a+2\nu c & b+2\nu d \\ c & d\end{pmatrix}} \\ &= \begin{pmatrix} u(a+2\nu c) - cs & u(b+2\nu d) - ds \\ -t(a+2\nu c) + cr & -t(b+2\nu d) + dr\end{pmatrix},\end{aligned} \tag{64}$$

m842

Marginal note. [m842] N.B. Unlike α_0 and f, and $\xi|\zeta, \varphi$ which are deduced from them, α [d2] shares with g the advantage and the interest of being determined without ambiguity (up to sign) by an automorphism u of $\widehat{\Pi}_{0,3}$, whereas f etc. are [illeg. 1] choices of ambiguities $f \mapsto l_0^n f$ etc.…

$$\begin{aligned} g &= \underbrace{\begin{pmatrix} r & t \\ s & u\end{pmatrix}}_{\sigma_\infty(f^{-1}) = {}^t f} \underbrace{\begin{pmatrix}1 & 0 \\ 2\nu & 1\end{pmatrix}}_{l_1^\nu | l_0^\nu} \underbrace{\begin{pmatrix} t+u & -t \\ t+u-r-s & r-t\end{pmatrix}}_{\rho(f)\ \text{(cf. §43 formulas (77))}} \\ &= \begin{pmatrix} r & t \\ s & u\end{pmatrix}\begin{pmatrix} t+u & -t \\ \mu(t+u)-r-s & -\mu t + r\end{pmatrix} \\ &= \begin{pmatrix} 1+\mu t(t+u) & -\mu t^2 \\ -1+\mu u(t+u) & 1-\mu u t\end{pmatrix},\end{aligned}$$

i.e.

$$g = \begin{pmatrix} 1+\mu t(t+u) & -\mu t^2 \\ -1+\mu u(t+u) & 1-\mu ut \end{pmatrix}. \tag{65}$$

It appears that g is expressed simply in terms of f i.e. of r, s, t, u directly, and not in terms of α_0 or $\xi|\zeta$ i.e. via the a, b, c, d or A, B, C, D. On the other hand, to express α (64), we must bring in both the[i1] r, s, t, u and the a, b, c, d.

It was natural, in connection with the canonical homomorphism

$$\mathcal{N}_{1,1} \longrightarrow \mathrm{Gl}(2, \widehat{\mathbb{Z}})$$

(cf. §39, (11)) to look for a matrix [d3], which by abuse of language I am going to denote by the same letter, u, as the automorphism under consideration of $\widehat{\Pi}_{0,3}$ with which we had started (just as I denote by the same letter the elements g, f etc. of $\widehat{\Pi}_{0,3}$ or of $\widehat{\mathfrak{S}}_{0,3}|\hat{\mathcal{S}}_{0,3}$, and their images in $\mathrm{Gl}(2, \widehat{\mathbb{Z}})'$, or even corresponding elements in $\mathrm{Gl}(2, \widehat{\mathbb{Z}})$ itself), 152

[scan 154]

$$u \in \mathrm{Gl}(2, \widehat{\mathbb{Z}})$$

[d1] with determinant equal to μ, and inducing on $\mathrm{Sl}(2, \widehat{\mathbb{Z}})'$, by an inner automorphism, the same automorphism as the[i1] u at the outset[i2] (by passage to the quotient), which is made explicit by the formulas

$$\det u = \mu \tag{66}$$

$$u\sigma_\infty u^{-1} = \varepsilon' \sigma_\infty \qquad \varepsilon' \in \{\pm 1\} \tag{67}$$

$$u\rho u^{-1} = \varepsilon'' g\rho \qquad \varepsilon'' \in \{\pm 1\} \tag{68}$$

In fact, [d2] (68) [d3] is written[i3]

$$[u, \rho] = u\rho(u)^{-1} = \varepsilon'' g$$

and applying to both sides the operation $x \mapsto x\rho(x)\rho^2(x)$, and taking into account that $g\rho(g)\rho^2(g) = \varepsilon_2$, [d4] and $x\rho(x)\rho^2(x) = 1$ for $x = u\rho(u)^{-1}$,[i4] we find

$$\varepsilon'' = \varepsilon_2 \tag{68 bis}$$

and (68) is thus equivalent to

$$u\rho(u)^{-1} = \varepsilon_2 g = \alpha\rho(\alpha)^{-1}$$

[d5] i.e. to

$$u = \alpha u_0 \quad \text{with } [u_0, \rho] = 1 \quad (\text{i.e. } u_0\rho(u_0)^{-1} = 1). \tag{69}$$

We have already remarked that (67), (68) determine u only modulo multiplication by a scalar $\lambda \in \widehat{\mathbb{Z}}^*$, and taking (66) into account, u is determined only modulo λ satisfying $\lambda^2 = 1$ i.e. modulo ${}_2\widehat{\mathbb{Z}}^* \simeq \{\pm 1\}^{\mathbb{P}}$ (where $\mathbb{P}$ is the set of prime numbers), but we nevertheless hope to hit upon a canonical choice.

In my first calculations, I hadn't yet brought out|dug up (69), where the condition u_0 commutes with ρ was expressed in the form

$$u_0 = p\,\mathrm{id} + q\rho = \begin{pmatrix} p & q \\ -q & p+q \end{pmatrix} \quad (p, q \in \widehat{\mathbb{Z}}), \tag{70}$$

[p. 367]

so that

$$\det u_0 = p^2 + pq + q^2 \tag{71}$$

and that (66) is written (taking (69) into account, where $\det \alpha = \delta = \varepsilon_3$)

$$p^2 + pq + q^2 = \mu\varepsilon_3 \tag{72}$$

which, in view of the relation

$$c^2 + cd + d^2 = \varepsilon_3/\mu \qquad (52 \text{ and } 58)$$

suggested relations of the form

$$p = \mu c,\ q = \mu d, \quad \text{or} \quad p = \mu d,\ q = \mu c.$$

In fact, expressing (67) as an equation in p, q (added to|: 72), I found (up to sign of course which here is inessential)

$$p = \mu d,\ q = \mu c \qquad \text{i.e.} \qquad u_0 = \mu(c\rho + d) \tag{73}$$

but working in the case $\varepsilon' = +1$ exclusively. (I had thought I could conclude, a little too hastily, that the sign ε' was always $+1$, before realizing that this was hardly compatible with class field theory, and suspecting that we should have $\varepsilon' = +1$ iff $p \equiv 1$ (4).) By making this rather cumbersome detour via the (a, b, c, d), I nevertheless arrived, after many twists and turns (calculation errors etc.) at the formula where there were no longer any a, b, c, d at all, and of a disconcerting simplicity:

$$\underline{\underline{u}} = \mu(t\sigma_\infty + u) = \mu \begin{pmatrix} u & t \\ -t & u \end{pmatrix}, \tag{74}$$

which manifestly corresponds to the case $\varepsilon_2'|\varepsilon' = 1$, i.e. the one where $\underline{u}$ commutes with σ_∞. As (⟺ probably, $\varepsilon_2 = 1$)
m846

Marginal note. m846 I underline the letter u which denotes a matrix, to distinguish it from the u which denotes a scalar.

Apparatus for this scan

140-3-s155-D001 *deletion. Manuscript:* ε
Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 156]

$$\det(t\sigma_\infty + u) = t^2 + u^2 = \varepsilon_2/\mu \quad (= 1/\mu \text{ if } \varepsilon_2 = +1),$$

we shall indeed have, in the case $\varepsilon_2 = 1$, d1

$$\det \underline{u} = \mu^2 \det(t\sigma_\infty + u) = \mu^2\, 1/\mu = \mu$$

i.e., (66). On the other hand, we shall have

$$\begin{aligned}
[u, \rho] &= [t\sigma_\infty + u, \rho] \\
&= \underbrace{\begin{pmatrix} u & t \\ -t & u \end{pmatrix}\begin{pmatrix} 0 & 1 \\ -1 & 1 \end{pmatrix}}_{\begin{pmatrix} -t & u+t \\ -u & u-t \end{pmatrix}} \mu \underbrace{\begin{pmatrix} u & -t \\ t & u \end{pmatrix}\begin{pmatrix} 1 & -1 \\ 1 & 0 \end{pmatrix}}_{\begin{pmatrix} u-t & -u \\ u+t & -t \end{pmatrix}}. \\
&= \mu \begin{pmatrix} (u+t)^2 - ut + t^2 & -t^2 \\ ut - t^2 & u^2 + t^2 - ut \end{pmatrix} = \mu \begin{pmatrix} \frac{1}{\mu} + t(u+t) & -t^2 \\ t(u-t) & \frac{1}{\mu} - ut \end{pmatrix} \\
&= \begin{pmatrix} 1 + \mu t(u+t) & -\mu t^2 \\ \mu t(u-t) & 1 - \mu ut \end{pmatrix},
\end{aligned}$$

m848

Marginal note. m848 We could also apply the formulas §43 (78) —

and comparing with (65) we do indeed find

$$[u, \rho] = g$$

taking into account that

$$\mu(u^2+t^2)=\varepsilon_2=1$$

thus

$$-1+\mu u(t+u)=\underbrace{-1+\mu u^2}_{-\mu t^2}+\mu ut=\mu t(u-t)\ \text{–!!}$$

I would now like, without launching into new calculations, to find "by guesswork" an expression for u, in the [d4] where $\varepsilon_2=-1$, and where we expect to find in (67) the sign $\varepsilon'=-1$ — i.e. that u be an antisimilitude[illeg. 1]

$$\underline{u}\,{}^t\underline{u}=-\det\underline{u}$$

But [d5] the matrix

$$\tau_\infty=\begin{pmatrix}-1&0\\0&1\end{pmatrix}$$

is the typical case of such an antisimilitude, and I expect that the matrix (it is = an orthogonal reflection)

$$\underline{u}=\mu\tau_\infty(t\sigma_\infty+u)=\mu\begin{pmatrix}1|-1&0\\0&-1\end{pmatrix}\begin{pmatrix}u&t\\-t&u\end{pmatrix}=\mu\begin{pmatrix}u|-u&t|-t\\-t&-u\end{pmatrix}$$

[scan 157]

[p. 368]

will do. We shall have, of course

$$\begin{aligned}u\,{}^tu&=\mu^2\begin{pmatrix}u&t\\t&-u\end{pmatrix}\begin{pmatrix}u&t\\t&-u\end{pmatrix}\\&=\mu^2\begin{pmatrix}u^2+t^2&0\\0&u^2+t^2\end{pmatrix}=\mu^2\begin{pmatrix}-1/\mu&0\\0&-1/\mu\end{pmatrix}\end{aligned}$$

i.e.

$$u\,{}^tu=-\mu.\mathrm{Id}$$

and

$$\det u=\mu^2(-u^2-t^2)=\mu^2(1/\mu)=\mu$$

taking into account that now

$$u^2+t^2=\varepsilon_2/\mu=-\frac{1}{\mu}\qquad\text{since }\varepsilon_2=-1.$$

Finally to check (68) let us compute

$$\begin{aligned}[u,\rho]&=\left[\begin{pmatrix}u&t\\t&-u\end{pmatrix},\rho\right]\\&=\underbrace{\begin{pmatrix}u&t\\t&-u\end{pmatrix}\begin{pmatrix}0&1\\-1&1\end{pmatrix}}_{\begin{pmatrix}-t&u+t\\u&-u+t\end{pmatrix}}\frac{1}{\mu}|\mu\underbrace{\begin{pmatrix}-u&-t\\-t&u\end{pmatrix}\begin{pmatrix}1&-1\\1&0\end{pmatrix}}_{\begin{pmatrix}-u-t&u|-u\\u-t&t\end{pmatrix}}\\&=\mu\begin{pmatrix}u(u+t)&t^2\\-(u^2+t^2)-u(u-t)&u^2+t^2-ut\end{pmatrix}=\begin{pmatrix}\mu u(u+t)&\mu t^2\\1-\mu u(u-t)&-1-\mu ut\end{pmatrix}\end{aligned}$$

(taking into account that $\mu(u^2+t^2)=-1$), [d1] do we indeed have

$$[u,\rho]=-g$$

taking into account formula (65) which gives g explicitly in terms of r,s,t,u, we find that this expected|precise formula is equivalent to

$$2\mu ut=0\qquad\text{i.e.}\qquad ut=0$$

really, this is screwy! But I see that if we replace in the definition of u t by $-t$, i.e. if we define

$$\underline{u}=\mu(t\sigma_\infty+u)\tau_\infty=\mu\begin{pmatrix}u&t\\-t&u\end{pmatrix}\begin{pmatrix}1&0\\0&-1\end{pmatrix}=\mu\begin{pmatrix}u&-t\\-t&-u\end{pmatrix}$$

(instead of $\underline{u}=\mu\begin{pmatrix}u&t\\t&-u\end{pmatrix}$), then $\underline{u}$ is always an antisimilitude of determinant μ, and moreover now

$$[u,\rho]=\begin{pmatrix}\mu u(u-t)&\mu t^2\\1-\mu u(u+t)&-1+\mu ut\end{pmatrix}=-g$$

156

Apparatus for this scan

140-3-s157-D001 *deletion. Manuscript:* whence|therefore
Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 158]

which does indeed reduce to checking

$$\mu u(u-t)=-(1+\mu t(t+u))$$

i.e.

$$\mu[u^2-+t^2+]=-1\qquad\text{O.K.}$$

In summary, we find

Theorem Let $\alpha_2\in\mathbb{Z}/2\mathbb{Z}$ be defined by $(-1)^{\alpha_2}=\varepsilon_2$ (thus $\alpha_2\equiv 0\ (2)$ iff $\mu\equiv 1\ (4)$, $\alpha_2\equiv 1\ (2)$ iff $\mu\equiv -1\ (4)$). Put

$$\underline{u}=\mu(t\sigma_\infty+u)\tau_\infty^{\alpha_2}=\mu\begin{pmatrix}u&t\\-t&u\end{pmatrix}\begin{pmatrix}1&0\\0&\varepsilon_2\end{pmatrix}^{\alpha_2},\qquad(75)$$

We then have the formulas

$$\det \underline{u} = \mu \tag{76}$$

$$[\underline{u}, \sigma_\infty] = -|\cdot\varepsilon_2.\mathrm{id} \qquad \text{i.e.} \quad \underline{u}(\sigma_\infty) = \varepsilon_2.\sigma_\infty \tag{77}$$

$$[\underline{u}, \rho] = \varepsilon_2.g \qquad \text{i.e.} \quad \underline{u}(\rho) = (\varepsilon_2 g).\rho \tag{78}$$

Corollary Let u be an automorphism of the group with loops $\widehat{\Pi}_{0,3}$, commuting as outer actions with $\mathfrak{S}_3|\mathcal{S}_3$ (i.e. with σ_∞ and with ρ), μ its multiplier, let us also denote by u the canonical extension of u to $\widehat{\mathfrak{S}}^+_{0,3}|\hat{\mathcal{S}}^+_{0,3} \simeq \mathrm{Sl}(2,\mathbb{Z})^{\wedge\prime}$, inducing the identity on $\mathfrak{S}_3|\mathcal{S}_3 \simeq \widehat{\mathfrak{S}}^+_{0,3}|\hat{\mathcal{S}}^+_{0,3}/\widehat{\Pi}_{0,3}$, and consider the quotient $\mathrm{Sl}(2,\widehat{\mathbb{Z}})'$ of $\mathrm{Sl}(2,\mathbb{Z})^{\wedge\prime}$. Then the action of u passes to an action on the quotient $\mathrm{Sl}(2,\widehat{\mathbb{Z}})'$, and the latter is induced by an [d4]"inner|inner"[i1] automorphism of $\mathrm{Gl}(2,\widehat{\mathbb{Z}})$, defined by a matrix[i2] $\underline{u} \in \mathrm{Gl}(2,\widehat{\mathbb{Z}})$ such that $\det u = \mu$ 157

[scan 159]

[p. 369]

(which describes the outer action of u on $\mathrm{Sl}(2,\widehat{\mathbb{Z}})'$ in terms of the multiplier μ).

m855

Marginal note. [m855] N.B. To check the corollary, we are reduced to the case where u commutes with σ_∞, if necessary conjugating by an inner automorphism of[illeg. 1]…

m856

Marginal note. [m856] We have done this, for the moment, for u commuting with σ_∞.

In fact, we have much better still, since we are going to define canonically modulo sign[i1], in terms of u, the matrix $\underline{u}$ by formula (75), where [d1] $t, u \in \widehat{\mathbb{Z}}$ are defined as follows: [d2] the datum of the automorphism u defines $f \in \widehat{\Pi}_{0,3}$, modulo the operation $f \mapsto \ell_0^n f$ (for $n \in \widehat{\mathbb{Z}}$), and we again denote by f the image of f in $\mathrm{Sl}(2,\widehat{\mathbb{Z}})/\pm 1$, which is thus a matrix $\begin{pmatrix} r & s \\ t & u \end{pmatrix}$, defined modulo

sign, We shall note that in $\mathrm{Sl}(2,\widehat{\mathbb{Z}})$ we have

$$\ell_0^n \begin{pmatrix} r & s \\ t & u \end{pmatrix} = \begin{pmatrix} 1 & -2n \\ 0 & 1 \end{pmatrix} \begin{pmatrix} r & s \\ t & u \end{pmatrix} = \begin{pmatrix} r-2nt & s-2nu \\ t & u \end{pmatrix} \tag{79}$$

($n \in \widehat{\mathbb{Z}}$), so (t,u) does not change (modulo sign) when we replace f by $\ell_0^n f$ — so (t,u) is determined modulo sign by the automorphism u of $\widehat{\Pi}_{0,3}$. [d3] The analogous observation applies moreover to $\alpha_0 = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$, which is determined modulo sign and modulo left multiplication by an ℓ_0^n — the [d4] vector (c,d) is determined modulo sign, hence the element

$$c\rho + d$$

[scan 161]

[p. 370]

$$\begin{aligned}r-\mu tC &\overset{\text{if } \varepsilon_2=1}{=} \underbrace{r-\varepsilon_2\mu rt^2}_{r(1-\varepsilon_2\mu t^2)=\varepsilon_2 r\mu u^2} - \varepsilon_2\mu stu\\ &= \varepsilon_2\mu u(ru-st) = \varepsilon_2\mu u,\end{aligned}$$

thus

$$\mu\alpha(c\rho+d) = \delta\mu\begin{pmatrix}u & \varepsilon_2 t\\ -t & \varepsilon_2 u\end{pmatrix} = \delta\underline{u},$$

i.e.

$$\underline{u} = (\delta\mu)\alpha(c\rho+d) = (\delta\mu)(f^{-1}\ell_0^{-\nu}\alpha_0)(c\rho+d), \tag{82}$$

[d2] where $\delta = ad-bc \in \{\pm 1\}$, $\delta = \varepsilon_3$ (thus $\delta \equiv \mu$ (3))[i2].

Formula which can also be written [d3] with account [d4] taken of (75)

$$\begin{cases} (t\sigma_\infty + u)\tau_\infty^{\alpha_2} = \delta\alpha(c\rho + d) \\ \quad \text{where} \quad \alpha = f^{-1}\ell_0^{-\nu}\alpha_0, \qquad \delta = \varepsilon_3 \in \{\pm 1\}, \quad \delta = ad - bc, \quad \delta \equiv \mu \ (3) \end{cases} \tag{83}$$

or again

$$f(t\sigma_\infty + u)\tau_\infty^{\alpha_2} = \delta\ell_0^{-\nu}\alpha_0(c\rho + d) \tag{84}$$

$$\underbrace{\begin{pmatrix} r & s \\ t & u \end{pmatrix}\begin{pmatrix} u & t \\ -t & u \end{pmatrix}}_{\begin{pmatrix} 1 & rt+su \\ 0 & t^2+u^2 \end{pmatrix}}\begin{pmatrix} 1 & 0 \\ 0 & \varepsilon_2 \end{pmatrix}\begin{pmatrix} 1 & rt+su \\ 0 & t^2+u^2 \end{pmatrix} = \begin{pmatrix} 1 & \varepsilon_2 T \\ 0 & \varepsilon_2 U \end{pmatrix} \qquad \underbrace{\begin{pmatrix} 1 & 2\nu \\ 0 & 1 \end{pmatrix}\begin{pmatrix} a & b \\ c & d \end{pmatrix}\begin{pmatrix} d & c \\ -c & c+d \end{pmatrix}}_{\begin{pmatrix} 1 & C \\ 0 & D \end{pmatrix}} \quad \text{cf. (81)}$$

and in this form the formula was in fact known, as the essential content of the [d11] loop relation in matrix form (56) or (57)

$$: \quad \varepsilon_2 U = D, \qquad \varepsilon_2 T = C \qquad !$$

Remark In fact, under a false appearance of arithmetic, we have done by|for the back door some scales in linear algebra, valid over 160

[scan 162]

arbitrary rings and formulable|formulable probably under much more general and more "comprehensive" conditions — concerning equations of the form

$$[\alpha_0, \rho] = \xi$$

where $\rho \in \mathrm{Gl}(2, A)$ is given, [d1]as well as[i1] ξ, and $\alpha_0 \in \mathrm{Gl}(2, A)$ is the unknown (possibly subject to conditions of the type $\det \alpha_0 = \delta$, δ fixed), as well as simultaneous equations in α_0 and f

$$[\alpha_0, \rho] = \varepsilon.\mathcal{E}_0|\varepsilon_0(\mu - 1)[f, \sigma] \qquad \text{cf. (56)} \qquad (*)$$

where $\rho, \sigma \in \mathrm{Gl}(2, A)$ are given, as well as a scalar $\varepsilon \in A^*$, and $\lambda \longmapsto \mathcal{E}_0|\varepsilon_0(\lambda)$ is a "one-parameter subgroup", for example we can assume

$$\mathcal{E}_0|\varepsilon_0(\lambda) = \begin{pmatrix} 1 & -\lambda \\ 0 & 1 \end{pmatrix} = \varepsilon_0^{\lambda},$$

$$\varepsilon_0 = \begin{pmatrix} 1 & -1 \\ 0 & 1 \end{pmatrix}$$

— assuming if necessary a relation of the form $\sigma\rho = \varepsilon_0$.

Modulo some pleasant adjustments, all the formulas of the present § should be able to be developed in this more general context (as well as substantial complements)[i2] (— but I do not know whether I am going to spell out 161

[p. 380]

here these delightful scales of linear algebra, or even of scheme-theoretic interpretations of the kind that the scheme of solutions of (*) (for f, α_0, μ variable) is a smooth relative[i1] scheme of relative dimension 4, which etc.

I will only spell out, in the present adelic context, manifestly too special, the

Proposition Let $c, d \quad t, u \in \widehat{\mathbb{Z}}$, for them to correspond to data $\alpha_0 = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$, $f = \begin{pmatrix} r & s \\ t & u \end{pmatrix}$ satisfying

$$\underbrace{ad - bc}_{\substack{\text{definition} \\ =\varepsilon_3}} \in \{\pm 1\}, \quad ru - st = 1, \quad \alpha_0 \rho (\alpha_0)^{-1} = \varepsilon_2 \ell_0^{\nu} (f \sigma_\infty (f)^{-1})$$

with $\varepsilon_2 \in \{\pm 1\}$ and $\nu \in \widehat{\mathbb{Z}}$ suitable|suitable (cf. (48) (49) (53)), it f|is necessary and [d3] it suffices that one have

$$c^2 + cd + d^2 = \pm(t^2 + u^2) \quad \in \widehat{\mathbb{Z}}^* \tag{85}$$

Then [d4] $(\varepsilon_2, \varepsilon_3, 2\nu + 1) \in \{\pm 1\} \times \{\pm 1\} \times \widehat{\mathbb{Z}}^*$ is determined[i2] modulo sign (i.e. modulo passing to: $(-\varepsilon_2, -\varepsilon_3, -\nu)$) [d5] by a, b, c, d, by the [d6] relation[i3] (where $\mu = 2\nu + 1$)[i4] [d7]

$$\frac{1}{\mu} = \varepsilon_2 (t^2 + u^2) = \varepsilon_3 (c^2 + cd + u^2) \tag{86}$$

by

[d10] (which determines ε_3, μ when one has chosen ε_2)[i5] and one has

$$\begin{cases} \varepsilon_2 \equiv \mu \quad (4) \\ \varepsilon_3 \equiv \mu \quad (3) \\ \nu = (\mu - 1)/2 \end{cases} \tag{87}$$

[scan 164]

The solutions are then obtained as follows: one chooses $\varepsilon_2, \varepsilon_3, \mu | \mu_2$ as above (two possibilities), d1 and arbitrarily $r, s \in \widehat{\mathbb{Z}}$ satisfying

$$ur - ts = 1$$

(there are always some (for $r^2 + s^2 \in \widehat{\mathbb{Z}}^*$ — hence $\forall p \in \mathbb{P}$, r_p and s_p are not both in $p\mathbb{Z}_p$) and if r_0, s_0 is a solution, the others are obtained in parametric form in λ

$$(r, s) = (r_0, s_0) + | - \lambda(t | u, u | t) = (r_0 + | - \lambda t, s_0 + | - \lambda u). \tag{87}$$

Having chosen r, s hence $f = \begin{pmatrix} r & s \\ t & u \end{pmatrix} \in \mathrm{Sl}(2, \widehat{\mathbb{Z}})$,

d2

Apparatus for this scan

140-3-s164-D001 *deletion. Manuscript:* then
Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

140-3-s164-D002 *deletion. Manuscript:* one deduces from this

$$f \sigma_\infty(f)^{-1} = f^t f = \begin{pmatrix} R & S \\ T & U \end{pmatrix}$$

where $R = r^2 + s^2$, $S = T = rt + su$, $U = t^2 + u^2$, and one successively determines the quantities

$$\begin{cases} D = 1/\mu = \varepsilon_3(c^2 + cd + d^2) = \varepsilon_2 \underset{t^2+}{U} = \varepsilon_2(t^2 + [illeg.\ 1])\varepsilon_2(t^2 + u^2) = \varepsilon_2 U \\ C = \varepsilon_2 T \ (= \varepsilon_2 S) \\ B = C + D - 1 = \varepsilon_2(S + U) - 1 \\ A = \dfrac{1}{D}(1 + BC) = \dfrac{1}{\varepsilon_2 U}(1 + S(S + U) - \varepsilon_2 S) \end{cases} \tag{88}$$

whence a matrix $\begin{pmatrix} A & B \\ C & D \end{pmatrix}$ satisfying $C + D - B = 1$ and $D \in \widehat{\mathbb{Z}}^*$, and satisfying relation (57) t^2+

$$\begin{pmatrix} A + 2\nu C & B + 2\nu D \\ C & D \end{pmatrix} = \varepsilon_2 \begin{pmatrix} R & S \\ T & U \end{pmatrix}$$

which here reduces to the relation in the upper left corner $A + 2\nu C = \varepsilon_2 R$ i.e.

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 165]

[p. 381]

it remains to choose a, b so as to satisfy the two relations $\det \begin{pmatrix} a & b \\ c & d \end{pmatrix} = \varepsilon_3$ and $C = \varepsilon_2 T$ (cf. (61) (62)) i.e.[i1]

$$\begin{cases} d\underline{a} - c\underline{b} = \varepsilon_3 \\ (c+d)\underline{a} + d\underline{b} = \varepsilon_2\varepsilon_3 \underbrace{(\underline{r}t + \underline{s}u)}_{S} + \underbrace{(c^2 + cd + d^2)}_{1/\mu\varepsilon_3} \end{cases} \tag{88}$$

which is a system of two linear equations in $\underline{a}, \underline{b}$, whose determinant is as if by chance $c^2+cd+d^2 = 1/\mu\varepsilon_3 \in \widehat{\mathbb{Z}}^*$ — which ensures a unique solution!

It seems more natural perhaps to start from the multiplier μ, and to look for the systems $\begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} r & s \\ t & u \end{pmatrix}$ corresponding to it, but putting the emphasis on (c, d) (t, u) in the first place. Using μ one determines $\varepsilon_2, \varepsilon_3$ by

$$\mu \equiv \varepsilon_2 \ (2), \qquad \mu \equiv \varepsilon_3 \ (3),$$

[d1] which allows one to [d2] represent $1/\mu$ in the form

$$1/\mu = \varepsilon_2(t^2 + u^2) = \varepsilon_3(c^2 + cd + d^2)$$

(with $t, u, c, d \in \widehat{\mathbb{Z}}$, the systems (t, u) as well as (c, d) "depend on 1 parameter", each[i2] in a very concrete sense that one could probably make precise if one cared to, [d3]with[i3] explicit parameters [d4] σ, τ… Once c, d, t, u have been chosen, one chooses $r, s|t$ as has 164

[scan 166]

been said (with a parameter λ entering[i1] linearly), which then determines r, s uniquely, in a way that involves λ [d1] in a linear-affine way.

In fact, for c, d, t, u and $\varepsilon_2, \varepsilon_3$[i2] fixed, [d2]so as to[i3] satisfy: $\varepsilon_2(t^2+u^2) = \varepsilon_3(c^2+cd+d^2)$, the three equations relating a, b, r, s are linear-affine

$$\begin{cases} d\underline{a} - c\underline{b} = \varepsilon_3 \\ u\underline{r} - t\underline{s} = 1 \\ (c+d)\underline{a} + d\underline{b} - \varepsilon_2\varepsilon_3(u\underline{s} + t\underline{r}) = c^2 + cd + d^2 \end{cases} \tag{89}$$

m867

Marginal note. [m867] we have underlined the "unknown coefficients" $\underline{a}, \underline{b}, \underline{r}, \underline{s}$ to be determined

and the [d3] system is "of rank 3" [d4] — the set of its solutions is an "affine space of dimension 1" over $\widehat{\mathbb{Z}}$...

Remark We have not for the moment taken account of the congruence conditions

$$\begin{pmatrix} a & b \\ c & d \end{pmatrix} \equiv 1 \ (2) \qquad \begin{pmatrix} r & s \\ t & u \end{pmatrix} \equiv 1 \ (2)$$

which express that these matrices arise modulo signs by "reduction" from elements of $\widehat{\widetilde{\Pi}}_{0,3}$, $\widehat{\Pi}_{0,3}$. For the quantities (c, d) [d5] one finds the consequences

$$\begin{cases} d \equiv \pm 1 \ (4) & \text{hence } d^2 \equiv 1 \ (4) \\ c \equiv 0, 2 \ (4) & \text{hence } c^2 \equiv 0 \ (4) \end{cases} \Longrightarrow \begin{aligned} c^2 + d^2 + cd &\equiv 1 + cd \ (4) \\ &\equiv 1 + c \ (4) \end{aligned}$$

hence

$$c^2 + d^2 + cd \equiv 1 + c \ (4) \qquad \text{hence}$$

hence

$$\mu = \varepsilon_3(c^2 + cd + d^2) \equiv \varepsilon_3(1 + c) \ (4)$$

d9

[p. 382]

We thus see that knowledge of c [d1] modulo 4[i1], and that of the sign $ad - bc = \varepsilon_3$, allows one to find the sign ε_2 [d2] by

$$\varepsilon_2 \equiv \varepsilon_3(1 + c) \ (4) \quad \text{i.e.} \quad \varepsilon_2\varepsilon_3 \equiv 1 + c \ (4) \tag{90}$$

If one sets out, for c, d, t, u fixed, satisfying

$$\begin{cases} c \equiv t \equiv 0 \ (2) \qquad d \equiv u \equiv 1 \ (2) \\ (c^2 + cd + d^2) \equiv \ | \ = \varepsilon(t^2 + u^2) \in \widehat{\mathbb{Z}}^* \end{cases} \tag{91}$$

where ε [d5]$\in \{\pm 1\}$[i2] is the sign defined by

$$\varepsilon \equiv 1 + c \ (4)$$

($\varepsilon = 1$ if $c \equiv 0$ (4), $\varepsilon = -1$ if $c \equiv 2$ (4)), to find the corresponding a, b, r, s, satisfying conditions (89), and moreover the congruence conditions

$$b \equiv s \equiv 0 \ (2) \qquad a \equiv r \equiv 1 \ (2), \tag{92}$$

one is led to lift an already given solution modulo 2 of this system of equations to a solution. In terms of the $\widehat{\mathbb{Z}}$-[i3] torsor $\mathcal{T}$ of solutions, this means that one gives oneself an element of the corresponding quotient $\mathbb{Z}/2\mathbb{Z}$-torsor — the set of its liftings is identified with a torsor under $2\widehat{\mathbb{Z}} \simeq \widehat{\mathbb{Z}}$… No mystery! 166

[scan 168]

Remark The additive group $\widehat{\mathbb{Z}}$ operates on the set of solutions $(\alpha_0, f) = \left(\begin{pmatrix} a & b \\ c & d \end{pmatrix}, \begin{pmatrix} r & s \\ t & u \end{pmatrix}\right)$ of the equations under consideration (48)(49)(56)

$$\det \alpha_0 \in \{\pm 1\}, \quad \det f = 1, \quad \alpha_0 \rho(\alpha_0)^{-1} = \varepsilon \ell_0^{\nu}(f \sigma_\infty(f)^{-1}), \quad \varepsilon \in \{\pm 1\}, \tag{93}$$

by

$$\begin{aligned}(\alpha_0, f) &\longmapsto (\alpha_0', f') = (\ell_0^n \alpha_0, \ell_0^n f) \\ &= \left(\begin{pmatrix} a - 2nc & b - 2nd \\ c & d \end{pmatrix}, \begin{pmatrix} r - 2nt & s - 2nu \\ t & u \end{pmatrix}\right)\end{aligned} \tag{93|94}$$

($n \in \widehat{\mathbb{Z}}$). Up to the factor 2 in $2n$, this is precisely the indeterminacy in [d2] the set of solutions of (93)[i1], when c, d, t, u are fixed (cf. (87) and the proposition that goes with it). (the factor 2 is ensured only when one considers|in considering solutions satisfying $\alpha_0' \equiv f_0' \equiv \mathrm{Id}\ (2)$)[i2] One can [d3] say that what is determined intrinsically in $\mathrm{Gl}(2, \widehat{\mathbb{Z}})^{\pm 1\prime}|\mathrm{Gl}(2, \widehat{\mathbb{Z}})^{\pm 1}$[i3] in terms of the loop[i4] automorphism $\underline{u}$ of $\widehat{\Pi}_{0,3}$ commuting with σ_∞, is neither more nor less than [d4]

$$\text{a)} \quad \text{the multiplier } \mu \in \widehat{\mathbb{Z}}^* \tag{95}$$

[d5] (hence|whence $\varepsilon_2 = \varepsilon_2|\xi_2(\mu), \ \varepsilon_3 = \varepsilon_3|\xi_3(\mu)$)[i5]
b) the quantities [d6] the $c, d, t, u \in \widehat{\mathbb{Z}}$ satisfying the everlasting relation (86)

$$\varepsilon_2(t^2 + u^2) = \varepsilon_2(c^2 + cd + d^2) = 1/\mu \tag{96}$$

and the congruence relations

$$c \equiv t \equiv 0\ (2) \qquad d \equiv u \equiv 1\ (2) \tag{97}$$

It is true that we have seen that there is a natural[i6] way in $\widehat{\Pi}_{0,3}$ to normalize the choice of the f, so as to remove the ambiguity|ambiguity of the $\ell_0^n f$ (cf. § 41 (24bis)[i7] where this was touched upon — I will come back to it again later…) but it seems to me not very[i8] interesting 167

Scans 169–187

[scan 169]

[p. 383]

for the moment to ignore this possibility of normalization – which brings out more clearly, indeed, the crucial character, in all these l-adic calculations, of the role played by the four quantities $c, d, t, u \in \widehat{\mathbb{Z}}$.

[scan 170]

[p. 384]

45 The homomorphism $\widetilde{M}_{0,3} \longrightarrow \mathrm{Gl}(2, \widehat{\mathbb{Z}})'$, construction of the extension [d1] $\widetilde{N}_{1,1}$ of $\tilde{\Gamma}$ by $\mathrm{Sl}(2, \mathbb{Z})^\wedge$.

We denote by $\widetilde{M}_{0,3}$ the group of [d2] loop automorphisms of $\widehat{\mathcal{G}}^+_{0,3}$ which [d3] induce[i1] up to conjugacy [d4] on the quotient $\mathfrak{S}_3|\mathcal{G}_3 \simeq \widehat{\mathcal{G}}^+_{0,3}/\widehat{\Pi}_{0,3}$ the trivial action – we have[i2] thus a structure of an[i3] extension

$$(1) \qquad 1 \longrightarrow \widehat{\mathcal{G}}^+_{0,3} \longrightarrow \widetilde{M}_{0,3} \longrightarrow \widetilde{N}_{0,3} \longrightarrow 1,$$

m871

Marginal note. [m871] (We shall denote by $\widetilde{M}^!_{0,3}$ the subgroup consisting of the automorphisms which induce strict[ly] the ident[ity] in $\mathfrak{S}_3|\mathcal{G}_3$ – it corresponds to $\widetilde{N}^!_{0,3}$ – automorphisms that are outer loop automorphisms fixing the loop classes (and †[d5]|induce the identity on $\mathfrak{S}_3|\mathcal{G}_3$ up to conjug[acy]))

$\widetilde{N}_{0,3}$ denotes the group of outer automorphisms of $\widehat{\mathcal{G}}^+_{0,3}$ which [d6] induce the identity in[i4] $\mathfrak{S}_3|\mathcal{G}_3$. We note that

$$\Gamma = \Gamma_{\mathbb{Q}} \hookrightarrow \tilde{\Gamma},$$

and that the inverse image of $\Gamma_{\mathbb{Q}}$ in the extension (1) is none other than $M_{0,3}$ – but for the moment I have no very plausible characterization to propose of $\Gamma_{\mathbb{Q}}$ as a subgroup of $\tilde{\Gamma}$. We have a canonical splitting of the extension (1), via the subgroup $\tilde{\Gamma}_\sigma$ of M consisting of the automorphisms $u \in \widetilde{M}_{0,3}$ which commute with σ_∞,

[scan 172]

[p. 385]

Theorem The map φ' is a group homomorphism.

This means, taking into account that φ_0 is already a group homomorphism, the theorem means that

a) φ'_σ is a group homomorphism, i.e.

$$(8) \qquad \varphi'_\sigma(\underline{u}'\underline{u}) = \varphi'_\sigma(\underline{u}')\,\varphi'_\sigma(\underline{u}) \qquad (\underline{u}, \underline{u}' \in \tilde{\Gamma}_\sigma)$$

b) we have, for $a \in \mathcal{G}^+_{0,3} | \widehat{\mathcal{G}}^+_{0,3}$, $\underline{u} \in \tilde{\Gamma}_\sigma$

$$(9) \qquad \varphi'_0(\underbrace{\underline{u}a\underline{u}^{-1}}_{\underline{u}(a)}) = \varphi'_\sigma(\underline{u})\varphi'_0(a)\varphi'_\sigma(\underline{u})^{-1}.$$

d2 But the i1 formula (9) is a fact already established, i2 d3 since the d4 very construction of the matrix $\varphi'_\sigma(\underline{u}) = \mu(t\sigma_\infty + u)\tau^{\varepsilon}_\infty$ in the preceding paragraphs was made in a way d5 such that this formula should be verified (cf. (67)(68), and the corollary to theorem (77)…). To verify (8), d6 we shall i3 first make explicit the quantities g, h, f for a product of two operators $u', u''|u', u \in \widetilde{M}_{0,3}$, in terms of their values for u', u themselves. An immediate calculation gives, in this sense, some "cocycle relations"

$$(10) \qquad \begin{cases} g(\underline{u}'\underline{u}) = \underline{u}'(g(\underline{u})).g(\underline{u}') \\ h(\underline{u}'\underline{u}) = \underline{u}'(h(\underline{u})).h(\underline{u}') \\ f(\underline{u}'\underline{u}) = f(\underline{u}').\underline{u}'(f(\underline{u})) \end{cases}$$

Remarks 1)[i1] We shall moreover have likewise, with the notations of the § above

$$(11) \qquad \begin{cases} \alpha(u'u) = u'(\alpha(u)).\alpha(u') \\ \beta(u'u) = u'(\beta(u)).\beta(u') \end{cases}$$

[d1] 2) The formulas (10) are a little more friendly|friendly for f, than for g and h, α and β[i2] (– one would feel like changing notation yet again, and also replacing g and h by g^{-1}, h^{-1} (as previously a g_0 had become f^{-1}…).

Let us again denote by the same letters $g(u), h(u)$ etc. the images of these quantities in $\mathrm{Sl}(2,\widehat{\mathbb{Z}})'$, [d2] the analogous formulas in $\mathrm{Sl}(2,\widehat{\mathbb{Z}})'$ (or $(\mathrm{Gl}(2,\widehat{\mathbb{Z}})^{\pm 1})'$ for [d3] the α of (11)) which are written

$$(12) \qquad \begin{cases} g(\underline{u}'\underline{u}) = \mathrm{int}(\varphi'_\sigma(\underline{u}'))(g(\underline{u})).g(\underline{u}') \\ h(\underline{u}'\underline{u}) = \mathrm{int}(\varphi'_\sigma(\underline{u}'))(h(\underline{u})).h(\underline{u}') \\ f(\underline{u}'\underline{u}) = f(\underline{u}').(\mathrm{int}(\varphi_\sigma(\underline{u}'))(f(\underline{u}))) \\ \alpha(\underline{u}'\underline{u}) = \mathrm{int}\,\varphi'_\sigma(\underline{u}')(\alpha(\underline{u})).\alpha(\underline{u}') \\ \beta(\underline{u}'\underline{u}) = \mathrm{int}\,\varphi'_\sigma(\underline{u}')(\beta(\underline{u})).\beta(\underline{u}') \end{cases}$$

in $\mathrm{Gl}(2,\widehat{\mathbb{Z}})'$.

[d5]These formulas[i8] in $\mathrm{Gl}(2,\widehat{\mathbb{Z}})'$ do indeed have an entirely explicit character from the point of view of effective computation, unlike

Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

[scan 174]

[p. 386]

the case of the initial formulas in $\widehat{\Pi}_{0,3}$ or $\widehat{\widehat{\Pi}}_{0,3}$, where quantities like $\underline{u}'(\underbrace{g(\underline{u})}_{g})$ cannot be made explicit [d1] by simple algebraic formulas in terms of the data g, h, f,[i1] g', h', f' [d2] $= g(\underline{u})$ etc. which determine $\underline{u}$ and $\underline{u}'$.

These formulas are supplemented, for the record, by

$$\mu(\underline{u}'\underline{u}) = \mu(\underline{u}')\mu(\underline{u}) \tag{13}$$

implying in particular

$$\varepsilon_2(\underline{u}'\underline{u}) = \varepsilon_2(\underline{u}')\varepsilon_2(\underline{u}). \tag{14}$$

To carry out the calculation of $\varphi_\sigma(\underline{u}' \,.\, \underline{u})$ and verify that it is equal to $\varphi_\sigma(\underline{u}')\varphi_\sigma(\underline{u})$, we [d3] shall introduce the coefficients r, s, t, u of $f = f(\underline{u})$, r', s', t', u' of $f' =$[i2] $f(\underline{u}')$, and r'', s'', t'', u'' of $f'' = f(\underline{u}'\underline{u})$, likewise μ, μ', μ'',[i3] $\varepsilon, \varepsilon', \varepsilon''$, whence

$$\mu'' = \mu\mu', \quad \varepsilon'' = \varepsilon\varepsilon' \tag{15}$$

and the formula in f in (12) is therefore written

$$f'' = f'\underline{u}'f\underline{u}'^{-1} \tag{16}$$

where we have written, as in the § above, $\underline{u}'$ instead of $\varphi_\sigma(\underline{u}')$, [d5] In explicit terms

$$\begin{pmatrix} r'' & s'' \\ t'' & u'' \end{pmatrix} = \begin{pmatrix} r' & s' \\ t' & u' \end{pmatrix} \mu' \begin{pmatrix} u' & \varepsilon' t' \\ -t' & \varepsilon' u' \end{pmatrix} \begin{pmatrix} r & s \\ t & u \end{pmatrix} \dagger \left|\frac{\mu'}{\mu'}\right. \begin{pmatrix} \varepsilon' u' & -\varepsilon' t' \\ t' & u' \end{pmatrix}$$

[scan 175]

The product of the last three terms on the right-hand side is not encouraging:

$$\underline{u}'\, f \underline{u}'^{-1} = \mu' \begin{pmatrix} \varepsilon' r u'^2 + s t' u' + t t' u' + \varepsilon' u t'^2 & -\varepsilon' r t' u' + s u'^2 - t t'^2 + \varepsilon' u u' t' \\ -\varepsilon' r u' t' - s t'^2 + t u'^2 + \varepsilon' u u' t' & -\varepsilon' r t'^2 - s u' t' - t u' t' + \varepsilon' u u'^2 \end{pmatrix},$$

but the product with f' simplifies miraculously, thanks to the relation

$$t'^2 + u'^2 = \varepsilon'/\mu'$$

and we find

$$f'' = \begin{pmatrix} r'' & s'' \\ t'' & u'' \end{pmatrix} = \begin{pmatrix} \varepsilon | * \text{ mess} & \text{mess} \\ \varepsilon' t u' + u t' & -\varepsilon' t t' + u u' \end{pmatrix}$$

whence

$$t'' = \frac{1}{\mu'}(\varepsilon' t u' + u t') \qquad u'' = \frac{1}{\mu'}(-t t' + u u') \tag{18}$$

and hence (taking account of $\mu'' = \mu\mu'$,[i1] $\varepsilon'' = \varepsilon\varepsilon'$)

$$\underline{u}'' = \mu\mu' \begin{pmatrix} -\varepsilon' t t' + u u' & \varepsilon t u' + \varepsilon\varepsilon' u t' \\ -\varepsilon' t u' - u t' & -\varepsilon\varepsilon' t t' + \varepsilon\varepsilon' u u' \end{pmatrix}$$

and the formula to be checked u,

$$\underline{u}'' = \underline{u}'\underline{u}$$

reduces to

$$\mu\mu' \begin{pmatrix} -t t' + u u' & \varepsilon t u' + \varepsilon\varepsilon' u t' \\ -\varepsilon' t u' - u t' & -\varepsilon t t' + \varepsilon\varepsilon' u u' \end{pmatrix} = \mu' \begin{pmatrix} u' & \varepsilon' t' \\ -t' & \varepsilon' u' \end{pmatrix} \mu \begin{pmatrix} u & \varepsilon t \\ -t & \varepsilon u \end{pmatrix}$$

which is indeed true, OK !.

Here again, one feels that these calculations ought to fit into a carpet of linear algebra that I am too lazy to unroll in extenso. One would have to paraphrase the group Or rather[i2] $\widetilde{M}_{0,3}$ – described by these systems (g, h, f) – in terms (α, β, f)[i3] of the reductions of g, h, f

[scan 176]

[p. 387]

in $\mathrm{Gl}(2, \widehat{\mathbb{Z}})^{\pm 1\prime}_{\mathfrak{g}}$, then replacing $\widehat{\mathbb{Z}}$ by an arbitrary ring, and of course $\mathrm{Gl}(2, \widehat{\mathbb{Z}})'$ by $\mathrm{Gl}(2, A|\widehat{\mathbb{Z}})$ itself. Perhaps I will come back to this eventually....

Having thus constructed

$$\varphi : \widetilde{M}_{0,3} \longrightarrow \mathrm{Gl}(2, \widehat{\mathbb{Z}})' = \mathrm{Gl}(2, \widehat{\mathbb{Z}})/\pm 1$$

we deduce from it, by inverse image of the central[i1] extension $\mathrm{Gl}(2, \widehat{\mathbb{Z}})$ of $\mathrm{Gl}(2, \widehat{\mathbb{Z}})'$ by [d1] $\{\pm 1\}$, a central extension of $\widetilde{M}_{0,3}$ by $\{\pm 1\}$, which I denote by $\widetilde{N}_{1,1}$, and we have a homomorphism of extensions

$$\begin{array}{ccccccccc} 1 & \longrightarrow & \{\pm 1\} & \longrightarrow & \widetilde{N}_{1,1} & \longrightarrow & \widetilde{M}_{0,3} & \longrightarrow & 1 \\ & & \| & & \downarrow{\scriptstyle \varphi} & & \downarrow{\scriptstyle \varphi'} & & \\ 1 & \longrightarrow & \{\pm 1\} & \longrightarrow & \mathrm{Gl}(2, \widehat{\mathbb{Z}}) & \longrightarrow & \mathrm{Gl}(2, \widehat{\mathbb{Z}})' & \longrightarrow & 1 \end{array} \tag{19}$$

One should check that the homomorphism φ' we have just constructed coincides on $M_{0,3} \subset \widetilde{M}_{0,3}$ with the well-known "modular" homomorphism of § 39 (1) – it suffices to check it on the subgroup $\Gamma_{\mathbb{Q},\sigma}$ of $\tilde{\Gamma}_{\sigma}$ corresponding to $\Gamma_{\mathbb{Q}}$ – this should not be very difficult, and I will assume it here. This [d1] assumed, we find that the inverse image of $M_{0,3}$ in [d2] $\widetilde{N}_{1,1}$ is none other (up to canonical isomorphism) than $N_{1,1}$ itself – in any case the inverse image of $\widehat{\mathcal{G}}^{+}_{0,3}$ [d3] is none other than $\widehat{\mathcal{T}}^{+}_{1,1} \simeq \mathrm{Sl}(2,\mathbb{Z})^{\wedge}$[i1]. We will then have (with this identification)

$$\begin{array}{ccccccccc} 1 & \longrightarrow & \widehat{\mathcal{T}}^{+}_{1,1} \\ & & \| \ \mathrm{Sl}(2,\mathbb{Z})^{\wedge} & \longrightarrow & \widetilde{N}_{1,1} & \longrightarrow & \tilde{\Gamma} & \longrightarrow & 1 \\ & & \downarrow & & \downarrow{\scriptstyle \varphi} & & \downarrow{\scriptstyle \chi} & & \\ 1 & \longrightarrow & \mathrm{Sl}(2,\widehat{\mathbb{Z}}) & \longrightarrow & \mathrm{Gl}(2,\widehat{\mathbb{Z}}) & \xrightarrow{\det} & \widehat{\mathbb{Z}}^{*} & \longrightarrow & 1 \end{array} \tag{20}$$

[scan 178]

[p. 388]

so we have reconstructed|reconstructed in terms of loop automorphisms of $\widehat{\Pi}_{0,3}$ the diagram (1) of § 39, or rather a diagram a larger, into which that of § 39 embeds – it would still remain to characterize $\Gamma_{\mathbb{Q}}$ as a subgroup of $\tilde{\Gamma}$.

The diagram deduced directly from the preceding theorem

$$\begin{array}{ccccccccc} 1 & \longrightarrow & \widehat{\mathcal{G}}^{+}_{0,3} & \longrightarrow & \widetilde{M}_{0,3} & \longrightarrow & \tilde{\Gamma} & \longrightarrow & 1 \\ & & \downarrow & & \downarrow{\scriptstyle \varphi'} & & \downarrow{\scriptstyle \chi} & & \\ 1 & \longrightarrow & \mathrm{Sl}(2,\widehat{\mathbb{Z}})' & \longrightarrow & \mathrm{Gl}(2,\widehat{\mathbb{Z}})' & \xrightarrow[\det]{} & \widehat{\mathbb{Z}}^{*} & \longrightarrow & 1 \end{array} \tag{21}$$

can be regarded as being deduced from the preceding one by reduction modulo the [d1] central subgroups[i1] $\{\pm 1\}$ in the two rows.

What becomes in (20) of the splitting (3) of $\widetilde{M}_{0,3}$? Is there a privileged way, for every element of $\widetilde{N}_{1,1}$ – i.e. a pair of a $u = (g, h, f) \in \widetilde{M}_{0,3}$, and a $\underline{u}_0 \in \mathrm{Gl}(2, \widehat{\mathbb{Z}})$

which lifts the element $\underline{u} = \varphi'_{\sigma}(u)$ of $\mathrm{Gl}(2, \widehat{\mathbb{Z}})'$, to "normalize" it modulo [d1] composition with an element of $\mathrm{Sl}(2, \mathbb{Z})^{\wedge}$, so that it has [d2] (say) a commutation property with σ_{∞}, of the type $u(\sigma_{\infty}) = \sigma_{\infty}$, [d4] $u_0|u(\sigma_{\infty}) = \pm\sigma_{\infty}$?

Another way of posing the question, in terms of the subgroup $\tilde{\Gamma}_{\sigma} \subset \widetilde{M}_{0,3}$, is the following: is there a canonical lifting $\tilde{\Gamma}_{\sigma} \longrightarrow \widetilde{N}_{1,1}$, thus assigning to every $\underline{u} = (g, f) \in \tilde{\Gamma}_{\sigma}$ (That is a $\underline{u} = \mu(t\sigma_{\infty} + u)\tau_{\infty}^{\alpha} \in \mathrm{Gl}(2, \widehat{\mathbb{Z}})',|\}$ [d5] i.e. a $\underline{u}$ defined modulo sign) a representative $\underline{u}_0 \in \mathrm{Gl}(2, \widehat{\mathbb{Z}})$ – i.e. a way of removing this ambiguity of sign? In fact, if we replace $\tilde{\Gamma}_{\sigma}$ by $\Gamma_{\mathbb{Q},\sigma}$, the Standard [d6]yogas[i1] suggest that the liftings in

[p. 389]

question should|must correspond to elliptic curves over $\mathbb{Q}$, equipped with a Jacobi rigidification of level 2, corresponding (under the isomorphism $\mathcal{M}'_{1,1\,\mathbb{Q}} \simeq U_{0,3\,\mathbb{Q}}$) to the point 1/2 of $U_{0,3}(\mathbb{Q})$. The indeterminacy in the choice of such an elliptic curve is precisely in $H^1(\mathbb{Q}, \{\pm 1\})$ (it is a datum of a quadratic extension of|to $\mathbb{Q}$) which is identified with $\mathrm{Hom}(\Gamma_{\mathbb{Q}}, \{\pm 1\})$ – so this is indeed also the indeterminacy for a lifting. This proves essentially that the idea suggested by the general yoga is indeed correct|correct – and this shows at the same time that there is no (even on $\Gamma_{\mathbb{Q},\sigma}$) really privileged choice. That there are such liftings (on $\Gamma_{\mathbb{Q},\sigma}$)[i1] comes from the fact that there are indeed elliptic

[p. 390]

46 Definitive notations (?) – new recapitulation

(for the loop automorphisms of $\widehat{\Pi}_{0,3}$ and of $\widehat{\mathcal{G}}^{+}_{0,3} \simeq \mathrm{Sl}(2,\mathbb{Z})'^{\wedge}$).

Ⓘ The groups $\widetilde{M}_{0,3}$ and $\widetilde{N}^{!}_{0,3}$.

We set

(1) $\widetilde{M}_{0,3}$ = group of automorphisms of $\widehat{\mathcal{G}}^{+}_{0,3} \simeq \mathrm{Sl}(2,\mathbb{Z})^{\wedge\prime}$ which leave $\widehat{\Pi}_{0,3}$ invariant, and which respect the "loop structure" i.e. satisfy $u(\varepsilon_i|\varepsilon_0) = \mathrm{int}(f^{-1})(\varepsilon_i^{\mu})$, with $f \in \widehat{\mathcal{G}}^{+}_{0,3}$, $i \in \{0,1,\infty\}$, $\mu \in \widehat{\mathbb{Z}}^*$ (OBSERVATION $f \in \widehat{\Pi}_{0,3}$, and $f|f_0$ is then determined in $L_0\backslash\widehat{\Pi}_{0,3}$)

$\overset{\text{restr.}}{\underset{\sim}{\longrightarrow}}$ group of [d1] loop automorphisms of $\widehat{\Pi}_{0,3}$ which commute as outer actions with the natural outer action of $\mathfrak{S}_3|\mathcal{G}_3$.

m873

Marginal note. [m873] N.B. $\widetilde{M}_{0,3}$ is also the normalizer of $\widehat{\mathcal{G}}^{+}_{0,3}$ in $\widehat{\widehat{\mathcal{G}}}_{0,3}$, and likewise $\widetilde{N}_{0,3}$ the normalizer|normalizer of $\widehat{\mathcal{T}}_{0,3} = \mathcal{T}_{0,3}$ in $\widehat{\widehat{\mathcal{T}}}_{0,3}$

We have an extension structure

$$(2) \qquad 1 \longrightarrow \widehat{\Pi}_{0,3} \longrightarrow \widetilde{M}_{0,3} \longrightarrow \widetilde{N}_{0,3} \longrightarrow 1,$$

where [d2]

$$(3) \qquad \widetilde{N}_{0,3} \overset{\text{dfn}}{=} \widetilde{M}_{0,3}/\widehat{\Pi}_{0,3}$$

$\simeq$ group of outer loop automorphisms of $\widehat{\Pi}_{0,3}$, commuting with $\mathfrak{S}_3|\mathcal{G}_3$.

The natural homomorphism: $\mathfrak{S}_3|\mathcal{G}_3 \longrightarrow \mathrm{Aut}(\mathfrak{S}_3|\mathcal{G}_3)$ is an isomorphism

$$(4) \qquad \mathfrak{S}_3|\mathcal{G}_3 \overset{x\mapsto \mathrm{int}(x)}{\underset{\sim}{\longrightarrow}} \mathrm{Aut}(\mathfrak{S}_3|\mathcal{G}_3),$$

and the natural homomorphism

$$\widetilde{M}_{0,3} \longrightarrow \mathrm{Aut}(\mathfrak{S}_3|\mathcal{G}_3 = \widehat{\mathcal{G}}^{+}_{0,3}/\widehat{\Pi}_{0,3})$$

then defines a homomorphism

$$(5) \qquad \widetilde{M}_{0,3} \longrightarrow \mathfrak{S}_3|\mathcal{G}_3$$

which can also be interpreted as the composite

$$(6) \qquad \widetilde{M}_{0,3} \hookrightarrow \underset{\substack{\text{all the loop automorphisms}\\ \text{of } \widehat{\Pi}_{0,3}}}{\widehat{\widehat{\mathcal{G}}}_{0,3}} \xrightarrow{\substack{\text{action on the}\\ \text{loop classes}}} \mathfrak{S}_3|\mathcal{G}_3,$$

[scan 183]

and which is trivial on $\widehat{\Pi}_{0,3}$, hence factors as

$$(7) \qquad \widetilde{N}_{0,3} \longrightarrow \mathfrak{S}_3|\mathcal{G}_3.$$

The kernels of (5), (7), are denoted $\widetilde{M}^{!}_{0,3}$, $\widetilde{N}^{!}_{0,3}$ respectively, so that we have a diagram of exact sequences

$$\begin{array}{lccccccccc}
 & & & & & & 1 & & & \\
 & & & & & & \downarrow & & & \\
 & & & & & & \Pi_{0,3} & & & \\
 & & & & & & \downarrow & & & \\
(8) & & 1 & \longrightarrow & \widetilde{M}^{!}_{0,3} & \longrightarrow & \widetilde{M}_{0,3} & \longrightarrow & \mathfrak{S}_3|\mathcal{G}_3 & \longrightarrow & 1 \\
 & & & & \downarrow & & \downarrow & & \| & & \\
(9) & & 1 & \longrightarrow & \widetilde{N}^{!}_{0,3} & \longrightarrow & \widetilde{N}_{0,3} & \longrightarrow & \mathfrak{S}_3|\mathcal{G}_3 & \longrightarrow & 1, \\
 & & & & \downarrow & & & & & & \\
 & & & & 1 & & & & & &
\end{array}$$

(9) being interpretable as the quotient of (8) by $\widehat{\Pi}_{0,3}$.
Let us note also the corresponding extension structure

$$(9\text{bis}) \qquad 1 \longrightarrow \widehat{\Pi}_{0,3} \longrightarrow \widetilde{M}^{!}_{0,3} \longrightarrow \widetilde{N}^{!}_{0,3} \longrightarrow 1$$

i4

We also have a canonical homomorphism

$$(10) \qquad \mathfrak{S}_3|\mathcal{G}_3 \simeq \widehat{\mathcal{G}}^{+}_{0,3}/\widehat{\Pi}_{0,3} \hookrightarrow \widetilde{N}_{0,3},$$

whose composite with 7 is the identity, whence a canonical isomorphism

$$(11) \qquad \widetilde{N}_{0,3} \simeq \mathfrak{S}_3|\mathcal{G}_3 \times \widetilde{N}^{!}_{0,3}$$

On the other hand, we also have an inclusion

$$(12) \qquad \begin{array}{ccc} \mathcal{T}_{0,3} & & \hookrightarrow \widetilde{N}_{0,3} \\ \wr|\simeq & & \\ \mathfrak{S}_3|\mathcal{G}_3 \times \mathbb{Z}/2\mathbb{Z} & & \end{array}$$

which on the factor $\mathfrak{S}_3|\mathcal{G}_3 = \mathcal{T}^{+}_{0,3}$ coincides with (10), and which [d1] maps the nontrivial element τ of $\mathbb{Z}/2\mathbb{Z} = \mathcal{T}^{!}_{0,3}$ to the element, also denoted τ, of the second factor $\widetilde{N}^{!}_{0,3}$ of (11).

[p. 392]

II Computational determination of the elements of $\widetilde{N}^!_{0,3}$.

1) Determination by h, g, f.

d1

Recall that

(21) $\widetilde{N}^!_{0,3}|\widetilde{M}^!_{0,3}$ = automorphisms of $\widehat{\mathcal{G}}^+_{0,3} \simeq \mathrm{Sl}(2,\mathbb{Z})^{\wedge\prime}|\widehat{\mathrm{Sl}(2,\mathbb{Z})}'$ that stabilize $\widehat{\Pi}_{0,3}$, induce the identity on $\mathfrak{S}_3|\mathcal{G}_3 = \widehat{\mathcal{G}}^+_{0,3}/\widehat{\Pi}_{0,3}$, and preserve the loop structure (defined by the class of ε_0)

A $u \in \widetilde{M}^!_{0,3}$ is determined by a system

$$(22) \qquad (h, g, f) \qquad\qquad (h, g, f \in \widehat{\Pi}_{0,3})$$

d3via i1 the formulas

$$(23) \qquad \begin{cases} u(\sigma_\infty) = h\sigma_\infty \\ u(\rho) = g\rho \end{cases}$$

f determined modulo $f \mapsto \ell_0^n f$, $n \in \widehat{\mathbb{Z}}$

d4

the condition that these formulas define an automorphism (or at least an endomorphism) of $\widehat{\mathcal{G}}^+_{0,3}$ (which will necessarily induce the identity on $\mathfrak{S}_3|\mathcal{G}_3$) is expressed by the formulas

$$(24) \qquad (h\sigma_\infty)^2 = (g\rho)^3 = 1,$$

which can also be written

$$(25) \qquad \boxed{\begin{cases} h\sigma_\infty(h) = 1 \\ g\rho(g)\rho^2(g) = 1 \end{cases}},$$

and the condition that u preserves the loop structure is expressed by

$$(26) \qquad u(\varepsilon_0) = \mathrm{int}(f^{-1})(\varepsilon_0^\mu) \qquad \mu \in \widehat{\mathbb{Z}}^* \text{ suitable},$$

equivalent|equivalent to the condition

loop relation in $\widehat{\mathcal{G}}^+_{0,3}$ (raw form)

loop relation in $\widehat{\Pi}_{0,3}$ (raw form)

$$(27) \qquad u(\ell_0) = \mathrm{int}(f^{-1})(\ell_0^\mu),$$

it is easily made explicit in terms of h, g, f (preferably in form (26)) taking into account that $\varepsilon_0 = \sigma_\infty \rho$

$$\underbrace{(h\sigma_\infty)(g\rho)}_{h\sigma_\infty(g)\,\underbrace{\sigma_\infty\rho}_{\varepsilon_0}} = \underbrace{\mathrm{int}(f^{-1})\varepsilon_0^\mu}_{f^{-1}\varepsilon_0^\mu f}, \quad \text{i.e}$$

$$fh\sigma_\infty(g) \qquad \underbrace{\varepsilon_0 f^{-1}}_{\varepsilon_0(f^{-1})\varepsilon_0 = \sigma_\infty(\rho(f)^{-1})\varepsilon_0} \qquad = \varepsilon_0^\mu \qquad \text{i.e.}$$

$$fh\sigma_\infty(g\rho(f)^{-1}) = \varepsilon_0^{\mu-1} \qquad \text{i.e., setting}$$

$$(28) \qquad \nu \overset{\text{dfn}}{=} \frac{\mu - 1}{2} \in \widehat{\mathbb{Z}}$$

the relation (taking into account that $\varepsilon_0^2 = \ell_0$)

possible, since $\mu \in \widehat{\mathbb{Z}}^*$ hence $\mu \equiv 1\ (2)$

$$fh\sigma_\infty(g\rho(f)^{-1}) = \ell_0^\nu,$$

or again, applying σ_∞, since $\sigma_\infty(\ell_0) = \ell_1$

$$\sigma_\infty(f)\sigma_\infty(h)g\rho(f)^{-1} = \ell_1^\nu$$

that is, finally

$$(29) \qquad \boxed{\sigma_\infty(h)g = \sigma_\infty(f)^{-1}\ell_1^\nu\rho(f)}$$

(loop relation in h, g, f).
m879

Marginal note. m879 N.B. $\nu \in \widehat{\mathbb{Z}}^{\mathrm{i}1}$ is uniquely determined by g, h, and we have also $2\nu + 1 \in \widehat{\mathbb{Z}}^*$ $2\nu + 1$ is the multiplier…

N.B. One must in addition require, for h, g, f to really define an automorphism, that (24) be a presentation-generation of $\widehat{\mathcal{G}}^+_{0,3}$ – in what follows, we shall always tacitly take this "preliminary condition" as understood.

Apparatus for this scan

Scans 188–206

[scan 188]

[p. 393]

2) Determination by α_0, β_0, f.

There is a one-to-one correspondence between the pairs (g, h) satisfying (25), and the pairs

$$(\alpha_0, \beta_0) \qquad (\alpha_0 \in \Pi_{0,3}^{\wedge\sim} = \Pi_{0,3}^{\wedge} \cdot \{1, \tau_\infty\}, \quad \beta_0 \in \Pi_{0,3}^{\wedge}) \tag{31}$$

[d1] via the relations

$$\begin{cases} g = \alpha_0 \rho (\alpha_0)^{-1} = [\alpha_0, \rho] \\ h = \beta_0 \sigma_\infty (\beta_0)^{-1} = [\beta_0, \sigma_\infty] \end{cases} \tag{32}$$

Thus, the $u \in \mathcal{M}_{0,3}^{!\sim} | \mathcal{N}_{0,3}^{!\sim}$ correspond to the systems

$$(\alpha_0, \beta_0, f) \qquad \alpha_0 \in \Pi_{0,3}^{\sim\wedge}, \quad \beta_0, f \in \Pi_{0,3}^{\wedge}, \quad f \text{ determined mod } f \mapsto \ell_0^n f \ (n \in \widehat{\mathbb{Z}}) \tag{33}$$

satisfying the condition on loops[i1] (29), considered as a condition in α_0, β_0, f, [d2] substituting in it for[i2] g, h the values given by (32). The relation is written

$$\sigma_\infty(\beta_0)\beta_0^{-1}\alpha_0\rho(\alpha_0)^{-1} = \sigma_\infty(f^{-1})\ell_1^\nu \rho(f)$$

or again

$$\sigma_\infty(f\beta_0) \underbrace{\beta_0^{-1}\alpha_0}_{(f\beta_0)^{-1}(f\alpha_0)} \rho(f\alpha_0)^{-1} = \ell_1^\nu.$$

or again

$$\boxed{(f\alpha_0)\rho(f\alpha_0)^{-1} = ((f\beta_0)\sigma_\infty(f\beta_0)^{-1})\ell_1^\nu} \tag{34}$$

(loop relation in α_0, β_0, f). As with (29), $\nu \in \widehat{\mathbb{Z}}$ is uniquely determined in terms of|of the α_0, β_0, by the possibility of finding f satisfying relation (34).

The advantage of introducing α_0, β_0 instead

Apparatus for this scan

140-3-s188-D001 *deletion. Manuscript:* satisf

[scan 189]

of g, h is to make unnecessary (since automatic) the relations (25), – only relation (34) remains to be checked. The relations (23) describing u become here:

$$u(\sigma_\infty) = \mathrm{int}(\beta_0)(\sigma_\infty), \qquad u(\rho) = \mathrm{int}(\alpha_0)(\rho) \tag{35}$$

3) Determination by (α, β, f).

The particular form of (34), where the triple $(\alpha_0\ \beta_0\ f)$ enters only through the corresponding pair $(f\alpha_0, f\beta_0)$, leads to setting

$$\alpha = f\alpha_0, \qquad \beta = f\beta_0, \tag{35}$$

we find that the $u \in \mathcal{M}^{!\sim}_{0,3}$ are determined by the triples

$$\begin{array}{cc} & \alpha \in \Pi^{\sim\wedge}_{0,3}, \quad \beta, f \in \Pi^{\wedge}_{0,3}, \quad \alpha, \beta, f \text{ modulo} \\ (\alpha, \beta, f) & \alpha \mapsto \ell_0^n \alpha, \quad \beta \mapsto \ell_0^n \beta, \quad f \mapsto \ell_0^n f \ (n \in \widehat{\mathbb{Z}}) \\ & (\text{the same } n \text{ for } \alpha, \beta, f) \end{array} \tag{36}$$

m880

Marginal note. m880 A disadvantage is the indeterminacy of the pair (α, β), under $(\alpha, \beta) \longrightarrow (\ell_0^n \alpha, \ell_0^n \beta)$ $(n \in \widehat{\mathbb{Z}})$, but this is a minor drawback, which will be removed below.

satisfying the condition

$$\boxed{(\alpha\rho(\alpha)^{-1}) = (\beta\sigma_\infty(\beta)^{-1}) \cdot \ell_1^\nu} \tag{37}$$

(loop relation in α, β). The advantage of this relation is that f no longer appears in it.

We recover α_0, β_0, g, h in terms of α, β, f by the formulas

$$\alpha_0 = f^{-1}\alpha, \qquad \beta_0 = f^{-1}\beta \tag{38}$$

$$g = \alpha_0\rho(\alpha_0)^{-1} = f^{-1}(\underbrace{\alpha\rho(\alpha)^{-1}})\rho(f) = f^{-1}\xi\rho(f) \tag{39}$$

$$h = \beta_0\sigma_\infty(\beta_0)^{-1} = f^{-1}(\beta\sigma_\infty(\beta)^{-1}) = f^{-1}\eta\sigma_\infty(f), \tag{40}$$

where we have set

$$\xi = \alpha\rho(\alpha)^{-1}, \qquad \eta = \beta\sigma_\infty(\beta)^{-1} \qquad (\xi, \eta \in \Pi^{\wedge}_{0,3}) \tag{41}$$

Apparatus for this scan

140-3-s189-D001 *deletion. Manuscript:* =
Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

140-3-s189-D002 *deletion. Manuscript:* [*illeg.* 1]
Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 190]

[p. 394]

The formulas (23) – (35) determining u in terms of the computational data, become here

$$u(\sigma_\infty) = \mathrm{int}(f^{-1}\beta)(\sigma_\infty) \qquad u(\rho) = \mathrm{int}(f^{-1}\alpha)(\rho) \tag{42}$$

i.e.

$$u = \mathrm{int}(f^{-1})u_{\alpha,\beta}, \tag{42bis}$$

where $u_{\alpha,\beta}$ depends only on α, β:

$$\boxed{u_{\alpha,\beta}(\sigma_\infty) = \mathrm{int}(\beta)(\sigma_\infty) = \eta\sigma_\infty} \quad \boxed{u_{\alpha,\beta}(\rho) = \mathrm{int}(\alpha)(\rho) = \xi\rho} \tag{42ter}$$

[i1] Formula (37) can be interpreted as a relation in ξ, η

$$\xi = \eta\ell_1^\nu. \tag{43}$$

4) Determination by (ξ, η, f).

The datum of the pair $(\alpha, \beta) \in \Pi^{\hat{}}_{0,3}{}^{\hat{}} \times \Pi^{\wedge}_{0,3}$, is equivalent to that of the pair (ξ, η) deduced from it by (41), subject to the [d2]equations[i3]

$$\boxed{\begin{cases} \xi\rho(\xi)\rho^2(\xi) = 1 \\ \eta\sigma_\infty(\eta) = 1 \end{cases}} \tag{44}$$

Thus, the datum of $u \in \mathcal{M}^{!\sim}_{0,3}$ is equivalent to that of a triple

$$(\xi, \eta, f) \qquad \begin{array}{c} \xi, \eta, f \in \Pi^{\wedge}_{0,3} \quad \text{modulo} \\ \xi \mapsto \ell_0^n \xi \ell_1^n |\ell_1^{-n}, \quad \eta \mapsto \ell_0^n \eta \ell_1^n |\ell_1^{-n}, \quad f \mapsto \ell_0^n f \end{array} \tag{45}$$

satisfying the relations (44), and the relation

$$\boxed{\xi = \eta\ell_1^\nu}, \tag{46}=(43)$$

which plays the role of "loop relation in ξ, η". The advantage of this presentation is

---

Apparatus for this scan

140-3-s190-I001 *insertion. Manuscript:* i.e.

$$\text{i.e. } u = \mathrm{int}(f^{-1})u_{\alpha,\beta}, \tag{42bis}$$

Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

[scan 191]

the maximal simplicity of the equations (44),(46) – and the fact that f does not enter into them: [d1] the first two equations are equations in ξ alone and in η alone, and the third relates ξ and η in a particularly simple way – in fact if $\mu = 1$, i.e. $\nu = 0$, it is the relation $\xi = \eta$!

The drawback is that there are three equations instead of one, and that we have no explicit expression for $u(\sigma_\infty)$ and $u(\rho)$ in terms of ξ, η, f: we must first, for this, solve the equations [m881]

Marginal note. [m881] but yes, we do have a nice explicit expression (42ter):

$$u(\sigma_\infty) = \mathrm{int}(f^{-1})(\eta\sigma_\infty)$$
$$u(\rho) = \mathrm{int}(f^{-1})(\xi\rho)$$

!!

$$\begin{cases} \alpha\rho(\alpha)^{-1} = \xi & (\alpha \in \Pi^{\sim\wedge}_{0,3}) \\ \beta\sigma_\infty(\beta)^{-1} = \eta & (\beta \in \Pi^{\wedge}_{0,3}) \end{cases} \tag{47}$$

in α, β, to be able then to apply (42).

Another [!][i1] drawback, of importance, is that when we work with the images of the elements under consideration in $\mathrm{Gl}(2, \widehat{\mathbb{Z}})^{\pm\prime|\pm 1}$, the knowledge in this group of ξ, η (even in $\mathrm{Sl}(2, \widehat{\mathbb{Z}})$ itself)[i2] is [d2] a rather weak datum, which in no way allows us to recover α, β as elements of $\mathrm{Gl}(2, \widehat{\mathbb{Z}})^{\pm\prime|\pm 1}$, cf. below.

[scan 192]

[p. 395]

5) Composition with the|with automorphisms that are inner. Cocycle relations for a composite $u'' = u'u$.

Let $\gamma \in \Pi^{\wedge}_{0,3}$, and let us consider the composite

$$u' = \mathrm{int}(\gamma) \circ u \tag{48}$$

it corresponds to invariants

$$f', g', h'|\beta', \alpha'_0, \beta'_0, \alpha', \beta', \xi', \eta'$$

given by

$$\begin{cases} f' = f\gamma^{-1}, \\ g' = \gamma g \rho(\gamma)^{-1}, \quad h' = \gamma h \sigma_\infty(\gamma)^{-1} \\ \alpha'_0 = \gamma\alpha_0, \quad \beta'_0 = \gamma\beta_0 \\ \alpha' = \alpha, \quad \beta' = \beta \\ \xi' = \xi, \quad \eta' = \eta \end{cases} \tag{49}$$

Thus α and β do not change when we replace $u|f$ by $\mathrm{int}(\gamma)u$, they depend only on the outer loop automorphism defined by u, i.e. on the image of u in $\mathcal{N}^{!\sim}_{0,3}$. This is a substantial advantage of the use of (α, β, f) or of (ξ, η, f), in preference to (α_0, β_0, f) or of (g, h, f).

Now let

$$u, u' \in \mathcal{M}^{!\sim}_{0,3}, \quad \text{let } u'' = u'u \tag{50}$$

let

$$\begin{cases} f, g, h, \alpha_0, \beta_0, \alpha, \beta, \xi, \eta \\ f', g', h', \alpha'_0, \beta'_0, \alpha', \beta', \xi', \eta' \qquad \text{and} \\ f'', g'', h'', \alpha''_0, \beta''_0, \alpha'', \beta'', \xi'', \eta'' \end{cases} \tag{51}$$

Apparatus for this scan

140-3-s192-D001 *deletion. Manuscript:* $g' = \gamma g,\ h' = \gamma h$

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 193]

be the invariants relative to u, u', u'' respectively, – we want to express (as far as possible) those of u'' in terms of those of u, u', and we find

$$\begin{cases} g'' = u'(g)g' & \alpha''_0 = u'(\alpha_0)\alpha'_0 * & \alpha'' = (f'u')(\alpha).\alpha' * \\ h'' = u'(h)h' & \beta''_0 = u'(\beta_0)\beta'_0 & \beta'' = (f'u')(\beta).\beta' \end{cases} \tag{52}$$

but $f'' = f'u'(f)$.

m882

Marginal note. m882 $* u'(\alpha_0)$ and $(f'u')(\alpha)$ make sense a priori only if $\alpha_0, \alpha \in \widehat{\Pi}_{0,3}$ i.e. $\mu \equiv 1$ (3), otherwise (for example) we can still define $u'(\alpha_0) = u'\alpha_0 u'^{-1}$, but it will no longer be d2 [illeg. 2] in $\widehat{\Pi}_{0,3}$, and the formula $\alpha''_0 = u'(\alpha_0)\alpha'_0$ will make sense, but will be false !

We thus see that if we consider (for u varying in $\mathcal{M}^{!\sim}_{0,3}$) $f, g, h, \alpha_0, \beta_0, \alpha, \beta$ as functions

$$\mathcal{M}^{!\sim}_{0,3} \longrightarrow \widehat{\Pi}_{0,3}, \text{ or } \widetilde{\Pi}^{\wedge}_{0,3}$$

then $f, g^{-1}, h^{-1}, \alpha_0^{-1}, \beta_0^{-1}$ satisfy the relation for cocycles, and α^{-1}, β^{-1} do too when we restrict ourselves to the d3 subgroup for which $f = 1$, i.e. the automorphisms $u \in \mathcal{M}^{!\sim}_{0,3}$ which normalize d4 $L_0 = \{\ell_0^n \mid n \in \widehat{\mathbb{Z}}\}$. To tell the truth, this statement d5 for f, α, β i1 is a little lame, because of the indeterminacies for f, entailing a corresponding indeterminacy for α, β, $f \mapsto \ell_0^n f$, $\alpha \mapsto \ell_0^n \alpha$, $\beta \mapsto \ell_0^n \beta$. To construct canonical cocycles corresponding to $f, \alpha^{-1}, \beta^{-1}$, it would i2 be necessary to introduce a group extension of $\mathcal{M}^{!\sim}_{0,3}$ by $\widehat{\mathbb{Z}}$, on the model of the special Teichmüller groups, on which f, α, β would be defined without ambiguity. There is no need here to go into detail…

and where ℓ_1 is defined in matrix form by

$$\ell_1 = \begin{pmatrix} 1 & 0 \\ 2 & 1 \end{pmatrix}$$

whence

$$\ell_1^\nu = \begin{pmatrix} 1 & 0 \\ 2\nu & 1 \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ \mu - 1 & 1 \end{pmatrix}. \tag{62}$$

Remark

(Relation with the notations of § 44 (page 356 ff, in particular formulary after page 364). In the groups $\widehat{\Pi}_{0,3}$ and $\widetilde{\Pi}^{\wedge}_{0,3}$, the letters f, g, h of loc. cit. have|are the same meaning as here, but not the letters α, β etc. I shall distinguish by underlines, in the case of deviation between the two notations[i1], the letters with the [d2] meaning used|studied in loc. cit, we find

$$\underline{\alpha} = \alpha_0, \qquad \underline{\beta} = \beta_0 \tag{i}$$

from page 357 on we practically always assume $\underline{\beta} = \beta_0 = 1$, (i.e. $u(\sigma_\infty) = \sigma_\infty$)[i2] so that

$$\boxed{\beta = f\beta_0 = f} \tag{ii}$$

[d3] and loc. cit (17) gives

$$\underline{\varphi} = f\sigma_\infty(f)^{-1} = \beta\sigma_\infty(\beta)^{-1} = \eta \tag{iii}$$

whereas (loc. cit (14))

$$\underline{\xi} = \ell_0^\nu \underline{\varphi} = \ell_0^\nu \eta,$$

comparing with

$$\xi = \eta\ell_1^\nu \qquad (46)$$

we find

$$\underline{\xi} = \ell_0^\nu \xi \ell_1^{-\nu} = \ell_0^\nu \xi \rho(\ell_0^\nu)^{-1}. \tag{iv}$$

i.e. $\underline{\xi}$ is the ρ-transform of ℓ_0^ν. The relation (loc. cit (19|29))

$$\underline{\xi} = \underline{\alpha}_0 \rho(\underline{\alpha}_0)^{-1}$$

compared with $\xi = \alpha\rho(\alpha)^{-1}$ and with (iv)[d5], gives

$$\underline{\alpha}_0 = \ell_0^\nu \alpha. \tag{v}$$

The formulas [d2] (i) to (v)[i1] make it possible to translate the formulary of loc. cit. in terms of the formulary that I am going to make explicit.

We make α and β explicit by their matrices

$$\alpha = \begin{pmatrix} a & b \\ c & d \end{pmatrix}, \qquad \beta = \begin{pmatrix} r & s \\ t & u \end{pmatrix}, \tag{63}$$

where $a, b, c, d, r, s, t, u \in \widehat{\mathbb{Z}}$, with

$$ad - bc = \delta = \varepsilon_3, \qquad ru - st = 1. \tag{64}$$

we shall have

$$\xi = \alpha\rho(\alpha)^{-1} = \begin{pmatrix} A & B \\ C & D \end{pmatrix} \tag{65}$$

with (cf. page 342, (78)|(18))

$$\begin{cases} \delta A = (a^2 + ab + b^2) - (ac + bd + bc), & \delta B = ac + bd + bc \\ \delta C = -(c^2 + cd + d^2) + (ac + bd + ad), & \delta D = c^2 + cd + d^2 \end{cases}, \tag{66}$$

$$\eta = \beta\sigma_\infty(\beta)^{-1} = \begin{pmatrix} R & S \\ T & U \end{pmatrix}, \quad \text{with} \tag{67}$$

$$R = r^2 + s^2, \quad S = T = rt + su, \quad U = t^2 + u^2. \tag{68}$$

The loop relation (60) takes the form

$$\begin{aligned} \begin{pmatrix} A & B \\ C & D \end{pmatrix} &= \varepsilon \begin{pmatrix} R & S \\ T & U \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 2\nu & 1 \end{pmatrix} \\ &= \varepsilon \begin{pmatrix} R + 2\nu S & S \\ T + 2\nu U & U \end{pmatrix}, \end{aligned} \tag{69}$$

[scan 198]

[p. 398]

Let us note the relations (consequences of (66), (67)):

$$(70) \qquad AD - BC = 1 \qquad RU - ST = 1$$

$$(71) \qquad C + D - B = 1 \qquad T = |-S = 1 \quad \text{i.e. } T = S,$$

This [d1]loop[i1] relation (69) [d2] is equivalent to the system of relations

$$(72) \qquad \boxed{\begin{aligned} D &= \varepsilon U \\ \mu D &= 1 \\ B &= \varepsilon S \end{aligned}} \qquad (\text{where } \mu = 2\nu + 1),$$

i.e. to the system of equations

$$(73) \qquad \begin{cases} c^2 + cd + d^2 = \varepsilon(t^2 + u^2) = \delta/\mu \\ ac + bd + bc = \varepsilon(rt + su) \end{cases}$$

It is from the|from [d4]first two relations[i2] (73) that we derive at once

$$(74) \qquad \delta \equiv \mu \ (3), \qquad \varepsilon \equiv \mu \ (4)$$

which characterize the signs δ, ε as

$$(75) \qquad \delta = \varepsilon_3(\mu) = \varepsilon_3, \qquad \varepsilon = \varepsilon_2(\mu) = \varepsilon_2,$$

cf. Theorem page 365.

The formula (83) on page 370 takes here the very simple form (valid without conditions other than those specified so far on α, β, f — f moreover not occurring [d5] for the moment in the formulary):

[scan 199]

$$(76) \qquad \underset{\varepsilon_3 \in \{\pm 1\}}{(\delta)} \quad \alpha(c\rho + d) = \beta(t\sigma_\infty + u)\tau_\infty^{\alpha_2} \qquad (\alpha = \alpha_2)$$

where $\alpha_2 = \alpha$ is defined by the condition

$$(-1)^{\alpha_2} = \varepsilon \quad (= \varepsilon_2).$$

Making (76) explicit by matrix calculation, we have

$$\delta\alpha(c\rho + d) = \delta \begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} d & c \\ -c & c+d \end{pmatrix} = \begin{pmatrix} 1 & B \\ 0 & D \end{pmatrix}$$

$$\beta(t\sigma_\infty + u)\tau_\infty^\alpha = \begin{pmatrix} r & s|-s \\ t|-t & u \end{pmatrix} \begin{pmatrix} u & \varepsilon_2 t|\varepsilon t \\ -t & \varepsilon u \end{pmatrix} = \begin{pmatrix} 1 & \varepsilon S \\ 0 & \varepsilon U \end{pmatrix}$$

so that (76) reduces to the equations

$$D = \varepsilon U, \quad B = \varepsilon S,$$

thus the loop relation $\xi = \varepsilon\eta\ell_1^\nu$ (60|68, 69) is equivalent to the conjunction of (76) and of the relation

$$(77) \qquad \mu D = 1.$$

This being laid down, we shall set (for (α, β) fixed so as to satisfy the loop formula)[i1]

$$(78) \qquad u_{\alpha,\beta} \overset{\text{dfn}}{=} (\mu\delta).\alpha(c\rho + d) = \mu\beta(t\sigma_\infty + u)\tau_\infty^\alpha$$
$$= \mu \begin{pmatrix} 1 & B \\ 0 & D \end{pmatrix} = \begin{pmatrix} \mu & \mu B \\ 0 & 1 \end{pmatrix}$$

so that $u_{\alpha,\beta}$ in fact depends only on α, or only on β and the sign α_2 (which, for its part, is not determined by β, but by α as the value of $\delta(c^2+cd+d^2)$ mod 4…); and we shall set, for a triple (α,β,f) of elements of $\mathrm{Gl}(2,\widehat{\mathbb{Z}})$, $\det f = 1$, α and $\beta|\det\beta$ related by the loop formula

m885

Marginal note. m885 in fact, $u_{\alpha\beta}$ depends only on $\xi = \alpha\rho(\alpha)^{-1}$, and even only on the image $\overline{\xi}|\xi$ of ξ in $\mathrm{Sl}(2,\widehat{\mathbb{Z}})|\mathrm{Sl}(2,\widehat{\mathbb{Z}})'$, the sign being characterized by the condition $\xi\rho(\xi)\rho^2(\xi) = +1$) i.e. depends only on $B, D(=1/\mu\,\dots)$. It should be denoted u_ξ, cf. page 410.

[p. 399]

$$(79)\qquad u_{\alpha,\beta,f} \overset{\text{dfn}}{=} f^{-1}u_{\alpha,\beta} = (\mu\delta)\,\overbrace{f^{-1}}^{\alpha_0}\alpha(c\rho+d) = \\ = \mu\,\underbrace{f^{-1}\beta}_{\beta_0}(t\sigma_\infty+u)\tau_\infty^{\alpha_2}$$

and one finds, as one should,

$$(80)\qquad \begin{cases} u_{\alpha,\beta,f}(\sigma_\infty) = \mathrm{int}(\beta_0)(\sigma_\infty) \\ u_{\alpha,\beta,f}(\rho) = \mathrm{int}(\alpha_0|\beta_0)(\rho) \end{cases},$$

m886

Marginal note. m886

m887

Marginal note. m887 N.B. if|If u,σ are elements of a group G, one of course sets $u(\sigma) = u\sigma u^{-1}$.

m888

Marginal note. m888 this implies that, d1 $\mathrm{int}(u_{\alpha,\beta,f})$ has the same effect, on|in $\mathrm{Sl}(2,\widehat{\mathbb{Z}})'$ as the automorphism u of $\widehat{\mathcal{G}}^+_{0,3}|\widetilde{\mathcal{G}}^{\rightarrow}_{0,3}$ defined (when there is one), by passage to the quotient in $\mathrm{Sl}(2,\widehat{\mathbb{Z}})'$.

formulas which reduce to formulas in which f has again disappeared

$$(81)\qquad \begin{cases} u_{\alpha,\beta}(\sigma_\infty) = \mathrm{int}(\beta)(\sigma_\infty) \\ u_{\alpha,\beta}(\rho) = \mathrm{int}(\alpha|\beta)(\rho) \end{cases},$$

which d2 follow trivially i1 from the two expressions d3 (78) for $u_{\alpha,\beta}$!

The formulas (80) are naturally completed by

$$u_{\alpha,\beta,f}(\varepsilon_0) = \varepsilon\,\mathrm{int}(f^{-1})(\varepsilon_0^{\mu}) \qquad (82)$$

(where $\varepsilon = \varepsilon_2 \in \{\pm 1\}$)

which in turn reduces to

$$u_{\alpha,\beta}(\varepsilon_0) = \varepsilon.\varepsilon_0^{\mu} \qquad (83)$$

where f no longer appears. Since $\varepsilon_0 = \sigma_\infty\rho$, this formula reduces to:

$$u_{\alpha,\beta}(\sigma_\infty)u_{\alpha,\beta}(\rho) = \varepsilon.\varepsilon_0^{\mu},$$

which in view of (81) reduces to:

$$\mathrm{int}(\beta)(\sigma_\infty)\,\mathrm{int}(\alpha|\beta)(\rho) = \varepsilon.\varepsilon_0^{\mu}$$

now the first side is written

$$\beta\sigma_\infty\beta^{-1}\alpha\rho\alpha^{-1} = \underbrace{(\beta\sigma_\infty\beta^{-1}\sigma_\infty)}_{\beta\sigma_\infty(\beta)^{-1}}\underbrace{(\sigma_\infty\rho)}_{\varepsilon_0}\underbrace{(\rho^{-1}\alpha\rho\alpha^{-1})}_{\rho^{-1}(\alpha)\alpha^{-1}=\rho^{-1}(\alpha\rho(\alpha)^{-1})}$$
$$= \eta.\varepsilon_0.\rho^{-1}(\xi) = \eta.\underbrace{(\varepsilon_0\rho^{-1})}_{\sigma_\infty}(\xi).\varepsilon_0 = \eta\sigma_\infty(\xi)\varepsilon_0$$

so relation (83) is also written

$$\eta\sigma_\infty(\xi) = \varepsilon\varepsilon_0^{\mu-1} \quad (= \varepsilon\ell_0^\nu)$$

now one has $\xi = \varepsilon\eta\ell_1^\nu$ (loop relation (60))

so

$$\eta\sigma_\infty(\xi) = \varepsilon\eta\sigma_\infty(\eta)\ell_0^\nu = \varepsilon\ell_0^\nu, \quad \text{OK.}$$

Remark. All these formulas are valid in $\mathrm{Gl}(2,\widehat{\mathbb{Z}})$, without ambiguity of signs, once α, β, f are chosen. If one changes the signs of α or|and of β or both, the loop relation is not modified — and $u_{\alpha,\beta}$ is not changed either, [d3] nor $u_{\alpha,\beta,f}$ (if one does not touch f). On the other hand, a change of sign on f implies a change of sign on $u_{\alpha,\beta,f}$. But such a change of sign of course changes nothing as to the validity of formulas (80), (82). When one makes

[p. 400]

on (α, β, f) the changes the

$$(84) \qquad \alpha' = \ell_0^n\alpha, \qquad \beta' = \ell_0^n\beta, \qquad f' = \ell_0^n f \qquad (n \in \mathbb{Z})$$

then [d1]

$$(85) \qquad \begin{cases} c' = c, \quad d' = d & t' = t, \quad u' = u \\ \underbrace{f'^{-1}\alpha'}_{\alpha'_0} = \underbrace{f^{-1}\alpha}_{\alpha_0} & \underbrace{f'^{-1}\beta'}_{\beta'_0} = \underbrace{f^{-1}\beta}_{\beta_0} \end{cases}$$

[d3]

finally

$$\delta'(=\det\alpha') = \delta(=\det\alpha) \quad (\text{since } \det\ell_0^n = 1)$$
$$(86) \qquad \begin{cases} \text{hence} & \mu'(=\delta'/(c'^2 + c'd' + d'^2)) = \mu(=\delta/(c^2+cd+d^2)) \\ & \text{hence} \quad \varepsilon'_2 = \varepsilon_2, \quad \alpha'_2 = \alpha_2. \end{cases}$$

this is twice what is needed to check with (79)[i1] that

$$(87) \qquad u_{\alpha',\beta',f'} = u_{\alpha,\beta,f}.$$

Let us also recall (cf. proposition page 384)

Proposition. Let $\mu \in \widehat{\mathbb{Z}}^*$, hence the signs $\varepsilon_2 = \varepsilon_2(\mu)$ and $\varepsilon_3 = \varepsilon_3(\mu)$ (defined by $\mu \equiv \varepsilon_2$ (4), $\mu \equiv \varepsilon_3$ (3)), and let $c, d, t, u \in \widehat{\mathbb{Z}}$. For there to exist $a, b, r, s \in \widehat{\mathbb{Z}}$

$$\alpha = \begin{pmatrix} a & b \\ c & d \end{pmatrix}, \qquad \beta = \begin{pmatrix} r & s \\ t & u \end{pmatrix} \quad \text{satisfying (64)}$$

$$ad - bc = \varepsilon_3 \qquad ru - st = 1$$

and the loop relation

$$\alpha\rho(\alpha)^{-1} = \varepsilon_2(\beta\sigma_\infty(\beta^{-1}))\ell_1^\nu \qquad \text{where } \nu = (\mu - 1)/2$$

(i.e. relations (73)) it is necessary and sufficient that one have

$$(88) \qquad \varepsilon_3(c^2 + cd + d^2) = \varepsilon_2(t^2 + u^2) = 1/\mu,$$

and the set|the set of pairs (α, β) satisfying these conditions is a torsor under $\widehat{\mathbb{Z}}$, operating
m890

Marginal note. m890 N.B. For fixed μ, one can always find c, d, t, u satisfying relation (88) — fortunately!

$$(\alpha, \beta) \longmapsto (\varepsilon_0^n \alpha, \varepsilon_0^n \beta).$$

d1

Corollary For one to be able to find α, β such that one has in addition $\alpha \equiv \beta \equiv 1$ (2), it is necessary and sufficient that one have

$$c \equiv t \equiv 0 \text{ (2)} \qquad d \equiv u \equiv 1 \text{ (2)}, \qquad (89)$$

and then the set of solutions (α, β) satisfying these additional conditions is a torsor under $\widehat{\mathbb{Z}}$, operating by

$$(\alpha, \beta) \longmapsto (\ell_0^n \alpha, \ell_0^n \beta).$$

Scholium One can thus say that for an element u[i1] of $\mathcal{N}_{0,3}^{!\sim}$, which defines thus|two α, β in $\Pi_{0,3}^{\sim\wedge}, \Pi_{0,3}^{\wedge}$ (modulo the transformations $(\alpha, \beta) \mapsto (\ell_0^n \alpha, \ell_0^n \beta)$),[i2] (satisfying the loop relation), there are attached to it the "adelic invariants" [d2]

$$\Theta = (\mu, c, d, t, u) \tag{90}$$

(c, d, t, u determined up to ambiguities|ambiguities of sign, and no more) satisfying (88) — and this is the best one can do in the present context: the a, b, r, s have|is not an invariant character. When one has an element $\underline{u}$[i3] of $\mathcal{M}_{0,3}^{!\sim}|\mathcal{N}_{0,3}^{!\sim}$ — i.e. an actual automorphism, not just outer — one has in addition an $\underline{f} \in \Pi_{0,3}^{\wedge}$, giving an $f \in \mathrm{Sl}(2, \widehat{\mathbb{Z}})'$, whence

$$f = \begin{pmatrix} j & k \\ \ell & m \end{pmatrix} \qquad \frac{\text{defined modulo signs}}{\text{and modulo } f \longmapsto \ell_0^n f} \tag{91}$$

[scan 204]

[p. 401]
d1

But this additional datum is a little too [d2] weak to reconstruct [d3] the element

$$\underline{\underline{u}} = \varphi(\underline{u}) = u_{\alpha,\beta,f}$$

of $\mathrm{Gl}(2, \widehat{\mathbb{Z}})'$ associated to u.

It is better to say that for fixed μ, c, d, t, u one has a $\widehat{\mathbb{Z}}$-torsor of $(\alpha, \beta) \equiv (1, 1)$ (2) satisfying the conditions stated in|of the proposition §|, and its corollary, let $T = T_\Theta$, one then makes $\widehat{\mathbb{Z}}$ operate diagonally on $T \times \mathrm{Sl}(2, \widehat{\mathbb{Z}})$ by

$$(\alpha, \beta, f) \longmapsto (\ell_0^n \alpha, \ell_0^n \beta, \ell_0^n f)$$

and one looks at the quotient — this is thus the twist by $\check{T}$ (torsor opposite to T) of $\mathrm{Sl}(2, \widehat{\mathbb{Z}})$, on which $\widehat{\mathbb{Z}}$ operates by $f \longmapsto \ell_0^n f$. [d5] it is the datum of an element f[i2] of

$$\check{T}_\Theta \wedge_{\widehat{\mathbb{Z}}} \mathrm{Sl}(2, \widehat{\mathbb{Z}})$$

m891

Marginal note. m891 it is an $\mathrm{Sl}(2,\widehat{\mathbb{Z}})$-torsor on the right

which makes it possible to define an element

$$\underline{\underline{u}} = u_{\alpha,\beta,f},$$

which changes sign if f is replaced by $(f(-1))$.

Decidedly, these formulations are not exciting, and it is becoming clear that it will be necessary to introduce explicit-

[p. 402]

IV The three fundamental special cases.

We return to the elements g, h, f etc. in $\Pi^{\wedge}_{0,3}$ and $\Pi^{\sim\wedge}_{0,3}$ which correspond to u, which can be described|described in four different ways, by one or another of the four systems

$$(g, h, f), \quad (\alpha_0, \beta_0, f), \quad (\alpha, \beta, f), \quad (\xi, \eta, f). \tag{92}$$

1°|1er Case:[i1] [d1]

$$h = 1, \quad \text{i.e. } \beta_0 = 1, \quad \text{i.e. } \beta = f, \quad \text{i.e. } \eta = f\sigma_\infty(f)^{-1}, \tag{93}$$

i.e.

$$[u, \sigma_\infty] = 1. \tag{94}$$

For a u whatsoever[i2] (i.e. an arbitrary system (g, h, f) etc., there is one and only one inner automorphism $\mathrm{int}(\gamma)$ such that $u' = \mathrm{int}(\gamma)u$[i3] satisfies the preceding property i.e. commutes with σ_∞, [d2] this will be for

$$\gamma = \beta_0^{-1} \qquad \text{(cf. formulas (49)).}$$

[d3]

The u satisfying (93), expressed in terms of triples (ξ, η, f) satisfying the three relations (44) (46) (not involving f), [d4] thus correspond (by the relation $\eta = f\sigma_\infty(f)^{-1}$ of (93)) to the [d5] pairs (ξ, f) of elements of $\Pi^{\wedge}_{0,3}$, satisfying

$$\xi\,\rho(\xi)\,\rho^2(\xi) = 1 \tag{95}$$

$$\xi = (f\sigma_\infty(f)^{-1})\ell_1^\nu \tag{96}$$

with $\nu \in \widehat{\mathbb{Z}}$, as a variable, such that $2\nu + 1 \in \widehat{\mathbb{Z}}^*$[i4]

m892

Marginal note. [m892] N.B. one will have $\xi = fg\rho(f)^{-1}$. in place of f it is permissible|it is legitimate to write here β — but then [illeg. 2] β determined by [illeg. 2] ℓ_0^n [illeg. 2] $f \longmapsto \ell_0^n f$ [illeg. 2]

Scans 207–225

[scan 207]

or to the pairs (α, β) of elements of $\widehat{\Pi}_{0,3}$ satisfying the loop relation (37)

$$(97) = (37) \qquad (\alpha\rho(\alpha)^{-1}) = (\beta\sigma_\infty(\beta)^{-1})\ell_1^\nu$$

(which we will then complete by taking $f = \beta$).
m893

Marginal note. m893 α, β determined modulo $(\alpha, \beta) \longmapsto (\ell_0^n\alpha, \ell_0^n\beta)$.

Up to changing α to $\ell_0^\nu\alpha = \underline{\alpha}_0$, these were the conventions of § 44|§ 4 h (where the formula thus takes the form

$$\underbrace{\underline{\alpha}_0\rho(\underline{\alpha}_0)^{-1}}_{\xi} = \ell_0^\nu \underbrace{(f\sigma_\infty(f)^{-1})}_{\varphi=\eta}$$

).

Taking (79) into account, the conditions
d1

(93) (94) also take the form

$$(98) \qquad u_{\alpha,\beta,f} = \mu(t\sigma_\infty + u)\tau_\infty^{\alpha_2},$$

and imply that $\underline{u} = u_{\alpha,\beta,f}$ d2 normalizes the subalgebra of the matrix algebra $M_2(\widehat{\mathbb{Z}})$ generated by σ_∞ (taking into account the relation

$$(99) \qquad \tau_\infty(\sigma_\infty) = -\sigma_\infty \qquad \text{in } \mathrm{Gl}(2, \widehat{\mathbb{Z}}).$$

If we look at the subgroup of $\mathcal{M}_{0,3}^{!\sim}$ consisting of the u satisfying the equivalent conditions (93) (94) (98)

$$(100) \qquad \mathcal{M}_{0,3}^{!\sim}\left(\frac{1}{2}\right) = \{u \in \mathcal{M}_{0,3}^{!\sim} \mid [u, \sigma_\infty] = 1\} \xrightarrow{\sim} \mathcal{N}_{0,3}^{!\sim}$$

we find that the composite homomorphism

Apparatus for this scan

140-3-s207-D001 *deletion. Manuscript:* 2° Case (98) $g = 1$ i.e. $\alpha_0 = 1$ i.e. $f = \alpha$, i.e. $\xi = f\rho(f)^{-1}$ i.e.

[scan 208]

[p. 403]

(101)

$$\mathcal{N}^{!\sim}_{0,3} \xrightarrow{\sim} \mathcal{M}^{!}_{0,3}(\tfrac{1}{2})^{\sim} \twoheadrightarrow \mathcal{M}^{!\sim}_{0,3} \xrightarrow[u\longmapsto \underline{u}=(u_{\alpha,\beta,f})]{} \mathrm{Gl}(2,\widehat{\mathbb{Z}})'$$

$$k_{1/2}$$

$$\mathcal{N}^{!\sim}_{0,3}(\tfrac{1}{2})$$

m894

Marginal note. m894 N.B. $\mathcal{M}^{!}_{0,3}(\frac{1}{2})^{\sim}$ is stable under $x \longmapsto \sigma_\infty x \sigma_\infty^{-1}$ and under $x \longmapsto \tau_\infty x \tau_\infty^{-1}$ (since σ_∞ and τ_∞ commute with σ_∞).

factors through the said normalizer — if we prefer to view it in terms of the group $\mathrm{Gl}(2,\widehat{\mathbb{Z}}) \simeq M_2(\widehat{\mathbb{Z}})^*$, rather than of the algebra of matrices, it factors through the normalizer of the maximal torus d1

$$T_\alpha | T_\sigma = \{ t\sigma_\infty + u \quad (t,u \in \widehat{\mathbb{Z}} | \mathbb{Z},\ \underbrace{t^2+u^2}_{=\det(t\sigma_\infty+u)} \in \widehat{\mathbb{Z}}^*). \tag{102}$$

I suspect that there is only the splitting $k_{1/2}$ of (101) of the extension $\mathcal{M}^{!\sim}_{0,3}$ (of $\mathcal{N}^{!\sim}_{0,3}$ by $\widehat{\Pi}_{0,3}$, d2 or of $\mathcal{N}^{!\sim}_{0,3}$ by $\widehat{\mathcal{G}}^{+}_{0,3}$) that factors through the normalizer.

m895

Marginal note. m895 Surely bogus: there are also all the curves isogenous to the elliptic curve with modular invariant $j|J=0$ (corresponding d3 the orbit $\{\frac{1}{2}, 2, -1\}$ in $U_{0,3}$ under $\mathfrak{S}_3$).

2° Case This is the case

$$g=1 \quad \text{i.e. } \alpha_0 = 1 \quad \text{i.e. } \alpha = f \quad \text{i.e. } \xi = f\rho(f)^{-1}, \text{ i.e.} \tag{103}$$

$$[u,\rho] = 1. \tag{104}$$

For an arbitrary u, there is a $\gamma \in \widetilde{\widehat{\Pi}}_{0,3} = \widehat{\Pi}_{0,3} \cdot \{1, \tau_\infty\}$ d4 such that $u' = \mathrm{int}(\gamma) \circ u = \gamma u$ commutes|commuting thus with ρ, namely $\gamma = \alpha_0^{-1}$, d5But i2 we will pay Attention to the fact that γ is not always in $\widehat{\Pi}_{0,3}$, in fact

$$\gamma = \alpha_0^{-1} \in \widehat{\Pi}_{0,3} \Longleftrightarrow \varepsilon_3(u) = 1 \quad \text{i.e. } \mu(u) = 1 \ (3) \tag{105}$$

[scan 209]

If we denote by $\mathcal{M}^{!\sim}_{0,3}(-\bar{j})$ the subgroup of $\mathcal{M}^{!\sim}_{0,3}$ consisting of the u satisfying (103), (104), its image in $\mathcal{N}^{!\sim}_{0,3}$ is therefore the subgroup of index 2 kernel of

$$u \longmapsto \underbrace{\varepsilon_3(\mu(u))}_{\sim} = \varepsilon_3(u)$$

i.e.

$$\text{(106)} \qquad \mathcal{N}^{!\sim}_{0,3}(-\bar{j}) = \{u \in \mathcal{N}^{!\sim}_{0,3} \mid \varepsilon_3(u) = 1 \quad \text{i.e. } \mu(u) \equiv 1 \ (3)\}$$

m896

Marginal note. [m896] N.B. $\mathcal{M}^{!\sim}_{0,3}(-\bar{j})$ is stable under $x \longmapsto \rho x \rho^{-1}$.

and we have

$$\text{(107)} \qquad \mathcal{M}^{!\sim}_{0,3}[-\bar{j}] \xrightarrow{\sim} \mathcal{N}^{!\sim}_{0,3}[-\bar{j}].$$

Inverting it we thus find a [d1]splitting[i1]
(108)

$$\mathcal{N}^{!\sim}_{0,3}(-\bar{j}) \xrightarrow{\sim} \mathcal{M}^{!\sim}_{0,3}(-\bar{j}) \hookrightarrow \mathcal{M}^{!\sim}_{0,3}, \qquad k(-\bar{j})$$

, whose composite with $\mathcal{M}^{!\sim}_{0,3}$ is a homomorphism which [d2]factors[i2] through the maximal torus T_ρ of $\mathrm{Gl}(2, \widehat{\mathbb{Z}})'$, formed by the [d3]

$$\text{(109)} \qquad \{c\rho + d \mid c, d \in \widehat{\mathbb{Z}},\ c^2 + cd + d^2 \in \widehat{\mathbb{Z}}^*\}.$$

I suspect that this is the only splitting of $\mathcal{M}^{!\sim}_{0,3}$ (or even of $\mathcal{M}^{!}_{0,3}$) which has this property. This follows from the equivalent form of conditions (103) (104), provided by (79):

bogus, for same reasons as just now…

[scan 212]

[p. 405]

Since we have an isomorphism

$$\mathcal{M}^{!\sim}_{0,3}[0]/L_0\xrightarrow{\sim}\mathcal{N}^{!\sim}_{0,3},$$

we find the

Corollary The group $\mathcal{N}^{!\sim}_{0,3}$ is in canonical bijection with the set of pairs $(\alpha,\beta)\in\Pi^{\sim\wedge}_{0,3}\times\Pi^{\wedge}_{0,3}$ satisfying the loop relation (97)

$$\alpha\rho(\alpha)^{-1}=(\beta\sigma_\infty(\beta)^{-1})\ell_1^{\nu}\qquad(\text{for }\nu\in\widehat{\mathbb{Z}}\text{ suitable}),$$

modulo the transformations $(\alpha,\beta)\mapsto(\ell_0^{n|m}\alpha,\ell_0^{n|m}\beta)$.

The group law (of $\mathcal{M}^{!\sim}_{0,3}(0)$ or of its quotient $\mathcal{N}^{!\sim}_{0,3}$)[i1] is made explicit in terms of the (g,h), or of the (α,β), by the "cocycle formulas" (52): if u',u and $u''=u'\cdot u$[i2] are given by $(g',h'),(g,h),(g'',h'')$, or by $(\alpha',\beta'),(\alpha,\beta)$ and (α'',β''), we will have

$$\begin{cases}g''=u'(g)g' & h''=u'(h)h'\\ \alpha''=u'(\alpha)\alpha' & \beta''=u'(\beta)\beta'.\end{cases}\tag{125}$$

Remark on the notation $\mathcal{M}^{!\sim}_{0,3}(q)$, for $q=\frac{1}{2},-\bar{j},0$. In fact for every algebraic point

$$q\in\mathcal{U}_{0,3}(\mathbb{C})=\mathbb{C}\setminus\{0,1\}=\mathbb{P}^1_{\mathbb{C}|\mathbb{Q}}(\mathbb{C})\setminus\{0,1,\infty\}\tag{126}$$

we expect [d1] a partial splitting

$$k_q:\mathcal{N}|\mathcal{M}^{!\sim}_{0,3}(q)\longrightarrow\mathcal{M}^{!\sim}_{0,3},\qquad\operatorname{Im}k_q\overset{\text{definition}}{=}\mathcal{M}^{!\sim}_{0,3}(q)\tag{127}$$

of the extension $\mathcal{M}^{!\sim}_{0,3}$ of $\mathcal{N}^{!\sim}_{0,3}$ by $\Pi^{\wedge}_{0,3}$, or

m903

Marginal note. [m903] In fact, in a way [illeg. 1] more precise|precise, k_q will only be determined up to an inner automorphism...

[scan 213]

at least we will have[i1] a partial splitting over $\Gamma_{\mathbb{Q}}(q)$, which we will try to determine ; $\mathcal{N}^{!\sim}_{0,3}(q)$ denotes a hypothetical subgroup of $\mathcal{N}^{!\sim}_{0,3}$ (which we would have to manage to determine, if indeed [illeg. 1] not too [illeg. 1]...), inducing on $\Gamma_{\mathbb{Q}}$ the open[i2] subgroup $\Gamma_{\mathbb{Q}}(q)$ of $\Gamma_{\mathbb{Q}}$ stabilizer of q.
m904

Marginal note. m904 The definition is forced for example when q is an element of a cyclotomic extension of $\mathbb{Q}$, in such a way that $\mathbb{Q}(q)$ corresponds to a finite discrete quotient group of $\widehat{\mathbb{Z}}^*$ and $\Gamma_{\mathbb{Q}}(q)$ is the kernel of

$$\Gamma_{\mathbb{Q}} \xrightarrow{\chi} \widehat{\mathbb{Z}}^* \longrightarrow G$$

...

The analysis of cases 1° and 2° above in fact amounted to the determination of such splittings, for $q = \frac{1}{2}$ and for $q = -\overline{j}$ — in the first case $\Gamma_{\mathbb{Q}}(q)$ is the whole of $\Gamma_{\mathbb{Q}}$, in the second it is the subgroup of index 2 kernel of $\varepsilon_2 \circ \chi : \Gamma_{\mathbb{Q}} \longrightarrow \{\pm 1\}$, and idem for $\mathcal{N}|\mathcal{M}^{!\sim}_{0,3}(q)$. By transforming by ρ and ρ^2[i3], we [d1]would deduce[i4] from the splittings|from the splitting $k_{1/2}$ the splittings k_2 and k_{-1} — by transforming by any one of the $\sigma_{i|\rho}$, [d2], we would deduce from the splitting $k_{-\overline{j}}$ a splitting of type $k_{-j|-1}$.

As for $\mathcal{M}^{!\sim}_{0,3}[0]$, it corresponds in principle[i5] to the point

[p. 406]

0 of $\widehat{\mathcal{U}}_{0,3} = \mathbb{P}^1_{\mathbb{Q}}$, there [d1]two other[i1] analogous subgroups $\mathcal{M}^{!\sim}_{0,3}[q]$, with $q = 1$, $q = \infty$, corresponding to the two other points "at infinity" of $\mathcal{U}_{0,3}$, and which are deduced from the preceding one by applying ρ, ρ^2. Here, we have groups which do not correspond strictly[i2] to even[i3] partial sections of $\mathcal{M}^{!\sim}_{0,3}$ over $\mathcal{N}^{!\sim}_{0,3}$, since the intersection with $\Pi^{\wedge}_{0,3}$ is not reduced to 1, but it is one of the three loop groups of type L_0, L_1, L_∞.

But we know that the choice of [i4]a uniformizer|uniformizer of the local ring of $\widehat{\mathcal{U}}_{0,3}$ at 0 (say) determines a splitting of $\mathcal{M}^{!\sim}_{0,3}(0)|[0]$, regarded as an extension of $\mathcal{N}^{!}_{0,3}$ by L_0 — and later on we will have to try to grasp [d2]such a[i5] splitting (associated with a uniformizer)[i6] from the viewpoint of our calculation, as a privileged way [d3], for every [d4] datum mod L_0[i7] of (α, β) satisfying a loop relation, of "normalizing" the choice of the (α, β) mod L_0. I will come back to this later, surely.

[p. 407]

V Recapitulation in terms of $\mathcal{M}^{!\sim}_{0,3}[0]$

It finally appears that the simplest way to study the loop automorphisms of $\Pi^{\wedge}_{0,3}$ (commuting outer^{ly} with $\mathfrak{S}_3$, i.e. the elements of [d1] $\mathcal{N}^{!\sim}_{0,3}$) is to begin with the study of the subgroup $\mathcal{M}^{!\sim}_{0,3}[0]$, normalizer of L_0 in $\mathcal{M}^{!\sim}_{0,3}$[i1]. Setting for $u \in \mathcal{M}^{!\sim}_{0,3}[0]$

$$u(\sigma_\infty) = \eta\sigma_\infty, \qquad u(\rho) = \xi\rho \qquad (\eta, \xi \in \Pi^{\wedge}_{0,3}) \tag{128}$$

i.e.

$$[u, \sigma_\infty] = \eta \qquad [u, \rho] = \xi \tag{129}$$

which express the outer commutation of u with $\mathfrak{S}_3$ (indeed generated by σ_∞ and ρ), the condition of normalizing L_0 is expressed by a relation of the form

$$u(\varepsilon_0) = \varepsilon_0^\mu \quad \text{or} \quad u(\ell_0) = \ell_0^\mu \qquad (\mu \in \widehat{\mathbb{Z}}^*). \tag{130}$$

m905

Marginal note. [m905] (130) is also equivalent, given $[u, \rho] = \xi$, to

$$\begin{cases} u(\varepsilon_1) = \mathrm{int}(\xi)(\varepsilon_1^\mu) \\ \qquad \text{and to} \\ u(\varepsilon_\infty) = \mathrm{int}(\rho^{-1}(\xi^{-1})\,[\textit{illeg. 1}])(\varepsilon_\infty^\mu) \end{cases} \tag{130bis}$$

Now we have, since $\varepsilon_0 = \sigma_\infty\rho$[i2] [d2] [d3] [d4] [d5]

$$u(\varepsilon_0) = u(\sigma_\infty)u(\rho) = \eta\sigma_\infty\xi\rho = \eta\sigma_\infty(\xi)\,\underbrace{\sigma_\infty\rho}_{\varepsilon_0} = \eta\sigma_\infty(\xi)\varepsilon_0$$

so (130) can be written

$$\eta\sigma_\infty(\xi) = \varepsilon_0^{\mu-1} \qquad \text{i.e., setting } \mu - 1 = 2\nu \quad (\nu \in \widehat{\mathbb{Z}})$$

$$\eta\sigma_\infty(\xi) = \ell_0^\nu \qquad \text{i.e., applying } \sigma_\infty$$

$$\sigma_\infty(\eta)\xi = \ell_1^\nu. \tag{131}$$

Now the relations

$$(\eta\sigma_\infty)^2 = 1, \qquad (\xi\rho)^3 = 1 \tag{132}$$

can also be written

$$\boxed{\eta\sigma_\infty(\eta) = 1, \qquad \xi\rho(\xi)\rho^2(\xi) = 1}, \tag{133}$$

whence $\sigma_\infty(\eta) = \eta^{-1}$, so that (131) can also be written in a more convenient way

$$\boxed{\xi = \eta\ell_1^\nu} \qquad \text{(loop relation)} \tag{134}$$

[scan 216]

We thus find the

Theorem The elements u of $\mathcal{M}|\mathcal{N}^{!\sim}_{0,3}[0]$ — i.e. the outer automorphisms of $\Pi^\wedge_{0,3}$ which commute outer^{ly} with $\mathfrak{S}_3$ and which normalize L_0 — are in one-to-one correspondence (via formulas (128) or 129)^{i1} with the pairs (ξ, η) $(\xi, \eta \in \Pi^\wedge_{0,3})$, satisfying relations (133)(134), and such that moreover ("preliminary condition")^{i2} relations (132) (equivalent : (133)) are ^{d1}generating^{i3} for $\widehat{\mathcal{G}}^+_{0,3}$. (^{d2} In (134) ν is a suitable element of $\widehat{\mathbb{Z}}$, obviously uniquely determined, and subject to the additional condition $2\nu + 1 \in \widehat{\mathbb{Z}}^*$) (which is implied by the preliminary condition, and perhaps implies it...)

m906

Marginal note. m906 this condition $2\nu + 1 \in \widehat{\mathbb{Z}}^*$ is in fact a consequence of equations (133), (134), cf. below, theorem page 409!

And the obvious inclusion

$$\begin{aligned} L_0 &\hookrightarrow \mathcal{M}^{!\sim}_{0,3}(0)|(\omega) \\ \ell_0^n = \lambda &\longmapsto \mathrm{int}(\lambda) \end{aligned} \tag{135}$$

is given by

$$\ell_0^n = \lambda \longmapsto (\xi = \lambda\rho(\lambda)^{-1} = \ell_0^n \ell_1^{-n}, \quad \eta = \lambda\sigma_\infty(\lambda)^{-1} = \ell_0^n \ell_1^{-n}) \tag{136}$$

and more generally the left action of L_0 on $\mathcal{M}^{!\sim}_{0,3}(0)|(\omega)$ is given, for $\lambda = \ell_0^n \in L_0$, by

$$(\xi, \eta) \longmapsto (\xi' = \ell_0^n \xi \ell_1^{-n}, \quad \eta' = \ell_0^n \eta \ell_1^{-n}) \tag{137}$$

so

$$\mathcal{M}^{!\sim}_{0,3}[0]/L_0 \simeq \mathcal{N}^{!\sim}_{0,3}$$

is isomorphic to the quotient of the set of pairs (ξ, η) satisfying (133)(134) [and the preliminary condition], by the operations (137) — taking into account a ^{d3} natural group structure : to put on this set of pairs (ξ, η), given by

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 217]

[p. 408]

$$\underbrace{(\xi',\eta')}(\xi,\eta) = (\xi'',\eta'') \tag{138}$$

with

$$\xi'' = u'(\xi)\xi', \qquad \eta'' = u'(\eta)\eta' \tag{139}$$

u' being the automorphism defined by (ξ',η').

Corollary Every $u \in \mathcal{M}^{!\sim}_{0,3}$ can be written under|in the form

$$u = f^{-1}u_{\xi,\eta} = \mathrm{int}(f^{-1}) \circ u_{\xi,\eta}, \tag{140}$$

with $f \in \widehat{\Pi}_{0,3}$ and (ξ,η) satisfying the conditions of the preceding theorem, so that we will have

$$u(\sigma_\infty) = h\sigma_\infty, \qquad u(\rho) = g\rho, \quad \text{with} \tag{141}$$

$$h = f^{-1}\eta\sigma_\infty(f), \qquad g = f^{-1}\xi\rho(f). \tag{143}$$

For us to have

$$f^{-1}u_{\xi,\eta} = f'^{-1}u_{\xi',\eta'}$$

it is necessary and sufficient that there exist $n \in \mathbb{Z}$ such that

$$\xi' = \ell_0^n\xi\ell_1^{-n}, \qquad \eta' = \ell_0^n\eta\ell_1^{-n}, \qquad f' = \ell_0^n f. \tag{144}$$

N.B. Thanks to the loop formula, once the multiplier μ i.e. ν is fixed (and in fact μ is already uniquely determined by the knowledge of ξ alone, as is shown by the adelic calculations in $\mathrm{Gl}(2,\widehat{\mathbb{Z}})'$ ...), ξ and η determine one another by (134)[i1], so we can eliminate one or the other from the system of equations (133), (134), which becomes either

$$\begin{gathered}\xi\rho(\xi)\rho^2(\xi) = 1, \qquad (\xi\ell_1^{-\nu})\sigma_\infty(\xi\ell_1^{-\nu}) = 1 \quad \text{i.e.} \\ \sigma_\infty(\xi) = \ell_1^\nu\xi^{-1}\ell_0^\nu\end{gathered} \tag{145}$$

or

$$\eta\sigma_\infty(\eta) = 1, \qquad (\eta\ell_1^\nu)\rho(\eta\ell_1^\nu)\rho^2(\eta\ell_1^{\nu|-\nu}) = 1. \tag{146}$$

[scan 218]

The adelic calculation. We again denote by ξ, η the images of ξ, η in $\mathrm{Sl}(2, \widehat{\mathbb{Z}})'$, which lift to elements, again denoted ξ, η, of $\mathrm{Sl}(2, \widehat{\mathbb{Z}})$.

There is a sign ambiguity, which we remove for ξ by imposing

$$\xi\rho(\xi)\rho^2(\xi) = \underline{\underline{+}}1 \qquad (\text{in } \mathrm{Sl}(2, \widehat{\mathbb{Z}})) \tag{147}$$

for η[i1] there is no simple way to remove the ambiguity (if we wish to admit provisionally[i2] the possibility of writing in the form $\beta\sigma_\infty(\beta)^{-1}$) of which|thus we will have a priori only

$$\eta\sigma_\infty(\eta) = \pm 1, \tag{148}$$

with no possibility of changing the sign in the 2° case by the change $\eta \mapsto -\eta$! Let us set
m907

Marginal note. m907 but yes, we can make the choice of η by requiring $\xi = +\eta\ell_1^\nu$ (but this convention is not compatible with a convention made elsewhere $\eta = \beta\sigma_\infty(\beta)^{-1}$).

$\in \widehat{\Pi}_{0,3}$

$$\xi = \begin{pmatrix} A & B \\ C & D \end{pmatrix}, \qquad \eta = \begin{pmatrix} R & S \\ T & U \end{pmatrix}. \tag{148}$$

We will have

$$AD - BC = 1 \qquad RU - ST = 1 \tag{149}$$

and relation (147) is then equivalent to :

$$C + D - B = 1, \tag{150}$$

[d2] (at least in each ℓ-adic component we will have to have either this relation, or

$$\xi_\ell = \begin{pmatrix} A_\ell & B_\ell \\ C_\ell & D_\ell \end{pmatrix} = -\rho^{-1} = \begin{pmatrix} 1 & -1 \\ -1 & 0 \end{pmatrix},$$

[d3] proposition on page 394 – but this solution is incompatible with the condition $\boxed{\xi \equiv 1\ (2)}$, whence $A, D \equiv 1\ (2)$ and $B, C \equiv 0\ (2)$ ... so (150) is true in $\mathbb{Z}_\ell$ for $\forall \ell$, hence in $\widehat{\mathbb{Z}}$ ...).

[scan 219]

[p. 409]

Relation (148) can also be written

$$\eta = \pm\sigma_\infty(\eta^{-1})$$

now $\sigma_\infty(\eta^{-1}) = {}^t\eta$, so (148) can be written

$$\eta = \pm{}^t\eta,$$

but if we had the sign $-$, we would have $U = -U$ so $2U = 0$ so $U = 0$, which is incompatible with

$$\eta \equiv \pm 1|1 \quad (2)$$

which implies $R, U \equiv 1$ (2), $S, T \equiv 0$ (2). We will therefore have $\eta = {}^t\eta$ i.e.

$$\eta\sigma_\infty(\eta) = +1, \qquad \text{i.e.} \tag{151}$$

$$S = T. \tag{152}$$

The loop relation (134) can be written

$$\begin{aligned}\begin{pmatrix} A & B \\ C & D \end{pmatrix} &= \varepsilon \begin{pmatrix} R & S \\ T & U \end{pmatrix}\begin{pmatrix} 1 & 0 \\ 2\nu & 1 \end{pmatrix} \\ &= \varepsilon \begin{pmatrix} R + 2\nu S & S \\ T + 2\nu U & U \end{pmatrix} \qquad \text{with } \varepsilon \in \{\pm 1\}\end{aligned} \tag{153}$$

m909

Marginal note. m909 Observation here $\varepsilon = 1$, by choosing the sign of η suitably (153) (the sign convention does not coincide with a previous convention centered on the α, β, but from the present viewpoint it seems more friendly).

and it is equivalent to the relations

$$B = \varepsilon S, \qquad D = \varepsilon U \qquad \text{and} \tag{154}$$

d2

$$\mu D = 1 \qquad \text{where } \mu = 2\nu + 1 \tag{155}$$

equivalent|being equivalent also ; given (154), to

$$\mu U = \varepsilon, \tag{155bis}$$

and the latter merely expresses (taking (152) into account)[i2] the relation

$$\varepsilon \overbrace{(T + 2\nu U)}^{A'} + \overbrace{\varepsilon U}^{B'} - \overbrace{\varepsilon S}^{C'} = 1$$

paraphrasing

$$A + B - C = 1,$$

[scan 220]

it merely expresses (in view of (154) and (150) the relation

$$C = \overbrace{\varepsilon(T + 2\nu U)}^{C'}.$$

Thus the relations (154) (155) express the fact that the two sides of (153) [d1] three coefficients[i1] equal [d2] pairwise[i2], $B = B'$, $C = C'$, $D = D'$[i3], and the equality for the last

$$A = \overbrace{\varepsilon(R + 2\nu S)}^{A'}$$

then follows from this thanks to the relations [d3], [d4]

$$AD - BC = 1, \qquad A'D' - B'C' = 1,$$

which give

$$A = \frac{1 + BC}{D}, \qquad A' = \frac{1 + B'C'}{D'}$$

(N.B. we know that $D = D'$ is invertible, by (155)) hence $A = A'$.

We thus find the

Theorem For a solution (ξ, η) in $\widehat{\Pi}_{0,3} \times \widehat{\Pi}_{0,3}$ of the system of equations (133) (134), again denoting by ξ, η elements of $\mathrm{Sl}(2, \widehat{\mathbb{Z}})$ corresponding to them, the sign ambiguity for ξ being removed by relation (147), we will have the relations (154) and (155), which imply the following consequences:

a) $\mu = 2\nu + 1$ is invertible, and it is entirely determined by ξ – it is determined by η only up to sign.

[scan 221]

[p. 410]

Remark

In view of the relations (149) (150)

$$AD - BC = 1, \qquad A|C + D - B = 1,$$

and of the fact that D is invertible, the matrices ξ are entirely determined by the coefficients B, D — the pairs (ξ, η) of matrices $\in \mathrm{Sl}(2, \widehat{\mathbb{Z}})$, satisfying

$$\begin{cases} \xi\rho(\xi)\rho^2(\xi) = 1, \quad \eta\sigma_\infty(\eta) = 1, \quad \xi = \eta\ell_1^\nu \qquad (\nu \in \widehat{\mathbb{Z}} \text{ suitable}) \\ \qquad\qquad\qquad \xi \equiv 1 \quad (2), \qquad \eta \equiv 1 \quad (2) \end{cases} \tag{156}$$

m910

Marginal note. m910 Of course, the introduction of the congruences here is entirely incidental — the algebraic statement is independent of such conditions...

are in one-to-one correspondence with the pairs (B, D), $B \in \widehat{\mathbb{Z}}$, $D \in \widehat{\mathbb{Z}}^*$, $B \equiv 0$ (2)[i1], from which we deduce

$$\xi = \begin{pmatrix} A & B \\ C & D \end{pmatrix}, \qquad \eta = \begin{pmatrix} R & S \\ T & U \end{pmatrix}, \qquad \text{and } \nu \in \widehat{\mathbb{Z}} \text{ by}$$

$$C = B - D + 1, \qquad A = \frac{1 + BC}{D} = \frac{1}{D}(1 + B^2 - BD + B) \\ = \mu(1 + B + B^2) - B \tag{157}$$

$$\mu = \frac{1}{D}, \qquad \nu = \frac{\mu - 1}{2}, \tag{158}$$

d1

$$\eta = \xi\ell_1^{-\nu} = \begin{pmatrix} A & B \\ C & D \end{pmatrix} \begin{pmatrix} 1 & 0 \\ -2\nu & 1 \end{pmatrix} = \begin{pmatrix} A - 2\nu B & B \\ C - 2\nu D & D \end{pmatrix} \qquad \text{i.e.}$$

m911

Marginal note. m911 we have normalized the sign of η as said in (156)

$$\text{i.e.} \quad U = D, \quad S = T = B, \quad R = A - 2\nu B = \mu(1 + B^2) = \frac{1 + B^2}{D} \tag{159}$$

Put (compare page 398' (78))

$$\underline{u}_\xi = \mu \begin{pmatrix} 1 & B \\ 0 & D \end{pmatrix} = \begin{pmatrix} \mu & \mu B \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} \frac{1}{D} & B/D \\ 0 & 1 \end{pmatrix} \in \mathrm{Gl}(2, \widehat{\mathbb{Z}}) \tag{160}$$

so that knowledge of $\underline{u}_\xi$ is equivalent to that of B and D, i.e. to that[i3] of $\xi \in \mathrm{Sl}(2, \widehat{\mathbb{Z}})$, or again to that of the pairs (ξ, η) (η normalized by $\eta = +\xi \ell_1^{-\nu}$). (In loc. cit. this element was denoted $u_{\alpha,\beta}$... but it depends only on $\xi \in \widehat{\Pi}_{0,3}$, and even only on $\underline{\xi} \in \mathrm{Sl}(2, \widehat{\mathbb{Z}})$ — and knowledge of it is equivalent to that of $\underline{\xi} \in \mathrm{Sl}(2, \widehat{\mathbb{Z}})$ —)

m913

Marginal note. [m913] N.B. We deduce ξ, η from knowledge of $\underline{u}$ by the formulas [d4]

$$\begin{cases} \underline{u} \cdot {}^t\underline{u} = \mu\eta \\ \mu = \det \underline{u} \end{cases} \tag{161}$$

whence

$$\begin{cases} \eta = \mu^{-1} \underline{u} \cdot {}^t\underline{u} = \mu^{-1}, \\ \xi = \eta \ell_1^{-\nu} = \mu^{-1} (\underline{u} \cdot {}^t\underline{u}) \ell_1^{-\nu} \end{cases} \tag{162}$$

[scan 222]

[d1] We will have [d2] [d3]

$$(163) \qquad \underline{u}_\xi(\sigma_\infty) = \eta\sigma_\infty = (\xi\ell_1^{-\nu})\sigma_\infty, \qquad \underline{u}_\xi(\rho) = \xi\rho$$

$$(164) \qquad \underline{u}_\xi(\varepsilon_0) = \varepsilon_0^\mu \qquad \text{and} \qquad u_\xi(\ell_0] = \ell_0^\mu$$

m914

Marginal note. [m914] The formulas (163) can also be written

$$(\underline{u}, \sigma_\infty)|[\underline{u}, \sigma_\infty] = \eta, \quad [\underline{u}, \rho] = \xi \qquad (163 \text{ bis}),$$

they give the way to reconstruct (ξ, η) using $\underline{u}_\xi = \underline{u}$.

If we consider an arbitrary invertible matrix

$$\underline{u} = \begin{pmatrix} L & M \\ N & P \end{pmatrix} \in \mathrm{Gl}(2, \widehat{\mathbb{Z}})$$

the relation

$$\underline{u}(\varepsilon_0) = \varepsilon_0^\mu \quad \text{i.e.} \quad u\varepsilon_0 = \varepsilon_0^\mu \qquad (\text{where } \mu \in \widehat{\mathbb{Z}}^*)$$

[d5]is written[i1]

$$\begin{pmatrix} L & -L+M \\ N & -N+P \end{pmatrix} = \begin{pmatrix} L-\mu N & M-\mu P \\ N & P \end{pmatrix}$$

and is equivalent to: [d6]

$$N = 0, \qquad L = \mu P$$

i.e.

$$\underline{u} = \begin{pmatrix} \mu P & M \\ 0 & P \end{pmatrix}, \qquad \text{whence} \quad \det u = \mu P^2$$

the additional condition

$$(165) \qquad \det \underline{u} = \mu$$

gives the condition

$$P^2 = \underline{1},$$

the most obvious solution being $P = 1$, which gives just the matrices

$$\underline{u} = \begin{pmatrix} \mu & M \\ 0 & 1 \end{pmatrix} = \underline{u}_\xi$$

[p. 411]

where $\xi = \begin{pmatrix} A & B \\ C & D \end{pmatrix}$ [d1] is given|given in terms of B, D by $D = \frac{1}{\mu}$, $B = DM = M/\mu$.

Theorem The map

$$(165) \qquad \begin{array}{ccc} \mathcal{M}^{!\sim}_{0,3}[0] & \longrightarrow & \mathrm{Gl}(2,\widehat{\mathbb{Z}}) \\ u_{\xi,\eta} & \longmapsto & \underline{u}_\xi \\ u & & \end{array} \quad , \quad \text{or again } u \longmapsto \underline{u}$$

$\underline{u}_\xi$ is given by (160)) is a group homomorphism.

m915

Marginal note. [m915] N.B. Since we have restricted ourselves to $\mathcal{M}^{!\sim}_{0,3}(0)$, we get a homomorphism into $\mathrm{Gl}(2,\widehat{\mathbb{Z}})$, not just into $\mathrm{Gl}(2,\widehat{\mathbb{Z}})/\pm 1$.

m916

Marginal note. [m916] N.B. This map factors through the triangular subgroup|subgroup $\mathcal{B}$ below (169)

Proof Let us consider $u = u_{\xi,\eta}$, [d3] $\underline{u}$ is its image in $\mathrm{Gl}(2,\widehat{\mathbb{Z}})$, and if $x \in \widehat{\Pi}_{0,3}$, $\underline{x}$ [d4] its image in $\mathrm{Sl}(2,\widehat{\mathbb{Z}})$: [d5]

$$(166) \qquad \underline{u(x)} = \underline{u}(\underline{x}) \left(\overset{\text{definition}}{=} \underline{u}\,\underline{x}\,\underline{u}^{-1} \right)$$

for it suffices to see it for $x = \sigma_\infty$ and for $x = \rho$, where this formula reduces to (161). This noted, if $u = u_{\xi,\eta} = u_\xi$, $u' = u_{\xi',\eta'} = u_{\xi'}$ are two elements of $\mathcal{M}^{!\sim}_{0,3}(0)$, $u'' = u_{\xi'',\eta''} = u_{\xi''}$ their product, we will have (139)[i3]

$$\xi'' = u'(\xi)\xi'$$

whence

$$\underline{\xi}'' = \underline{u'(\xi)}\,\underline{\xi}' = \underline{u}'(\underline{\xi})\,\underline{\xi}', \quad \text{i.e.}$$

$$(167) \qquad \underline{\xi}'' = \mathrm{int}(\underline{u}_{\underline{\xi}'})(\underline{\xi}) \,.\, \underline{\xi}'.$$

and it suffices to verify that if three solutions [d8] [d9]

$$\xi = \begin{pmatrix} A & B \\ C & D \end{pmatrix}, \quad \xi' = \begin{pmatrix} A' & B' \\ C' & D' \end{pmatrix}, \quad \xi'' = \begin{pmatrix} A'' & B'' \\ C'' & D'' \end{pmatrix}$$

of the equations $AD - BC = 1$, $C + D - B = 1$, $D \in \widehat{\mathbb{Z}}^*$, are related by (167), then we have

$$(168) \qquad \underline{u}_{\xi''} = \underline{u}_{\xi'} \cdot \underline{u}_\xi$$

[scan 224]

Since ξ and $\underline{u} = u_\xi$ determine each other (163bis) it[i1 d1] amounts to the same thing to say that if, on the group

$$\begin{array}{l} \mathcal{B} \subset \mathrm{Gl}(2, \widehat{\mathbb{Z}}) \\ \| \\ \left\{ \begin{pmatrix} \mu & M \\ 0 & 1 \end{pmatrix} \;\middle|\; \mu, M \in \widehat{\mathbb{Z}},\ \mu \text{ invertible} \right\} \end{array} \tag{169}$$

we define (cf. (162))

$$\begin{cases} F_\xi : \mathcal{B} \longrightarrow \mathrm{Sl}(2, \widehat{\mathbb{Z}}) \\ F_\xi(\underline{u}) = (\underbrace{\det \underline{u}}_{\mu})^{-1} \quad \overset{\smile}{[\underline{u}, \rho]} \end{cases} \tag{170}$$

then we have the 1-cocycle relation

$$F_\xi(\underline{u}'\underline{u}) = \mathrm{int}(\underline{u}')(F_\xi(\underline{u})) \,.\, F_\xi(\underline{u}'). \tag{171}$$

By multiplicativity of det, we are reduced[d5] to seeing that

$$\underline{u} \longmapsto [\underline{u}, \rho] = \underline{u}\, \rho(\underline{u})^{-1}$$

satisfies the cocycle relation, which is trivial.

Corollary The map

$$(172)\qquad \begin{aligned} \mathcal{M}^{!\sim}_{0,3} = \mathcal{M}^{!\sim}_{0,3}[0]\,.\,\widehat{\mathcal{G}}^{+}_{0,3} &\longrightarrow \mathrm{Gl}(2,\widehat{\mathbb{Z}})' \\ u_\xi\,.\,a &\longrightarrow (\underline{u}_\xi)'\,.\,\underline{a} \end{aligned}$$

where $(\underline{u}_\xi)'$ is the reduction of $\underline{u}_\xi$ modulo ± 1, and where $\underline{a}$ denotes the image of a in $\mathrm{Sl}(2,\widehat{\mathbb{Z}})'$) is a group homomorphism.

Follows at once from the Theorem and the formulas (163).

m917

Marginal note. m917 careful, this is not a semidirect product, since $\mathcal{M}^{!\sim}_{0,3}(0)\cap\widehat{\mathcal{G}}^{+}_{0,3} = L_0 \neq \{1\}$, we must therefore show that the defining formula does not depend on the way of writing a u in the form $u_\xi a$ — this amounts to seeing that for $\lambda \in L_0$, these two images [illeg. 2] as an element of one or the other factor, are the same.

[p. 412]

From now on I am going to specify|specify the pair $(\underline{\xi},\underline{\eta})$ from the adelic point of view (in $\mathrm{Gl}(2,\widehat{\mathbb{Z}})$) using $\underline{u}_\xi$, which is therefore of the form

$$(173)\qquad \underline{u} = \begin{pmatrix} \mu & M \\ 0 & 1 \end{pmatrix}$$

with $M \equiv 0$ (2) if $\underline{u}$ comes from $\mathcal{M}^{!\sim}_{0,3}(0)^{\mathrm{i1}}$ from which we get ξ,η by the formulas (163 bis)|(167 bis),

$$(174)\qquad \underline{\xi} = [\underline{u},\underline{\rho}],\qquad \underline{\eta} = [\underline{u},\underline{\sigma}_\infty].$$

For $\underline{u} \in \mathcal{M}^{!\sim}_{0,3}(0)$, defined by (ξ, η), as long as we do not bring in the possibility of writing ξ and η uniquely as

$$\xi = \alpha\rho(\alpha)^{-1}, \quad \eta = \beta\sigma_\infty(\beta)^{-1}$$

with $\alpha \in \widetilde{\widetilde{\Pi}}_{0,3}|\widehat{\widetilde{\Pi}}_{0,3}$, $\beta \in \widehat{\Pi}_{0,3}$, the only adelic invariants that we can associate to it directly in a natural way is the pair $(\underline{\xi}, \underline{\eta})$, or again (what amounts to the same thing, but is prettier) $\underline{u}$. The elements [d1]

$$\lambda = \ell_0^n \in L_0 \hookrightarrow \mathcal{M}^{!\sim}_{0,3}[0]$$

correspond to

$$\xi = \eta = \ell_0^n \ell_1^{-n} = \begin{pmatrix} 1 & -2n \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ -2n & 1 \end{pmatrix} = \begin{pmatrix} A = 1 + 4n^2 & B = -2n \\ C = -2n & D = 1 \end{pmatrix} \tag{175}$$

m918

Marginal note. [m918] please do the forgotten check which is referred to in the note in the margin just before…

$$\underline{\lambda} = \underline{\ell_0}^{\,n} | \underline{\ell_0}^{\,n} = \begin{pmatrix} 1 & -2n \\ 0 & 1 \end{pmatrix} \tag{176}$$

moreover we have

$$\underbrace{\begin{pmatrix} 1 & -2n \\ 0 & 1 \end{pmatrix}}_{\underline{\ell_0}^{\,n}} \begin{pmatrix} \mu & M \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} \mu & M - 2n \\ 0 & 1 \end{pmatrix} \tag{177}$$

which shows that [d2] [d3]the quotients of the[i2] subgroups $\mathcal{B}'_1$ of $\mathcal{B}$ (169) consisting of the

Scans 226–244

[scan 226]

matrices $\{\ \underline{u} \in B$ such that $u \equiv 1\ (2)$ i.e. $M \equiv 0\ (2)\}$, by the closed[i1] subgroup $\underline{L}_0$ generated by $\ell_0 = \begin{pmatrix} 1 & -2 \\ 0 & 1 \end{pmatrix}$, is identified with the group of matrices $\begin{pmatrix} \mu & 0 \\ 0 & 1 \end{pmatrix}$ — the[i2] maximal torus T_0 of B, more precisely we have a $\frac{1}{2}$ direct product structure

$$\begin{array}{ccccc} \underline{B}_1 & \simeq & T_0 & \cdot & \underline{L}_0 \\ \| & & \| & & \| \\ \left\{ \begin{pmatrix} \mu & M \\ 0 & 1 \end{pmatrix} \middle| \begin{array}{l} \mu \in \widehat{\mathbb{Z}}^* \\ M \in 2\widehat{\mathbb{Z}} \end{array} \right\} & & \left\{ \begin{pmatrix} \mu & 0 \\ 0 & 1 \end{pmatrix} \middle| \mu \in \widehat{\mathbb{Z}}^* \right\} & & \left\{ \begin{array}{c} \ell_0^n \\ \| \\ \begin{pmatrix} 1 & -2n \\ 0 & 1 \end{pmatrix} \end{array} \middle| n \in \widehat{\mathbb{Z}} \right\} \end{array} \tag{178}$$

This shows that if we are interested in the quotient $\mathcal{M}^{!\sim}_{0,3}(0)/L_0 \xrightarrow{\sim} \mathcal{N}^{!\sim}_{0,3}$, then the only abelian invariant we know how to associate with it in the present context (when we are not working with α, β) is the multiplier μ. But better still, we find thanks to the decomposition (178) in $\mathrm{GL}(2, \widehat{\mathbb{Z}})$ a canonical splitting of the extension $\mathcal{M}^{!\sim}_{0,3}(0)$ of $\mathcal{N}^{!\sim}_{0,3}$ by L_0 :

Proposition For $\forall\, \dot{u} \in \mathcal{N}^{!\sim}_{0,3}$, there is a unique representative $u = u_{\dot{u}} | u = u_\xi \in \mathcal{M}^{!\sim}_{0,3}[0]$ such that we have $\underline{u} \in T_0$ i.e. $\underline{u}$ of the form $\begin{pmatrix} \mu & 0 \\ 0 & 1 \end{pmatrix}$ [i.e. $\xi = \begin{pmatrix} A & B \\ C & D \end{pmatrix}$ of the form $\begin{pmatrix} A & 0 \\ C & D \end{pmatrix} = \begin{pmatrix} *\vert \frac{1}{D} & 0 \\ 1-D & D \end{pmatrix}$][i3], — In other words, the subgroup 225

Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

[scan 227]

[p. 413] d1

$$\mathcal{M}^{!\sim}_{0,3}(0) \overset{\mathrm{df}}{=} \left\{ u \in \mathcal{M}^{!\sim}_{0,3}(0) \,\middle|\, \underline{u} \in T_0 \quad \text{i.e. } \underline{u} = \begin{pmatrix} \mu & 0 \\ 0 & 1 \end{pmatrix} \right\} \tag{179}$$

is a section subgroup of the extension $\mathcal{M}^{!\sim}_{0,3}[0]$ of $\mathcal{N}^{!\sim}_{0,3}$ by L_0, hence also of the extension $\mathcal{M}^{!\sim}_{0,3}$ of $\mathcal{N}^{!\sim}_{0,3}$ by $\widehat{\Pi}_{0,3}$, or of the extension $\mathcal{M}^{\sim}_{0,3}$ of $\mathcal{N}^{!\sim}_{0,3}$ by $\widehat{\mathcal{G}}^{+}_{0,3}$.

This|That comes from the fact that if $u \in \mathcal{M}^{!\sim}_{0,3}[0]$ defines[i1] $\underline{u} = \begin{pmatrix} \mu & M \\ 0 & 1 \end{pmatrix}$, thus with $M \equiv 0\ (2)$, i.e. $M \in 2\widehat{\mathbb{Z}}$, there is a unique $n \in \widehat{\mathbb{Z}}$ such that $\underline{\ell_0^n u} = \begin{pmatrix} \mu & M - 2n \\ 0 & 1 \end{pmatrix}$ is in T_0 i.e. such that $\ell_0^n u \in \mathcal{M}^{!\sim}_{0,3}(0)$, namely $n = \dfrac{M}{2}$.

If (ξ, η) satisfy conditions (133)(134) i.e. define a $u = u_{\xi,\eta}$ (cf. Theorem page 407'), then we shall say that (ξ, η) is normalized if we have $u_{\xi,\eta} \in \mathcal{M}^{!\sim}_{0,3}(0)$. Likewise, if an arbitrary element of $\mathcal{M}^{!\sim}_{0,3}$ is written in the form

$$u = \cdot f^{-1} \cdot u_{\xi,\eta} = f^{-1} u_{\xi},$$

we say that this representation (tainted with the indeterminacy (136))[i2] is normalized, if $u_{\xi,\eta} = u_{\xi}$ is normalized, [i.e. if for[i3] $\xi \simeq \begin{pmatrix} A & B \\ C & D \end{pmatrix}$ [d3] we have $B = 0$]. Thus, [d4] u can be written uniquely in the form

$$u_{f,\xi,\eta} = f^{-1} u_{\xi}, \tag{179}$$

[scan 228]

with $f|\xi$ normalized. In fact, this corresponds to the $\frac{1}{2}$-direct product decomposition

$$\mathcal{M}^{!\sim}_{0,3} \simeq \mathcal{M}^{!\sim}_{0,3}(0) \cdot \widehat{\Pi}_{0,3}, \tag{180}$$

moreover we likewise have

$$\mathcal{M}^{\sim}_{0,3} \simeq \mathcal{M}^{!\sim}_{0,3}(0) \cdot \widehat{\mathcal{G}}^{+}_{0,3}. \tag{181}$$

Remark We should at some point try to relate these canonical splittings to the choice of a uniformizer at 0 of $\mathbb{P}^1_{\mathbb{Q}} = \widehat{U}_{0,3\mathbb{Q}}$. Of course, the same question also arises at|for the other two[i1] "points at infinity" $1, \infty$ of $U_{0,3\mathbb{Q}}$, relative to the section subgroups

$$\mathcal{M}^{!\sim}_{0,3}(q) \qquad q \in \{0, 1, \infty\} \tag{182}$$

corresponding to these points at infinity — the construction of a section-group $\mathcal{M}^{!\sim}_{0,3}(0)$ in the normalizer of L_0, obviously applies without change for L_1, L_∞. We shall moreover have

$$\rho(\mathcal{M}^{!\sim}_{0,3}(q)) = \mathcal{M}^{!\sim}_{0,3}(\dot{\rho}|\rho(q)) \qquad \text{for } q \in \{0, 1, \infty\}, \tag{183}$$

so the three[i2] $\mathcal{M}^{!\sim}_{0,3}(q)$ are obtained from any one of them by applying ρ, ρ^2. 227

[scan 229]

[p. 415] 47. Return to the homomorphism $\widehat{\Pi}_{0,3} \xrightarrow{\widehat{\varphi}} \widehat{\mathcal{G}}^{+}_{0,3}$ and the condition of commutation with it up to inner automorphisms. The groups $\mathcal{M}^{!\approx}_{0,3}, \mathcal{M}^{\approx}_{0,3}$ and the homomorphism $\Phi : \mathcal{M}^{!\approx}_{0,3} \longrightarrow \mathcal{M}^{\approx}_{0,3}$.

Recall (§41)[i1] that $\widehat{\varphi}$ is described by

$$\widehat{\varphi}(\ell_0) = \varepsilon_0 = \sigma_\infty \rho, \quad \widehat{\varphi}(\ell_1) = \sigma_\infty, \quad \widehat{\varphi}(\ell_\infty) = \rho^{-1}. \tag{1}$$

Let

$$u = u_{\alpha,\beta,f} \quad \in \mathcal{M}^{!\sim}_{0,3}$$

be a loop automorphism of $\widehat{\Pi}_{0,3}$, commuting with $\mathcal{G}_3$ up to inner automorphisms, defined by

$$u(\sigma_\infty) = h\sigma_\infty = \mathrm{int}(\beta_0)\sigma_\infty \quad \left(\begin{array}{l} h = \beta_0 \sigma_\infty (\beta_0)^{-1}, \\ \beta_0 = f^{-1}\beta \end{array} \right) \tag{2}$$

$$u(\rho) = g\rho = \mathrm{int}(\alpha_0)\rho \quad \left(\begin{array}{l} g = \alpha_0 \rho (\alpha_0)^{-1}, \\ \alpha_0 = f^{-1}\alpha \end{array} \right) \tag{3}$$

and let us write that u commutes with φ up to inner automorphisms, i.e. that there exists [d2]

$$\lambda \in \widehat{\Pi}_{0,3} \tag{4}$$

such that we have

$$\widehat{\varphi} u(x) = \mathrm{int}(\lambda) u \widehat{\varphi}(x) \qquad \forall x \in \widehat{\Pi}_{0,3}. \tag{5}$$

It suffices to check (5) for $x = \ell_0$ and $x = \ell_1$.

1) Case $x = \ell_0$ [d3], whence

$$u(x) = \mathrm{int}(f^{-1})(\ell_0^\mu)$$

$$\widehat{\varphi}(u(x)) = \mathrm{int}(\widehat{\varphi}(f)^{-1})\widehat{\varphi}(\ell_0^\mu) = \mathrm{int}(\widehat{\varphi}(f)^{-1})\varepsilon_0^\mu$$

$$u\widehat{\varphi}(x) = u(\varepsilon_0) = \mathrm{int}(f^{-1})(\varepsilon_0^\mu)$$

so the relation (5) reads

$$\mathrm{int}(\widehat{\varphi}(f)\lambda f^{-1})(\varepsilon_0^\mu) = \varepsilon_0^\mu$$

[scan 230]

is equivalent to

$$\widehat{\varphi}(f)\lambda f^{-1} \in L_0^{\sim} \quad \left(= \mathrm{Centr}_{\widehat{\Pi}_{0,3}}(\varepsilon_0^\mu)\right)$$

m923

Marginal note. m923 N.B. we do not necessarily have $\widehat{\varphi}(f) \in \widehat{\Pi}_{0,3}$, so neither [illeg. 1] $\widehat{\varphi}(f)\lambda f^{-1} \in \widehat{\Pi}_{0,3}$ ...

i.e. to the existence of $r \in \widehat{\mathbb{Z}}$ such that we have

$$\widehat{\varphi}(f)\lambda f^{-1} = \varepsilon_0^r,$$

i.e.

$$\lambda = \widehat{\varphi}(f)^{-1}\varepsilon_0^r f. \tag{6}$$

This thus makes it possible to eliminate $\exists\lambda$ from the second relation :

2) Case $x = \ell_1$, whence

$$u(x) = \mathrm{int}(f_1^{-1})(\ell_1^\mu) \qquad (f_1^{-1} = g\rho(f^{-1}))$$

$$\widehat{\varphi}(u(x)) = \mathrm{int}(\widehat{\varphi}(f_1)^{-1})\sigma_\infty^\mu = \mathrm{int}(\widehat{\varphi}(f_1))\sigma_\infty$$

(taking into account that $\sigma_\infty^\mu = \sigma_\infty$ since $\mu \equiv 1$ (2)). d4

$$u\widehat{\varphi}(x) = u(\sigma_\infty) = \mathrm{int}(\beta_0)(\sigma_\infty),$$

So the relation (5) reads

$$\mathrm{int}(\widehat{\varphi}(f_1)^{+1}\lambda\beta_0)\sigma_\infty = \sigma_\infty,$$

which also means that there exists $i|\alpha \in \mathbb{Z}/2\mathbb{Z}$ such that we have d5

$$\widehat{\varphi}(f_1)^{+1}\lambda\beta_0 = \sigma_\infty^i \quad \text{i.e.} \quad \widehat{\varphi}(f_1^{-1})^{+1} = \lambda\beta_0\sigma_\infty^i,$$

and replacing λ by its value (6), and f_1^{-1} by its value $g\rho(f^{-1})$, we find the condition

$$\widehat{\varphi}(g\rho(f)^{-1}) = \widehat{\varphi}(f)^{-1}\varepsilon_0^r \underbrace{f\beta_0}_{\beta}\sigma_\infty^\alpha \quad \text{i.e.}$$

$$\widehat{\varphi}(\underbrace{fg\rho(f)^{-1}}_{\xi=\alpha\rho(\alpha)^{-1}}) = \varepsilon_0^r\beta\sigma_\infty^\alpha$$

[scan 231]

[p. 416]

Thus :

Theorem For

$$\widehat{\varphi} : \widehat{\Pi}_{0,3} \longrightarrow \widehat{\mathcal{G}}^+_{0,3}$$

to commute up to inner automorphisms with the element $u \in \mathcal{M}^{!\sim}_{0,3}$, corresponding to the invariants $g, h, f, \alpha_0, \beta_0, \alpha, \beta, \xi, \eta$ (cf. §46), it is necessary and sufficient that we have

$$\widehat{\varphi}(\xi) = \varepsilon_0^r \beta \sigma_\infty^{i|\alpha} \qquad \text{for } r \in \widehat{\mathbb{Z}}, \quad \alpha \in \mathbb{Z}/2\mathbb{Z} \text{ suitable.} \tag{7}$$

m925

Marginal note. m925 N.B. r, α are well determined when α and β (or again ξ and β) are chosen.

We shall then have (5), with d2 λ given by (6) ; $\lambda = \widehat{\varphi}(f)^{-1}\ell_0^r f$.

Note that u defines the triple (α, β, f) only modulo a transformation of the form d3

$$(\alpha, \beta, f) \longmapsto (\alpha' = \ell_0^n \alpha,\ \beta' = \ell_0^n \beta,\ f' = \ell_0^n f) \tag{8}$$

where $n \in \widehat{\mathbb{Z}}$. We shall then have (putting $\xi' = \alpha'\rho(\alpha')^{-1} = \ell_0^n \xi \ell_1^{-n}$)

$$\widehat{\varphi}(\xi') = \varepsilon_0^{r'} \beta' \sigma_\infty^{i'|\alpha'} \tag{*}$$

with $r' \in \widehat{\mathbb{Z}}$, $i'|\alpha' \in \mathbb{Z}/2\mathbb{Z}$ also well determined. Now we shall have

$$\begin{aligned} \widehat{\varphi}(\xi') &= \widehat{\varphi}(\ell_0^n \xi \ell_1^{-n}) \\ &= \widehat{\varphi}(\ell_0^n)\widehat{\varphi}(\xi)\widehat{\varphi}(\ell_1^{-n}) \\ &= \varepsilon_0^n \widehat{\varphi}(\xi)\sigma_\infty^{-n} \end{aligned}$$

d4d5 and the relation (*) reads

$$\widehat{\varphi}(\xi) = \varepsilon_0^{r'-n|r'-2n}\beta'\sigma_\infty^{i'-n|\alpha'-n}$$

or again, since $\beta' = \ell_0^n\beta = \varepsilon_0^{2n}\beta$

$$\widehat{\varphi}(\xi) = \varepsilon_0^{r'+n}\beta\sigma_\infty^{\alpha'-n|i'-n},$$

which, compared with (7), gives

$$r' = r - n, \qquad i'|\alpha' = i|\alpha + n \bmod 2. \tag{9}$$

[scan 232]

This implies the

Corollary 1 Let us suppose that u commutes with $\widehat{\varphi} : \widehat{\Pi}_{0,3} \longrightarrow \widehat{\mathcal{G}}^+_{0,3}$ up to inner automorphisms. Then it is possible in a unique way to describe $u|\varphi$ by a triple (α, β, f) (a priori determined modulo a transformation of type (8), in such a way that we have (putting $\xi = \alpha\rho(\alpha)^{-1}$, as usual) a relation

$$\boxed{\widehat{\varphi}(\xi) = \beta\sigma_\infty^i} \qquad \text{for } i \in \mathbb{Z}/2\mathbb{Z} \text{ suitable.} \tag{10}$$

m927

Marginal note. m927 We should examine whether this definition coincides with that on the page 410', 413|417, formulated without involving $\widehat{\varphi}$.

Such a choice will be called normalized.

Thus the $u \in \mathcal{M}^{!\sim}_{0,3}$ which commute with $\widehat{\varphi}$ up to inner automorphisms correspond one-to-one to the d1 triples d2 d3

$$(\alpha, \beta, f), \qquad \alpha \in \widetilde{\widehat{\Pi}}_{0,3}, \quad \beta, f \in \widehat{\Pi}_{0,3}$$

satisfying, on the one hand the loop relation

$$\xi \doteq | = \eta\ell_1^\nu \qquad \begin{array}{c}\text{where } \xi = \alpha\rho(\alpha)^{-1}, \quad \eta = \beta\sigma_\infty(\beta)^{-1}, \\ \text{and where } \nu \in \widehat{\mathbb{Z}} \text{ suitable} \\ (\text{such that } 2\nu + 1 \in \widehat{\mathbb{Z}}^*)\end{array} \tag{11}$$

on the other hand relation (10) (for suitable $i \in \mathbb{Z}/2\mathbb{Z}$) — neither relation moreover involving f. 231

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 233]

[p. 417]

Let us note that $i \in \mathbb{Z}/2\mathbb{Z}$ is defined in terms of ξ (taking into account $\beta \in \widehat{\Pi}_{0,3} = \mathrm{Ker}(\widehat{\mathcal{G}}^{+}_{0,3} \to \mathcal{G}_3|\mathfrak{S}_3)$) by reducing (10) modulo $\widehat{\Pi}_{0,3}$. Denoting by

$$\widehat{\varphi}^{\bullet} : \widehat{\Pi}_{0,3} \longrightarrow \mathcal{G}_3|\mathfrak{S}_3 \tag{12}$$

the composite

$$\widehat{\Pi}_{0,3} \overset{\widehat{\varphi}}{\to} \widehat{\mathcal{G}}^{+}_{0,3} \overset{\mathrm{can}}{\longrightarrow} \mathcal{G}_3|\mathfrak{S}_3,$$

formula (10) also gives

$$\widehat{\varphi}^{\bullet|\circ}(\xi) = \sigma_{\infty}^{i} \tag{13}$$

which does determine $i \in \mathbb{Z}/2\mathbb{Z}$[i1] in terms of $\xi \in \widehat{\Pi}_{0,3}$, and implies an intrinsic condition on the element ξ of $\widehat{\Pi}_{0,3}$, namely that its image in $\mathcal{G}_3|\mathfrak{S}_3$ under $\widehat{\varphi}^{\bullet|\circ}$ should indeed be in the subgroup $\{1, \sigma_{\infty}\}$ of $\mathcal{G}_3|\mathfrak{S}_3$. In fact, the kernel of $\widehat{\varphi}^{\bullet|\circ}$ is the inverse subgroup of $\widehat{\Pi}_{0,3}$ generated by $\ell_0^2, \ell_1^2, \ell_{\infty}^3$, and the condition being considered therefore means that modulo this subgroup, ξ should be of the form ℓ_1^i.

By formula (10), we can eliminate β from the datum (α, β, f), and we can replace the datum α by the datum ξ. Thus: 232

Apparatus for this scan

140-3-s233-I001 *insertion. Manuscript:* $\in \mathbb{Z}/2\mathbb{Z}$
Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

[scan 234]

Corollary 2 The elements of the [s]/group of $\mathcal{M}^{!\sim}_{0,3}$ formed by the u which commute with $\widehat{\varphi}$ up to inner automorphisms, is [d1] in one-to-one correspondence with the set of pairs (ξ, f) [d2] $(\xi, f \in \widehat{\Pi}_{0,3})$ satisfying the conditions (not|by involving anything but ξ)

$$(14) \qquad \boxed{\xi\rho(\xi)\rho^2(\xi) = 1}$$

$$(15) \qquad \boxed{\xi = (\widehat{\varphi}(\xi)\,\sigma_{\infty}(\widehat{\varphi}(\xi))^{-1})\ell_1^{\nu}}$$

$(\nu \in \widehat{\mathbb{Z}}$ suitable such that $2\nu + 1 \in \widehat{\mathbb{Z}}^{*})$.

m930

Marginal note. [m930] we also need the "preliminary" "condition"…

For such a ξ, $\widehat{\varphi}^{\bullet|\circ}(\xi)$ in $\mathcal{G}_3|\mathfrak{S}_3$ is of the form σ_∞^i, with $i \in \mathbb{Z}/2\mathbb{Z}$, and putting

$$\begin{cases} \beta = \widehat{\varphi}(\xi)\sigma_\infty^i \quad (\in \widehat{\Pi}_{0,3}) \\ \alpha \in \widehat{\Pi}_{0,3} \quad \text{the unique element of } \widetilde{\widehat{\Pi}}_{0,3} = \widehat{\Pi}_{0,3} \cdot \{1, \tau_\infty\} \\ \qquad\qquad \text{such that } \alpha\rho(\alpha)^{-1} = \xi \end{cases} \tag{16}$$

u is obtained from ξ, f by the formulas

in fact, we do not really need α, β

$$\begin{cases} u(\sigma_\infty) = \mathrm{int}(f^{-1}\beta)(\sigma_\infty) \\ \qquad\quad = \mathrm{int}(f^{-1})(\mathrm{int}(\beta)(\sigma_\infty)) \\ \qquad\quad = \mathrm{int}(f^{-1})(\xi\ell_1^{-\nu}\sigma_\infty) \\ u(\rho) = \mathrm{int}(f^{-1}\alpha)(\rho) \\ \qquad\quad = \mathrm{int}(f^{-1})(\mathrm{int}(\alpha)(\rho)) \\ \qquad\quad = \mathrm{int}(f^{-1})(\xi\rho) \end{cases} \tag{17}$$

We shall note that in these formulas, f enters only through composition with $\mathrm{int}(f)$. If we [d3]denote[i1], for $\xi \in \widehat{\Pi}_{0,3}$ 233

[p. 418]
m933

Marginal note. [m933] This notation is already in use for the general considerations of the preceding §$u_{\xi,\eta}$ depends in any case only on ξ…

satisfying (14)(15), by u_ξ the automorphism [d1] corresponding, in terms of Corollary 2, to the pair $(\xi, 1)$, so that

$$\begin{cases} u_\xi(\sigma_\infty) = \overbrace{(\xi\ell_1^{-\nu})}^{\eta|\nu}\sigma_\infty\ , \\ u_\xi(\rho) = \xi\rho \end{cases} \tag{18}$$

formulas (17) can also be written, simply

$$u_{\xi,f} = \mathrm{int}(f^{-1})\, u_\xi. \tag{19}$$

On the other hand formulas (5), (6) give here

$$\widehat{\varphi} \circ u_\xi = u_\xi \circ \widehat{\varphi} \tag{20}$$

where, of course, on the first side|side u_ξ denotes the restriction of u_ξ to $\widehat{\Pi}_{0,3}$.

Let us note

Corollary 3 The loop automorphisms of $\widehat{\mathcal{G}}^{+}_{0,3}$ of the form u_ξ (ξ normalized|normalized*)[i1] are exactly those for which we have the [d3] formulas (20) (i.e. which [d4] commute with $\widehat{\varphi}$) and which moreover normalize L_0.

[scan 236]

Indeed, in terms of the triples[i1] (α, β, f) "special"[i2] these properties are expressed by the simple[i3] conditions [d1] f of the form ℓ_0^n (which expresses the condition of normalizing L_0) and that λ given by (6) case|for $r = 0$, i.e.

$$\lambda = \widehat{\varphi}(f)^{-1} f \tag{21}$$

be equal to 1, i.e. the condition

$$\widehat{\varphi}(f) = f, \tag{22}$$

which in this case reads

$$\varepsilon_0^n = \underbrace{\ell_0^n}_{\varepsilon_0^{2n}} \qquad \text{i.e.} \quad \varepsilon_0^n = 1$$

which implies $f|f_0 = \ell_0^n = 1$, hence u of the form $u_{(\alpha,\beta,1)} = u_\xi$, where $\xi = \alpha\rho(\alpha)^{-1}$.

Corollary 4 The u_ξ normalized[i4] form a subgroup of $\mathrm{Norm}_{\mathcal{M}^{!\sim}_{0,3}}(L_0)$, i.e. $\mathcal{M}^{!\approx}_{0,3}(0)$, whose [d2]intersection[i5] with $\widehat{\Pi}_{0,3}$ is reduced to $\{1\}$, and whose image in $\mathcal{N}^{!\sim}_{0,3}$ is the subgroup $\mathcal{N}^{!\approx}_{0,3}$[i6] formed by the outer loop automorphisms of $\widehat{\mathcal{G}}^{+}_{0,3}$, stabilizing $\widehat{\Pi}_{0,3}$ (i.e. $u \in \widehat{\mathcal{M}^{+}_{0,3}}$) such that $\widehat{\varphi} : \widehat{\Pi}_{0,3} \to \widehat{\mathcal{G}}^{+}_{0,3}$ commutes with u up to inner automorphisms. We therefore have an isomorphism

$$\mathcal{M}^{!\approx}_{0,3}(0) = \{u_\xi \mid \xi \in \widehat{\Pi}_{0,3} \text{ solution of (14)(15)}\} \xrightarrow{\sim} \mathcal{N}^{!\approx}_{0,3}. \tag{23}$$

[p. 419]

It only remains to check that a u_ξ can be an inner automorphism only if $u_\xi = 1$ i.e. $\xi = 1$ (hence $\nu = 0$). Now u_ξ is a $u_{\alpha,\beta} = u_{\alpha,\beta,1}$ (α, β defined d1 via ξ by $\alpha\rho(\alpha)^{-1} = \xi$, $\beta\sigma_\infty(\beta)^{-1} = \xi\ell_1^{-\nu}$), which is an inner automorphism iff we have $\alpha = \ell_0^n$, $\beta = \ell_0^n$ (cf. proposition on page 404), i.e. $\xi = \ell_0^n\ell_1^{-n}$, $\eta = \beta\sigma_\infty(\beta)^{-1} = \ell_0^n\ell_1^{-n}$, and d2 d3 $\xi = \eta\ell_1^\nu$ reads $\ell_1^\nu = 1$ i.e. $\nu = 0$. Relation (15) therefore becomes (since

$$\widehat{\varphi}(\xi) = \widehat{\varphi}(\ell_0^n\ell_1^{-n}) = \varepsilon_0^n\sigma_\infty^n$$
$$\sigma_\infty(\widehat{\varphi}(\xi)) = \varepsilon_1^n\sigma_\infty^n$$

) d4 the relation

$$\ell_0^n\ell_1^{-n} = \varepsilon_0^n\sigma_\infty^{-n}\varepsilon_1^n\sigma_\infty^n,$$

i.e. (since $\ell_0 = \varepsilon_0^2$, $\ell_1 = \varepsilon_1^2$) if n even

$$\varepsilon_0^n = \varepsilon_1^{3n} \qquad \text{whence } n = 0,$$

and if n odd

$$\varepsilon_0^n = \underbrace{\sigma_\infty\varepsilon_1^n\sigma_\infty}_{\sigma_\infty(\varepsilon_1)^n = \varepsilon_0^n}\ \varepsilon_1^{2n}$$

i.e. $\varepsilon_1^{2n} = 0$, i.e. again $n = 0$, q.e.d.

this subgroup contains $\Gamma_{\mathbb{Q}}$, we therefore find a section of the extension $\mathcal{M}^!_{0,3}$ of $\Gamma_{\mathbb{Q}}$ by $\widehat{\Pi}_{0,3}$, [d1] which is in|in[i1] fact a section of the subgroup of $\mathcal{M}^!_{0,3}$ which is the normalizer of L_0. We should check that this canonical section is associated with the choice of a uniformizer at the point 0 of $\widehat{U}_{0,3\mathbb{Q}}$, [d2] whose image in[i2] $\mathfrak{m}_0/\mathfrak{m}_0^2$ should be well[i3] determined, where $\mathfrak{m}_0$ denotes the maximal ideal of the local ring at 0 in $\widehat{U}_{0,3\mathbb{Q}} = \mathbb{P}^1_{\mathbb{Q}}$) — we should determine this element of $\mathfrak{m}_0/\mathfrak{m}_0^2$ — We feel like taking an element which is, not only a basis over $\mathbb{Q}$, but even (in the situation over the integers) a basis over $\mathbb{Z}$ — [d3] condition[i4] which indeed determines an element of $\mathfrak{m}_0/\mathfrak{m}_0^2$ up to sign — this would be in fact the choice corresponding to the uniformizer z, or $-z$. But is it really the right one? We should come back to this! 237

[scan 239]

[p. 420]

Let us work henceforth in the subgroup $\mathcal{M}^{!\approx}_{0,3}$ of $\mathcal{M}^{!\sim}_{0,3}$, consisting of the u which commute as outer actions with $\widehat{\varphi}$, i.e. inverse image of $\mathcal{N}^{!\approx}_{0,3}$, so that we have

$$1 \longrightarrow \widehat{\Pi}_{0,3} \longrightarrow \mathcal{M}^{!\approx}_{0,3} \longrightarrow \mathcal{N}^{!\approx}_{0,3} \longrightarrow 1 \qquad \begin{matrix} \cup \\ \Gamma_{\mathbb{Q}} \end{matrix} \tag{24}$$

We have therefore found a section subgroup

$$\mathcal{M}^{!\approx}_{0,3}(0) \xrightarrow{\sim} \mathcal{N}^{!\approx}_{0,3} \tag{25}$$

d1

$$\{u_\xi \mid \xi \in \widehat{\Pi}_{0,3} \text{ solution of (14) and (15)}\} \subset \mathcal{M}^{!\approx}_{0,3}.$$

In terms of this we can therefore write $\mathcal{M}^{!\approx}_{0,3}$ as a $\frac{1}{2}$ direct product

$$\mathcal{M}^{!\approx}_{0,3} \simeq \mathcal{M}^{!\approx}_{0,3}(0) \cdot \widehat{\Pi}_{0,3}, \tag{26}$$

by writing every element of $\mathcal{M}^{!\approx}_{0,3}$ uniquely as

$$\begin{gathered} \mathrm{int}(f^{-1}) \circ u_0|u_\xi \\ (u_0|u_\xi \in \mathcal{M}^{!\approx}_{0,3}(0) \text{ i.e. } u_0 = u_\xi \text{ with } \xi \text{ solution of (14)(15)}) \\ f \in \widehat{\Pi}_{0,3} \text{ well determined} \end{gathered} \tag{27}$$

These are precisely the [d3] $u_{\xi,f}$ of (19), i.e.,[i1] [illeg. 1]

$$u_{\xi,f} = u_{\alpha,\beta,f} \tag{28}$$

with α, β determined in terms of ξ by

$$\alpha\rho(\alpha)^{-1} = \xi, \quad \beta\sigma_\infty(\beta)^{-1} = \xi\ell_1^{-\nu}, \tag{29}$$

[scan 240]

this is how we can interpret the normalized triples (α, β, f) of corollary 1.

Rescholium (Recapitulation)[i1] The group $\mathcal{N}^{!\widetilde{\approx}}_{0,3} \simeq \mathcal{M}^{!\widetilde{\approx}}_{0,3}(0)$ is in 1-1 correspondence with the set of $\xi \in \widehat{\Pi}_{0,3}$ satisfying the two relations

$$\begin{cases} \xi\rho(\xi)\rho^2(\xi) = 1 & \text{for} \\ \xi = (\widehat{\varphi}(\xi)\sigma_\infty(\widehat{\varphi}(\xi))^{-1})\ell_1^\nu & \nu \in \widehat{\mathbb{Z}} \text{ suitable} \end{cases} \tag{30}$$

or again (putting $\xi = \alpha\rho(\alpha)^{-1}$, $\alpha \in \widehat{\widetilde{\Pi}}_{0,3}$) with the set of $\alpha \in \widehat{\widetilde{\Pi}}_{0,3}$ satisfying the second[i2] relation (30), in which we replace ξ by $\alpha\rho(\alpha)^{-1}$. The element u_ξ of $\mathcal{M}^{!\widetilde{\approx}}_{0,3}(0)$ defined by ξ is defined by the formulas (18), i.e. by

$$u_\xi(\sigma_\infty) = (\xi\ell_1^{-\nu})\sigma_\infty, \qquad u_\xi(\rho) = \xi\rho. \tag{31}$$

Finally, if we have u_ξ and $u_{\xi'}$, then

$$u_{\xi'}u_\xi = u_{\xi''}, \tag{32}$$

where ξ'' is given by the formulas on page 395' (52) — noting that here $\xi = g$, $\xi' = g'$, $\xi'' = g''$: d1

[scan 241]

[p. 421]

d1

$$\xi'' = u'(\xi)\cdot\xi'. \tag{33}$$

Let us now set

$$\mathcal{N}^{\widetilde{\approx}}_{0,3} = \mathcal{G}_3 \times \mathcal{N}^{!\widetilde{\approx}}_{0,3} \subset \mathcal{N}^{\sim}_{0,3} = \mathcal{G}_3 \times \mathcal{N}^{!\sim}_{0,3} \tag{34}$$

and let $\mathcal{M}^{\widetilde{\approx}}_{0,3} \subset \mathcal{M}^{\sim}_{0,3}$ be the inverse image in $\mathcal{M}^{\sim}_{0,3}$ of $\mathcal{N}^{\widetilde{\approx}}_{0,3} \subset \mathcal{N}^{\sim}_{0,3}$, so that we have an extension structure

$$1 \longrightarrow \widehat{\Pi}_{0,3} \longrightarrow \mathcal{M}^{\widetilde{\approx}}_{0,3} \twoheadrightarrow | \longrightarrow \underset{\simeq \mathcal{G}_3\times\mathcal{N}^{!\widetilde{\approx}}_{0,3}}{\mathcal{N}^{\widetilde{\approx}}_{0,3}} \longrightarrow 1 \tag{35}$$

containing the d4subextension[i1] (24) as the inverse image of d5 d6

$$\mathcal{N}^{!\widetilde{\approx}}_{0,3} = \mathrm{Ker}(\mathcal{N}^{\widetilde{\approx}}_{0,3} \longrightarrow \mathcal{G}_3).$$

d7 We have[i2] d8 a further extension structure on $\mathcal{M}^{\widetilde{\approx}}_{0,3}$

$$1 \longrightarrow \widehat{\mathcal{G}}^{+}_{0,3} \longrightarrow \mathcal{M}^{\widetilde{\approx}}_{0,3} \longrightarrow \mathcal{N}^{!\widetilde{\approx}}_{0,3} \longrightarrow 1, \tag{36}$$

containing (24) as a subextension of the same quotient by a smaller group.

The subgroup $\mathcal{M}^{!\approx}_{0,3}(0)$, which is a section of (24), is therefore also a section of (36), hence a canonical isomorphism

$$\mathcal{M}^{\approx}_{0,3} \simeq \underbrace{\mathcal{N}|\mathcal{M}^{!\approx}_{0,3}(0)}_{\simeq \mathcal{N}^{!\approx}_{0,3}} \cdot \widehat{\mathcal{G}}^{+}_{0,3} \tag{37}$$

[scan 243]

[p. 422] Calculation with|of $x = \ell_\infty$.

I am going to return to the determination of the $u_\xi \in \mathcal{M}^{!\sim}_{0,3}[0] = \mathrm{Norm}_{\mathcal{M}^{!\sim}_{0,3}}(L_0)$ which are normalized i.e. which commute with $\widehat{\varphi}$ i.e. satisfy (5) with $\lambda = 1$. For $x = \ell_0$ this formula, by virtue of the particular form of u_ξ, is tautological

$$(\widehat{\varphi} u \ell_0 = \widehat{\varphi}(\ell_0^\mu) = \varepsilon_0^\mu, \quad u\widehat{\varphi}(\ell_0) = u(\varepsilon_0) = \varepsilon_0^\mu),$$

so we want|see that it should come|comes to the same thing to impose it for $x = \ell_1$, or for $x = \ell_\infty$. For $x = \ell_1$, the condition takes the form (10) — remarkable in that it gives a calculation of the|of "delicate" [d1]parameter[i1] β (whose existence au priori|a priori, in terms of ξ, rests on foundations which have not yet been established…), in terms of the "coarse" parameter ξ — taking into account the fact that $i \in \mathbb{Z}/2\mathbb{Z}$[i2] itself is determined just as easily in terms of ξ.

We are going to give this condition a form rather different in appearance, by writing the commutation relation (5) for $x = \ell_\infty$, instead of $x = \ell_1$. Let us first note that we have the relation

$$\tau'_\infty(\rho) = \rho^{-1} \tag{40}$$

For

$$\tau'_\infty(\rho) = \sigma_\infty(\underbrace{\tau_\infty(\rho)}_{\ell_1^{-1}\rho}) = \ell_0^{-1}\,\underbrace{\sigma_\infty(\rho)}_{\underbrace{\sigma_\infty\rho\,\sigma_\infty^{-1}}_{\varepsilon_0}} = \varepsilon_0^{-1}\sigma_\infty^{-1} = \rho^{-1},$$

[scan 244]

it follows that if $u \in \mathcal{M}^{!\sim}_{0,3}$ satisfies

$$u(\rho) = \rho^{\mu|j} \qquad \mu|j \in \mathbb{Z}/3\mathbb{Z} \text{ suitable} \tag{41}$$

then we necessarily have $j \equiv -1$ or $+1$ (3) and if [d1]

$$\alpha_3(j) \in \mathbb{Z}/2\mathbb{Z} \quad \text{characterized by} \quad j \equiv (-1)^{\alpha_3(j)} \ (3) \tag{42}$$

we will therefore have $u(\rho) = \rho$ or $u(\rho) = \rho^{-1}$ according as $\alpha_3(j) = 0$ or $\alpha_3(j) = 1$, and in any case we will have

$$u(\rho) = {\tau'_\infty}^{\alpha_3}(\rho). \tag{43}$$

This being so, let us put $x = \ell_\infty$ in (5):

$$\widehat{\varphi} u(\ell_\infty) = \widehat{\varphi}(\mathrm{int}(f_\infty^{-1})\ell_\infty^{\mu}) = \mathrm{int}(\widehat{\varphi}(f_\infty^{-1}))\rho^{-\mu}$$

(since $\widehat{\varphi}(\ell_\infty) = \rho^{-1}$), and

$$u(\widehat{\varphi}(\ell_\infty)) = u(\rho^{-1}) = u(\rho)^{-1} = \mathrm{int}(\alpha)(\rho^{-1})$$

so formula (5) for $\lambda = 1$ becomes

$$\mathrm{int}(\widehat{\varphi}(f_\infty)\alpha)(\rho^{-1}) = \rho^{-\mu} \qquad \text{i.e.}$$

$$\mathrm{int}(\widehat{\varphi}(f_\infty)\alpha)\rho = \rho^{\mu}$$

and by virtue of (43) [d3]we have[i2] [d4]

$$\rho^{\mu} = {\tau'_\infty}^{\alpha_3 = \alpha_3(\mu)}(\rho) \overset{\text{df|déf}}{=} \mathrm{int}({\tau'_\infty}^{\alpha_3})(\rho)$$

so the condition becomes

$$\mathrm{int}({\tau'_\infty}^{\alpha_3}\widehat{\varphi}(f_\infty)\alpha)\rho = \rho \tag{44}$$

i.e. that the element ${\tau'_\infty}^{\alpha_3}\widehat{\varphi}(f_\infty)\alpha$ of $\widehat{\mathcal{G}}_{0,3} = \widehat{\mathcal{G}}^{+}_{0,3} \cdot \{1, \tau_\infty\}$ commutes with ρ. 243

Scans 245–263

[scan 245]

[p. 423]

m947

Marginal note. m947 one should give its formulas in a precise way, take [illeg. 2]!!!

Now according to the general principles (not yet established, to tell the truth, in the profinite setting) the commutant of ρ in the group in question is reduced to the group generated by ρ, $\{1, \rho, \rho^2\}$, so that the relation (*) takes the form

$$\tau_\infty'^{\alpha_3}\widehat{\varphi}(f_\infty)\alpha = \rho^j \qquad \text{for } j \in \mathbb{Z}/3\mathbb{Z} \text{ suitable} \quad \text{(well determined)}.$$

We make it explicit by using the value of f_∞

$$f_\infty^{-1} = g\rho(g)\rho^2(f_0^{-1}) = g\rho(g) = \rho^2(g)^{-1} = \rho^{-1}(\xi^{-1}),$$

N.B. here $\begin{cases} f_0 = f = 1 \\ g = \xi = \alpha\rho(\alpha)^{-1} \end{cases}$ i1 thus the relation d1 becomes

$$\tau_\infty'^{\alpha_3}\widehat{\varphi}(\rho^{-1}(\xi))\alpha = \rho^j$$

i.e., d2

$$\widehat{\varphi}(\rho^{-1}(\xi)) = \underbrace{\tau_\infty'^{\alpha_3}\rho^j}_{\tau_\infty'^{\alpha_3}(\rho^j)\,\tau_\infty'^{\alpha_3}}\ \alpha^{-1}$$

or also d4 since $\tau_\infty'(\rho) = \rho^{-1}$ thus $\tau_\infty'^{\alpha_3}(\rho^j) = \rho^{(-1)^{\alpha_3}j} = \rho^{j'}$

$$\widehat{\varphi}(\rho^{-1}(\xi)) = \rho^{j'}\tau_\infty'^{\alpha_3}\alpha^{-1} \tag{44}$$

where $\alpha_3 = \alpha_3(\mu) \in \mathbb{Z}/2\mathbb{Z}$ defined by $(-1)^{\alpha_3} \equiv \mu$ (3) and $j' \in \mathbb{Z}/3\mathbb{Z}$ (well determined).

We shall transform this relation a little further, by writing

$$\tau_\infty'^{\alpha_3} = (\sigma_\infty\tau_\infty)^{\alpha_3} = \sigma_\infty^{\alpha_3}\tau_\infty^{\alpha_3} \qquad \text{whence}$$

$$\tau_\infty'^{\alpha_3}\alpha^{-1} = \sigma_\infty^{\alpha_3}\underbrace{(\alpha\tau_\infty^{\alpha_3})}_{\widetilde{\alpha}}{}^{-1} \tag{*}$$

[p. 244]

[scan 246]

where [d1]

$$\tilde{\alpha} = \alpha\tau_\infty^{\alpha_3} \qquad (45)$$

has the advantage over α itself of being in $\widehat{\Pi}_{0,3}$ in all cases (N.B. we have $\alpha \in \widehat{\Pi}_{0,3} \cdot \{1, \tau_\infty\}$, and $\alpha \in \widehat{\Pi}_{0,3}$ iff $\alpha_3 = 0$). It is equal to α iff $\alpha_3 = 0$ and in the case $\alpha_3 = 1$ [d3] is directly related to ξ by the formula

$$\xi = \tilde{\alpha}\ell_1^{-1}\rho(\tilde{\alpha})^{-1} \qquad (46)$$

(deduced from (45), from $\xi = \alpha\rho(\alpha)^{-1}$, and from

$$\tau_\infty\rho(\tau_\infty)^{-1} = \ell_1^{-1} \qquad (**)$$

). Thus (44) takes the definitive form

$$\boxed{\widehat{\varphi}(\rho^{-1}(\xi)) = \rho^{j'}\sigma_\infty^{\alpha_3}\{\tilde{\alpha}^{-1}} \qquad (\tilde{\alpha} = \alpha\tau_\infty^{\alpha_3}) \qquad (47)$$

m948

Marginal note. [m948] all the factors of this formula are defined in $\widehat{\mathcal{G}}^+_{0,3}|\widetilde{\mathcal{G}}^+_{0,3}$, i.e. of multiplier +1

which can also|thus be written|describe, on passing to inverses

$$\widehat{\varphi}(\rho^{-1}(\xi^{-1})) = \tilde{\alpha}\sigma_\infty^{\alpha_3}\rho^{-j'} \qquad (47\text{ bis})$$

or again, solving for $\tilde{\alpha}$

$$\underset{\alpha\tau_\infty^{\alpha_3}}{\tilde{\alpha}} = \widehat{\varphi}(\rho^{-1}(\xi^{-1}))\rho^{j'}\sigma_\infty^{\alpha_3}. \qquad (48)$$

We shall compare this formula with formula (10), which is solved for β in the form

$$\widehat{\varphi}(\xi) = \beta\sigma_\infty^i \qquad (49)=(10)$$

$$\beta = \widehat{\varphi}(\xi)\sigma_\infty^i \qquad (50)$$

[scan 247]

[p. 424]

The fact that formula (47) is indeed equivalent to (10), or again to (49), when $\alpha \in \widehat{\widetilde{\Pi}}_{0,3}|\widetilde{\widehat{\Pi}}_{0,3}$ and $\beta \in \widehat{\Pi}_{0,3}$ are related by $\xi = \eta\ell_1^\nu$ (where $\xi = \alpha\rho(\alpha)^{-1}$, $\eta = \beta\sigma_\infty(\eta)^{-1}$), would deserve a direct verification. The interest of (47), or of [d1] its form solved for α (48), just as of (10)$=$ (49)[i1] or (50), consists in the fact that these formulas give the "delicate" parametersα, β[i2], in terms of the "coarse parameter" ξ. Both are formulas in $\widehat{\mathcal{G}}^+_{0,3}$ — on reducing modulo $\widehat{\Pi}_{0,3}$, they give formulas in $\mathfrak{S}_3|\mathcal{S}_3$, namely (taking into account that $\tilde{\alpha}, \beta \in \widehat{\Pi}_{0,3}$): [d2]

$$\begin{cases} \widehat{\varphi}\,(\rho^{-1}(\xi)) = \dot{\rho}^{j'}\dot{\sigma}_\infty^{\alpha_3} \\ \widehat{\varphi}\,(\xi) = \dot{\sigma}_\infty^{i} \end{cases} \tag{51}$$

which gives back|gives exactly [d3], in terms of the elements $\widehat{\varphi}\,(\xi)$ and $\widehat{\varphi}\,(\rho^{-1}(\xi))$ of $\mathfrak{S}_3|\mathcal{S}_3$, the values of $i, \alpha_3 \in \mathbb{Z}/2\mathbb{Z}$ and of $j' \in \mathbb{Z}/3\mathbb{Z}$. (We should see whether i, j' can, like α_3, be made explicit in terms of the multiplier μ, or even in terms of its [m949]

Marginal note. [m949] and also see whether (i, α_3, j') can take all sorts of values in $\mathbb{Z}/2 \times \mathbb{Z}/2 \times \mathbb{Z}/3$

[scan 248]

quadratic residues $\varepsilon_\ell(\mu)$) We can supplement them with a formula deduced from one and [d1] the other, taking into account that

$$\xi\rho(\xi)\underbrace{\rho^2(\xi)}_{\rho^{-1}(\xi)} = 1 \qquad \text{i.e.} \qquad \rho^{-1}(\xi)\xi = \rho(\xi)^{-1}$$

we therefore find, multiplying (47) and (10)

$$\widehat{\varphi}(\underbrace{\rho^{-1}(\xi)\cdot\xi}_{\rho(\xi)^{-1}}) = \rho^{j'}\sigma_\infty^{\alpha_3}\tilde{\alpha}^{-1}\beta\sigma_\infty^{i}$$

i.e. again

$$\widehat{\varphi}(\rho(\xi)) = \sigma_\infty^{i}(\beta^{-1}\tilde{\alpha})\sigma_\infty^{\alpha_3}\rho^{-j'} \tag{52}$$

i.e., in the form solved for $\beta^{-1}\tilde{\alpha}$

$$\underbrace{\beta^{-1}\tilde{\alpha}}_{(\beta^{-1}\alpha)\tau_\infty^{\alpha_3}} = \sigma_\infty^i \widehat{\varphi}(\rho(\xi))\sigma_\infty^{\alpha_3}\rho^{j'}. \tag{53}$$

We can consider that the three main "delicate parameters" are the quantities β, α and $\beta^{-1}\alpha$, which are expressed directly, in a remarkably simple way, in terms of the values of $\widehat{\varphi}$ for ξ, $\rho^{-1}(\xi)$ and $\rho^{-1}|\rho^{-2}(\xi) = \rho(\xi)$, which would dispense [d3] probably (by [p. 247]

[scan 249]

[p. 425]

carrying out the calculations in terms of ξ, η exclusively, which would require a little more effort...) with appealing to delicate results not yet proved, of the type $\xi = \alpha\rho(\alpha)^{-1}$, $\eta = \beta\sigma_\infty(\beta)^{-1}$,[i1] to justify the introduction of these parameters α, β. (recapitulation)

$$\begin{cases} \widehat{\varphi}(\xi) = \beta\sigma_\infty^i \\ \widehat{\varphi}(\rho^{-1}(\xi)) = \rho^{j'}\sigma_\infty^{\alpha_3}\tilde{\alpha}^{-1} \qquad (\tilde{\alpha} = \alpha\tau_\infty^{\alpha_3}) \\ \widehat{\varphi}(\underbrace{\rho^{-2|-1}(\xi)}_{\rho(\xi)}) = \underbrace{\sigma_\infty^i(\beta^{-1}\tilde{\alpha})\sigma_\infty^{\alpha_3}}_{\sigma_\infty^i(\beta^{-1}\tilde{\alpha})\sigma_\infty^{\alpha_3+i}\rho^{-j'}} \rho^{-j'} \end{cases} \tag{54}$$

Suppose for simplicity

$$\alpha_3 = 0 \quad \text{i.e.} \quad \alpha = \tilde{\alpha} \quad \text{i.e.} \quad \alpha \in \widehat{\Pi}_{0,3} \tag{55}$$

Then we obtain from the second formula (54), taking inverses

$$\widehat{\varphi}(\rho^{-1}(\xi^{-1})) = \alpha\rho^{-j'}$$

and the $x\rho(x)^{-1}$ of both sides

$$\xi = \widehat{\varphi}(\rho^{-1}(\xi^{-1}))\rho\Big(\widehat{\varphi}(\rho^{-1}(\xi^{-1}))\Big)^{-1} \tag{56}$$

which already implies the first formula (14) in the fundamental formulas (14) (15). [p. 248]

Apparatus for this scan

140-3-s249-I001 *insertion. Manuscript:* of the type $\xi = \alpha\rho(\alpha)^{-1}$, $\eta = \beta\sigma_\infty(\beta)^{-1}$,

[p. 426]

with

$$(60) \qquad i = 1, \quad \alpha_3 = 1 \quad \text{i.e.} \quad \varepsilon_3 = -1, \quad j' = -1$$

Remark We can ask the question, in general, of determining the elements $u_{\alpha,\beta} = u_{\xi,\eta}$ of $\mathcal{M}^{!\sim}_{0,3}[0]$ (not necessarily normalized in one sense or the other) such that we have (of course by hypothesis, $f = 1$; but also) [d1] $\beta = 1$ i.e. $\eta = 1$, [d2] [d3] (N.B. We already know that if $\alpha = 1$ i.e. $\xi = 1$, then $u = 1$) We shall have to have $\xi = \eta\ell_1^\nu = \ell_1^\nu$, and it remains to check [d4]

$$\xi\rho(\xi)\rho^2(\xi) = 1 \quad \text{with} \quad \xi = \ell_1^\nu,$$

$\mathrm{Sl}(2, \widehat{\mathbb{Z}})'$, [d5] so that

$$\underline{\xi} = \begin{pmatrix} 1 & 0 \\ 2\nu & 1 \end{pmatrix}$$

this means (page 344|342)[i1] that we have either

$$\underline{\xi} = \pm\underline{\rho}^{-1}. \quad = \pm \begin{pmatrix} -1 & 1 \\ 1 & 0 \end{pmatrix}$$

– which is clearly not the case – or

$$C + D - B = \pm 1 \quad \text{i.e.} \quad 2\nu + 1 = \mu = \pm 1 \quad \text{i.e.}$$

$\nu = 0$ or -1 – these are the two trivial cases $u_\xi = \mathrm{id}$ and $u_\xi = \tau_\infty$.
m954

Marginal note. [m954] We are needlessly repeating arguments already made, we know very well that the multiplier is (up to sign when the normalization of ξ has not been done) equal to one of the "coefficients [illeg. 1]" of ξ, hence equal to ± 1.

Let us note the|the

Proposition. The commutant of τ (the nontrivial element of $\mathcal{T}^{!}_{0,3} \simeq \mathbb{Z}/2\mathbb{Z} \subset \mathcal{N}^{!\sim}_{0,3}|\mathcal{M}^{!\sim}_{0,3}$) in $\mathcal{N}^{!\sim}_{0,3}$ is reduced to $\{1, \tau\}$.
m955

Marginal note. m955 N.B. This proposition [illeg. 3] in § 46 VI|II, [illeg. 4] of [illeg. 2] of $\widehat{\Gamma}$.

We shall do the calculation in the isomorphic group $\mathcal{M}^{!\sim}_{0,3}(0)$, where τ corresponds to τ_∞ i1, in fact it turns out that the centralizer of τ in the whole of $\mathcal{M}^{!\sim}_{0,3}[0]$ (the big normalizer of L_0 in $\mathcal{M}^{!\sim}_{0,3}$, formed of the u_ξ without normalization conditions) is reduced to $\{1, \tau\}$. Indeed, we must express the commutation of a $u = u_\xi$ with $u_{\xi'} = \tau_\infty$, where $\xi' = \ell_1^{-1}$, we have

$$\begin{cases} u_{\xi'} u_\xi = u_{\xi''} & \text{with } \xi'' = \dot{u}_{\xi'}(\xi)\xi' \\ u_\xi u_{\xi'} = u_{\xi'''} & \text{with } \xi''' = \dot{u}|u_\xi(\xi')\xi \end{cases}$$

and we must express $\xi'' = \xi'''$, i.e.

$$\tau_\infty(\xi)\ell_1^{-1} = u_\xi(\ell_1^{-1})\xi. \tag{61}$$

Now we have

$$\dot{u}|u_\xi(\varepsilon_1) = \mathrm{int}(\xi)(\varepsilon_1^\mu) \qquad \text{whence}$$
$$\dot{u}|u_\xi(\underbrace{\ell_1^{-1}}_{\varepsilon_1^{-2}}) = \mathrm{int}(\xi)(\ell_1^{-\mu})$$

and (61) is written

$$\tau_\infty(\xi)\ell_1^{-1} = \xi\ell_1^{-\mu} \qquad \text{i.e.}$$
$$\xi^{-1}\tau_\infty(\xi) = \ell_1^{1-\mu} = \ell_1^{-2\nu}. \tag{62}$$

[p. 251]

Apparatus for this scan

140-3-s252-I001 *insertion. Manuscript:* where τ corresponds to τ_∞
Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

[p. 427]

This equation has the solution

$$(63) \qquad \xi = \ell_1^{\nu}$$

in $\widehat{\Pi}_{0,3}$ (for $\tau_\infty(\ell_1) = \ell_1^{-1}$ hence $\tau_\infty(\xi) = \ell_1^{-\nu}$) and this solution is unique if|once we admit that the discrete results extend to the profinite case, so as to have

$$(64) \qquad (\widehat{\Pi}_{0,3})^{\tau_\infty} = \{1\}.$$

Now ξ must moreover satisfy the relation

$$\xi\rho(\xi)\rho^2(\xi) = 1$$

and we have just seen that this implies $\nu = \pm 1$, i.e. $\dot{u}|u \in \{\mathrm{id}|1, \tau_\infty\}$. [p. 252]

[scan 254]

[p. 428]

48. Construction of a group scheme.

I) Study of the map $\alpha \longmapsto \alpha\rho(\alpha)^{-1} = [\alpha, \rho]$.

Let|Let G be a group scheme over a ring A (for example $A = \mathbb{Z}$, $G = \mathrm{Sl}(2)_{\mathbb{Z}}$ or $\mathrm{Gl}(2)_{\mathbb{Z}}$), ρ a section of G, and let us consider the morphism

$$(1) \qquad F_\rho : \ \alpha \longmapsto \alpha\rho(\alpha)^{-1} = [\alpha, \rho] : \qquad G \longrightarrow G.$$

Let

$$T_\rho = \mathrm{Centr}_G(\rho) = G^\rho \subset G$$

then

$$(2) \qquad F_\rho(\alpha') = F_\rho(\alpha) \quad \Longleftrightarrow \quad \alpha' \text{ section of } \alpha T_\rho$$

thus[i2] we have a canonical monomorphism induced by F_ρ[i3]

$$(3) \qquad G/T_\rho \hookrightarrow G,$$

whose image is to be characterized.

In the case that concerns us, the quotient group G_{ab} is representable (it is the trivial group for $G = \mathrm{Sl}(2)_{\mathbb{Z}}$, and it is $\mathbb{G}_m$ if $G = \mathrm{Gl}(2)_{\mathbb{Z}}$), [d5]In any case,[i4] a first condition for a section $\xi \in G(S)$[i5] over an AScheme S, [d6] for it to be in the image, is that we have

$$(4) \qquad \delta(\xi) = 1$$

$$(5) \qquad \delta : G \longrightarrow G_{\mathrm{ab}}$$

is the canonical homomorphism. A second condition is that $\xi\rho$, which must be (locally) of the form $\alpha\rho\alpha^{-1}$, be conjugate locally to ρ – and this condition is moreover necessary and sufficient, tautologically, for ξ to belong to the image of F_ρ, and thus implies condition (4). But the latter may sometimes serve as an ingredient, [d1] in a [illeg. 1] of conditions of a "computational" nature, which are necessary and sufficient for us to have $\xi\rho \sim \rho$.

In the case of a reductive group G, the condition of [d2]conjugation[i1] locally[i2] of sections is moreover fairly well understood, since in particular the work of Steinberg. We have a "scheme of invariants" I_G, and a canonical morphism

$$(6) \qquad G \longrightarrow I_G$$

(which is universal (over A, and also after every base change)[i3] for morphisms from G into schemes, which are invariant under inner automorphisms – i.e. I_G is the representable envelope of $G/\mathrm{int}(G)$ sheaf of conjugacy [p. 254]

[p. 429] classes.

$$(7) \qquad G/\mathrm{int}(G) \longrightarrow I_G.$$

To tell the truth, [d1] this morphism is an epimorphism (for the|the fppf topology), but not an isomorphism i.e. not a monomorphism – in other words, for two sections (in this case ρ, $\xi\rho$) of G, it is indeed necessary, but not always sufficient, that their images in I_G be equal, for them to be conjugate locally^t fppf. But in the case where the two sections are -regular in the sense of Steinberg (which is a condition on each fiber) [d3]the condition is[i1] sufficient. It is also so if the two sections are $\frac{1}{2}$ simple (which is also a condition on each fiber).

In the case of a group locally isomorphic to Sl(2), to GP(1),[i2] or Gl(2), the regular sections in the sense of Steinberg are moreover those which are central at no point – which is indeed the case for the ρ or the $\sigma_\infty = \sigma$ of the preceding §On the other hand, I_G is then well known, [d4] [p. 255]

[p. 430] Corollary When these conditions are satisfied, the scheme of solutions in α[i1] of the equation

$$[\alpha, \rho] = \xi$$

is a (right) torsor under T_ρ, which is a smooth commutative group scheme over S, of relative dimension 1 (if G a form of Sl(2)) or 2 (if G a form of Gl(2)|Sl(2)).

Examples $G = \mathrm{Gl}(2)_{\mathbb{Z}}$, $\rho = \begin{pmatrix} 0 & 1 \\ -1 & 1 \end{pmatrix}$ is the element of $\mathrm{Sl}(2,\mathbb{Z})$ already so denoted (starting from page 335). It is indeed regular, [d2] likewise the element $\sigma = \sigma_\infty = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}$.

In general, the datum of a form of Gl(2) is equivalent to that of a form of Sl(2), or of GP(1), or again to that of an Azumaya Algebra of rank 4 over S, let M be one – i.e. an Algebra locally (fppf)[i2] isomorphic to $M_2(\mathcal{O}_S)$ – by

$$(9) \qquad \begin{cases} \mathbb{G}|G(M) &= \text{scheme of units of } M \\ S\mathbb{G}|G(M) &= \text{——————————} \quad \text{of determinant 1} \\ P\mathbb{G}|G(M) &= S\mathbb{G}|G(M)/\text{Centre} \simeq \mathbb{G}|G(M)/\mathbb{G}_m|G_m \end{cases}$$

Thus|In the datum [d3] corresponds to that of an invertible section of M, and [p. 257]

[scan 259]

the regularity condition means that the subalgebra generated on each fiber is of rank 2 (and not reduced to the scalars)[i1] – which implies that ρ generates [d1]a|unique sub[i2]-algebra of degree two

$$(10) \qquad \mathcal{O}_S + \mathcal{O}_S\rho = A_\rho$$

which is locally a direct summand in M as a module, i.e. with formation commuting|commuting with base change … And we shall have

$$(11) \qquad \begin{array}{c} T_\rho = \text{scheme of units of } A_\rho \\ (\text{case of } G = \mathbb{G}|G(M)) \end{array}$$

or

$$(11\text{bis}) \qquad \begin{array}{c} T_\rho = \text{scheme of units of } A_\rho \\ \text{of } \underline{\text{norm}} \text{ equal to } 1 \\ (\text{case of } G = S\mathbb{G}|G(M)) \end{array}$$

We shall note that T_ρ is a <u>torus</u> (necessarily maximal)[i3] iff ρ is $\frac{1}{2}$ simple, i.e. $\frac{1}{2}$ simple in each fiber – which is equivalent, since it is regular, to the fact that in each fiber its two eigenvalues are distinct. For

$$(12) \qquad \rho = \begin{pmatrix} 0 & 1 \\ -1 & 0|1 \end{pmatrix} \qquad (\rho^6 = 1,\ \rho^3 = -1)$$

this is [d2] the case in characteristic $\neq 3$ – thus in the|in the strict sense T_ρ (as a group scheme over $\operatorname{Spec}\mathbb{Z}$) is <u>not</u> a torus – it [p. 258]

[scan 260]

[p. 431]

becomes [d1] a product of a[i1] unipotent with the center $\mathbb{G}_m|G_m$ in characteristic 3. Likewise, for

$$\sigma = \sigma_\infty = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}, \qquad \sigma_\infty^4 = 1, \quad \sigma^2 = -1, \tag{13}$$

σ is $\frac{1}{2}$ simple in all characteristics except in characteristic 2, where it is unipotent – and T_σ is a torus except in characteristic 2, where it [d2] is a product of the center[i2] $\mathbb{G}_m|G_m$ with a unipotent.

Let us return to the general case

When we take the centralizer in $S\mathbb{G}|G(M)$, we find

$$ST_\rho \subset T_\rho, \qquad ST_\rho = \operatorname{Ker}\left(T_\rho \xrightarrow[\substack{\text{is induced|induced} \\ \text{by the determinant}}]{\text{norm}} \mathbb{G}_m|G_m \right) \tag{13}$$

The advantage of the T_ρ over ST_ρ is that every torsor under T_ρ = scheme of units of A_ρ is locally trivial in the Zariski sense, whereas this is no longer necessarily so for a torsor under ST_ρ. Thus, when we set out to solve the equation in α

$$[\alpha, \rho] = \xi,$$

for given ξ satisfying the conditions of the proposition, this is possible (Zariski locally) in $\mathbb{G}|G(M)$, but perhaps not in $S\mathbb{G}|G(M)$.

Let us return to the special case

$$\rho = \begin{pmatrix} 0 & 1 \\ -1 & 1 \end{pmatrix}, \qquad A = \mathbb{Z}$$

then

$$\begin{gathered} A_\rho = \text{ring of integers of the field} \\ \mathbb{Q}(\sqrt[3]{-1}), \quad \rho \text{ corresponds to} \\ \exp(2i\pi/6) = \frac{1 + i\sqrt{3}}{2} \end{gathered} \tag{14}$$

When we give ourselves ξ, [d1]

$$\xi = \begin{pmatrix} A & B \\ C & D \end{pmatrix}, \quad \text{whence } \xi\rho = \begin{pmatrix} -B & A+B \\ -D & C+D \end{pmatrix}$$

the conditions [d3] b), c) of the proposition [d4]

$$\det \xi = 1, \quad \operatorname{Tr}(\xi\rho) = \operatorname{Tr} \rho$$

[d5] become

$$AD - BC = 1 \qquad C + D - B = 1 \tag{16}$$

– quite familiar conditions! They imply the possibility [d6] (over an arbitrary scheme) of finding Zariski locally an $\alpha \in \Gamma\mathrm{Gl}(2)$ such that [d7]

$$\alpha\rho(\alpha)^{-1} = [\alpha, \rho] = \xi, \tag{*}$$

m958

Marginal note. [m958] at least if we suppose that the condition of regularity is not violated on any fiber…

and over $\mathbb{Z}$ it is even possible globally, for the obstruction is an [d8] invertible A_ρ-Module, now[i1] A_ρ is principal unless I am mistaken i.e. [d10]

$$\operatorname{Pic}(A_\rho) = 1 \tag{17}$$

[scan 262]

[p. 432]

But if α is a solution, we shall have a priori

$$\det \alpha \in \mathbb{Z}^* = \{\pm 1\} \tag{18}$$

and [d1] other solution will be of the form $\alpha' = \alpha f$, with $f \in A_\rho^*$, whence

$$\det \alpha' = \det \alpha \cdot \det f = \det \alpha$$

for

$$\det f = f\bar{f} > 0 \quad \text{hence} \quad \det f = +1,$$

thus the sign in (18) [d2] does not depend on the choice of α – if it is -1, one cannot find a solution of equation (*) in $\mathrm{Sl}(2, \mathbb{Z})$. The sign depends only on ξ i.e. only on A, B, C, D – and in fact [d3] only on B, D (which already determine ξ, thanks to formulas (16) at least if D invertible[i1]) – the computations made elsewhere suggest that this sign is also [d4] equal to the remainder of D mod 3 – 1 if $D \equiv 1$ (3), -1 if $D \equiv -1$ (3).

Returning to the general case, if we have found a relation

$$[\alpha, \rho] = \alpha\rho(\alpha)^{-1} = \xi \qquad \alpha \in \Gamma\mathbb{G}|G(M), \tag{19}$$

in order [d5] to find a solution α' which is $\in \Gamma S\mathbb{G}|G(M)$ i.e. $\det \alpha' = 1$, we know that the solutions $\alpha' \in \Gamma\mathbb{G}|G(M)$ [d6] are given by

$$\alpha' = \alpha f \qquad f \in \Gamma\underline{\mathcal{O}}_S^*,$$

and the condition becomes

$$\det \alpha' = 1 \quad \text{i.e.} \quad \det(\alpha f) = 1 \quad \text{i.e.}$$

$$\det(f^{-1}) = \det \alpha$$

thus the necessary and sufficient condition for the existence of a solution is that the section $\det \alpha$ of $\mathcal{O}_S^*$ be in the image of the norm homomorphism

$$N|\mathcal{N}_{A_\rho/A} : A_\rho^* \longrightarrow A^*, \tag{20}$$

i.e. the obstruction is in the group

N.B. $S = \operatorname{Spec} A$

$$A^*/N|\mathcal{N}_{A_\rho/A} A_\rho^* \tag{21}$$

which is a particularly well-known invariant in class field theory!

N.B. $N(c\rho + d) = c^2 + cd + d^2$

Unless I am mistaken, it follows from class field theory that for ρ given by (12), and for $A = \underbrace{\mathbb{Z}_\ell}_{\text{integers } \ell\text{-adic}}$ (ℓ a prime number), this quotient group is zero in all cases, except for $\ell = 3$, where it is isomorphic to $\mathbb{Z}/2\mathbb{Z}$. d2

arbitrary base|Ring

Let us note that (still in the special case (12)) if

$$\alpha = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \tag{22}$$

Scans 264–282

[scan 264]

[p. 433]

$$(ad - bc)D = (c^2 + cd + d^2) \tag{23}$$

thus D is invertible iff $c^2 + cd|d + d^2 = \mathcal{N}_{A_\rho/A}(c\rho + d)$ is i.e. iff $c\rho + d$ is invertible, and then

$$ad - bc = (c^2 + cd + d^2)/D$$

which shows that the sign of $\det \alpha = ad - bc$ is then equal to the value of D mod 3.

for $c^2 + cd + d^2 \equiv 1$ (3)

(But can D be equal to 0 mod 3? then mod 3 the matrix ξ [d1] would depend only on the parameters A, B

$$\xi = \begin{pmatrix} A & B \\ 1+B & 0 \end{pmatrix}$$

with $-B(1+B) = 1$ i.e. $B^2 + B + 1 = 0$[i1] [d2] thus $B^3 = 1$ thus (since 3) $B = 1$[i2] thus we will have $\xi = \begin{pmatrix} A & 1 \\ -1 & 0 \end{pmatrix}$, [d3]

$$\xi\rho = \begin{pmatrix} -1 & A+1 \\ 0 & -1 \end{pmatrix},$$

this matrix is regular iff $A \neq -1$, OK.)|} Thus a priori we cannot exclude the case where D can take a zero value mod 3…)

When we take the section σ of $\mathrm{Sl}(2)_{\mathbb{Z}}|\mathrm{Gl}(2)_{\mathbb{Z}}$, given by

$$\sigma = \sigma_\infty = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix} \qquad \sigma_\infty^4 = 1, \quad \sigma_\infty^2 = -1 \tag{24}$$

we again have (unless I am mistaken)

$$\mathrm{Pic}(A_\sigma) = 0|1. \tag{25}$$

case|for $A = \mathbb{Z}$.

The numerical condition on

$$\eta = \begin{pmatrix} R & S \\ T & U \end{pmatrix} \tag{26}$$

to [d4] be locally in the image

[scan 265]

of F_σ (in addition to the regularity condition on $\eta\sigma$)

$$\eta = \beta\sigma(\beta)^{-1} = [\beta, \sigma] \tag{27}$$

is that we have

$$\det \eta = 1, \quad \mathrm{Tr}(\eta\sigma) = \mathrm{Tr}\sigma \tag{28}$$

now

$$\eta\sigma = \begin{pmatrix} R & S \\ T & U \end{pmatrix}\begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix} = \begin{pmatrix} S & -R \\ U & -T \end{pmatrix}$$

and (28) becomes

$$RU - ST = 1, \quad S - T = 0 \quad \text{i.e. } S = T \tag{29}$$

i.e. η must be symmetric. [d1] If this condition is satisfied, it follows from (25) — when the base is $\mathbb{Z}$ — that we can find a solution $\beta \in \mathrm{Gl}(2,\mathbb{Z})$ of (27), the obstruction to finding a solution in $\mathrm{Sl}(2,\mathbb{Z})$ is again a sign, namely an element in

$$\mathbb{Z}^*/\mathcal{N}(A_\sigma^*) \simeq \pm 1$$

— as we have, for

$$\beta = \begin{pmatrix} r & s \\ t & u \end{pmatrix}. \tag{30}$$

[d2] satisfying (27), the relation

$$(rt - su)U = t^2 + u^2 = \mathcal{N}(t\sigma + u) \tag{31}$$

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 266]

[p. 434]

we see as before that U is invertible iff $t\sigma + u$ is i.e. $t^2 + u^2$ is, and that in this case, the obstruction [d1] (base $\mathbb{Z}$, or $\mathbb{Z}_\ell$) is the residue of U mod 4 (which is equal to ± 1)…

(arbitrary base)

Let us summarize for reference

for $t^2 + u^2 \equiv 1$ (4)

Proposition. Let $A = \mathbb{Z}$, or $\mathbb{Z}_\ell$, or $\widehat{\mathbb{Z}}$, and let us consider the two[i1] equations [d2]

$$\begin{cases} [\alpha, \rho] \overset{\text{déf}}{=} \alpha\rho(\alpha)^{-1} = \xi \\ [\beta, \sigma] = \beta\sigma(\beta)^{-1} = \eta \end{cases}$$

where $\rho = \begin{pmatrix} 0 & 1 \\ -1 & 1 \end{pmatrix}$, $\sigma = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}$, ξ and $\eta \in \mathrm{Gl}(2,A)$ given, with unknowns α resp. β in $\mathrm{Gl}(2,A)$. We assume that

$$\xi = \begin{pmatrix} A & B \\ C & D \end{pmatrix} \quad \text{resp. } \eta = \begin{pmatrix} R & S \\ T & U \end{pmatrix}$$

satisfy the necessary[i2] numerical conditions for the existence of a solution

$$AD - BC = 1 \qquad B + D - C = 1 \tag{16}$$

$$RU - ST = 1 \qquad S - T = 0 \quad \text{i.e. } S = T. \tag{29}$$

Then:

1) For there to be a solution α (resp. β)[i3] in $\mathrm{Gl}(2,A)$, it is necessary|necessary and sufficient that $\xi\rho = \begin{pmatrix} -B & A+B \\ -D & C+D \end{pmatrix}$ be regular, i.e. nonscalar on each fiber (resp. that $\eta\sigma = \begin{pmatrix} S & -R \\ U & -T = -S \end{pmatrix}$ be so) — [d3]

[scan 267]

[d1] i.e. that on no fiber, ξ (resp. η) be a scalar multiple of ρ^{-1} (resp. σ^{-1}) — and for this it suffices that D (resp. U) be invertible (since the [d2] corresponding in|of

$$\rho^{-1} = \begin{pmatrix} 1 & -1 \\ 1 & 0 \end{pmatrix} \quad \text{or} \quad \sigma^{-1} = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix}$$

is zero).

2) When D (resp. U) is invertible, there is always a solution α resp. β, with $\det \alpha \in \pm 1$ (resp. $\det \beta \in \{\pm 1\}$).

3) For there to be a solution in $\mathrm{Sl}(2, A)$, it is necessary and sufficient that we have $D \equiv 1$ (3) (resp. $U \equiv 1$ (4)) — a condition which is automatic if $A = \mathbb{Z}_\ell$ with $\ell \neq 3$ (resp. with $\ell \neq 2$).

II) Study in Gl(2) of the equation

$$[\alpha, \rho] = [\beta, \sigma]\varepsilon_1(\mu - 1). \tag{32}$$

Study first of the equation in ξ, η.

We always assume that G is a form of Gl(2), associated with an Azumaya algebra $\mathcal{M}$ over the base $S = \operatorname{Spec} A$, and that we have two regular sections ρ, σ of G i.e. two invertible sections of $\mathcal{M}$. We are also given a "1-parameter subgroup" (additive) of G, i.e. a homomorphism

$$\varepsilon_1 : \mathbf{G}_a \longrightarrow \mathrm{S}G, \qquad \lambda \longmapsto \varepsilon_1(\lambda). \tag{33}$$

[scan 268]

[p. 435]

The case which interests us more particularly is that where $G = \mathrm{Gl}(2)_{\mathbb{Z}}$, ρ and σ as above, and

$$\varepsilon_1(\lambda) = \varepsilon_1^{\lambda} = \begin{pmatrix} 1 & 0 \\ \lambda & 1 \end{pmatrix}. \tag{34}$$

We will note that here

$$\varepsilon_1 = \varepsilon_1(1) = \begin{pmatrix} 1 & 0 \\ 1 & 1 \end{pmatrix} = \rho\sigma \tag{35}$$

We regard (32) as equations relating the quantities α, β, μ — α, β variable local[i1] sections of G, μ a section of $\mathbb{E}^1|\mathbf{E}^1$ — the hypotheses we are going to make imply|will imply moreover that μ will in fact be a section of $\mathbf{G}_m$ (if, together with α, β, it satisfies relation (32)). [d2]

We will begin by studying the systems [d3] $(\xi, \eta, \mu|\beta)$ satisfying

$$\begin{cases} \xi = \eta\varepsilon_1(\mu - 1) & (33) \\ \det\xi = \det\eta = 1 & (34) \\ \mathrm{Tr}\xi\rho = \underbrace{\mathrm{Tr}\rho}_{\|_i} \text{ and } \quad \mathrm{Tr}\eta\sigma = \underbrace{\mathrm{Tr}\sigma}_{\|_j} & (35) \end{cases}$$

m968

Marginal note. [m968] N.B. We will have $\det\varepsilon_1(\mu - 1) = 1$ thus $\det\xi = \det\eta$, by the first relation.

We can eliminate η from these equations, thanks to (33), we find

$$(36) \qquad \det \xi = 1, \qquad \mathrm{Tr}(\xi - 1)\rho = 0, \qquad \mathrm{Tr}(\xi\varepsilon_1(1-\mu)\dagger - 1)\sigma = 0.$$

d4

The third relation (36), on expanding with respect to the coefficients of ξ, [d5] can be written

$$(37) \qquad P(\xi)\mu - |+Q(\xi) = 0$$

where the coefficients P, Q are affine linear functions with respect to those of ξ, [d6] give rise to the identity (in ξ, μ)

$$(38) \qquad (\mathrm{Tr}(\xi\varepsilon_1(1-\mu)\dagger - 1)\sigma\dagger) = P(\xi)\mu - Q(\xi)$$

d10

The constant term $-Q(\xi)$ being [d11] identically[i7] equal to[i8] the value of the left-hand side of (38) for $\mu = 0$, i.e.

$$(39) \qquad \begin{aligned} -Q(\xi) &= \mathrm{Tr}((\xi\varepsilon_1 - 1)\sigma). \\ &= \mathrm{Tr}\,\xi(\varepsilon_1\sigma) - \mathrm{Tr}\,\sigma \end{aligned}$$

We assume that we have

$$(40) \qquad \varepsilon_1\sigma = -\lambda_0\rho \qquad \begin{array}{l} \lambda \text{ central section of } G \\ \text{i.e. } \lambda \text{ invertible scalar} \end{array}$$

so that

$$(40 \text{ bis}) \qquad \boxed{\varepsilon_1 = -\lambda_0\rho\sigma^{-1}}$$

m969

Marginal note. [m969] N.B. If $\det\rho = \det\sigma = 1$, then we must have $\lambda_0^2 = 1$ thus if A integral, $\lambda_0 \in \{\pm 1\}$.

and (39) becomes, by virtue [d12]

$$\mathrm{Tr}\,\xi(\varepsilon_1\sigma) = -\lambda_0|\lambda_0\,\mathrm{Tr}\,\xi\rho \overset{\text{by (36)}}{=} -\lambda_0\,\mathrm{Tr}\,\rho, \quad \text{thus}$$

[scan 270]

[p. 436]

we find

$$(41) \qquad Q(\xi) = \underbrace{\lambda_0 \operatorname{Tr}\rho + \operatorname{Tr}\sigma}_{c} \qquad \text{(constant, independent of } \xi\text{)}$$

and we assume

$$(42) \qquad c = \lambda_0 \operatorname{Tr}\rho + \operatorname{Tr}\sigma \quad \text{section invertible of } \mathcal{O}_S.$$

(In the case which interests us, we will have

$$\sigma^{-1} = -\sigma, \quad \varepsilon_1 = \rho\sigma = -\rho\sigma^{-1}, \quad \text{i.e. } \lambda_0 = 1$$

$$c = \lambda_0 \underbrace{\operatorname{Tr}\rho}_{1} + \underbrace{\operatorname{Tr}\sigma}_{0} = 1 \qquad \text{OK.}$$

)

This being so, the third[i2] equation (36) becomes (taking account of the first two)

$$(43) \qquad P(\xi)\mu = c$$

which also means that $P(\xi)$ is invertible, and

$$(44) \qquad \mu = c/P(\xi).$$

Thus, μ is uniquely determined by ξ, by equation (44) — and μ will necessarily be invertible.

In summary:

Proposition If we assume that we have [d4] an expression (40 bis) for the unipotent element $\varepsilon_1 = \varepsilon_1(1)$, and that we have (42) ($\lambda_0 \operatorname{Tr}\rho + \operatorname{Tr}\sigma$ invertible), then

[scan 271]

the set of solutions [d1] (ξ, η, μ) of the simultaneous equations (33)(34)(35) is in 1-1 correspondence with the set of ξ sections|section of $G = G(\mathcal{M})$ satisfying the conditions

$$(45) \qquad \begin{cases} \det\xi = 1, \quad \operatorname{Tr}\xi\rho = \operatorname{Tr}\rho, \quad \text{and} \\ P(\xi) \text{ invertible section of } \mathcal{O}_S. \end{cases}$$

In terms of ξ, the corresponding solution of the system (33 : 35) is given by

$$(\xi,\ \eta = \xi\varepsilon_1(1-\mu),\ \mu = c/P(\xi))$$

— and μ (the "multiplier") is necessarily invertible.

N.B. If we had solved for η, we would have found a condition of the form

$$P'(\eta)\mu - Q'(\eta) = 0$$

with

$$Q'(\eta) = \operatorname{Tr}\eta\varepsilon_0^{-1}\rho - \operatorname{Tr}\rho$$

and the natural condition would be

$$\varepsilon_0^{-1}\rho = -\lambda_0'\sigma \qquad (\lambda_0' \text{ invertible scalar}),$$

which is equivalent to (40 bis) with $\lambda_0' = 1/\lambda_0$, and implies that

$$Q'(\eta) = c^{\text{te}} = \lambda_0' \operatorname{Tr}\sigma - \operatorname{Tr}\rho = c',$$

[scan 272]

[p. 437]

we see at once that

$$c' = \lambda_0' c$$

thus the condition c invertible is equivalent to c' invertible, and we will then have the system of equations in η

$$\det\eta = 1, \quad \operatorname{Tr}\eta\sigma = \operatorname{Tr}\sigma, \quad P'(\eta)\mu = c' \quad \text{i.e.} \quad \begin{cases} P'(\eta) \text{ invertible} \\ \mu = c'/P'(\eta) \end{cases}.$$

We see therefore that the hypotheses made are in fact symmetric in ξ, η, and allow a symmetric treatment of the solution, either via ξ, or via η.

Determination of $P(\xi)$. We will have

$$\varepsilon_1(\lambda) = 1 + N_1\lambda = (1+N_1)^\lambda$$

N_1 a square-zero matrix

$$N_1^2 = 1,$$

and

$$\operatorname{Tr}(\xi\varepsilon_1(1-\mu)\sigma) - \operatorname{Tr}\sigma = \operatorname{Tr}\xi\sigma - \operatorname{Tr}\sigma + \lambda(1-\mu)\operatorname{Tr}\xi N_1\sigma$$

thus

$$(47) \qquad P(\xi) = \operatorname{Tr}\xi\underbrace{(-N_1\sigma)}_{\substack{\| \\ N_1\rho=\rho+\sigma}}$$

Moreover [d2] we will have

$$\varepsilon_1 = 1 + N_1 \tag{48}$$

and formula (40 bis) reads

$$N_1 = -(\lambda_0 \rho \sigma^{-1} + 1) \tag{49}$$

when we already assume that ξ, η satisfy the equation of the d2 determinants and the traces[i1]

$$(54) \quad \begin{cases} AD - BC = 1 & RU - ST = 1 \\ C|A + D - B = 1 & T - S = 1 \end{cases}$$

The d3 scheme of solutions of the simultaneous equations (33) to|: (35) is then that of the (D, B) with D invertible, or again of the (S, U) with S invertible. We can identify it with the scheme of matrices

$$(55) \qquad \begin{pmatrix} \mu & M \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} 1/D & B/D \\ 0 & 1 \end{pmatrix}$$

(cf. page 410 [illeg. 1]), which normalize the 1-parameter subgroup

$$\varepsilon_0(\lambda) = \begin{pmatrix} 1 & -\lambda \\ 0 & 1 \end{pmatrix} = \rho^{-1}\varepsilon_1(\lambda)\rho.$$

[scan 275]

Let us return to the general case, where we nevertheless assume that ε_1 given by (40 bis), d1 let us put

$$(56) \qquad \varepsilon_0 = \rho^{-1}\varepsilon_1\rho = -\lambda_0\sigma^{-1}\rho = 1 + N_0, \quad \text{with}$$

$$(57) \qquad N_0 = \rho^{-1}N_1\rho = -(\lambda_0\sigma^{-1}\rho + 1),$$

so that $N_0^2 = 0$, and

$$(58) \qquad \varepsilon_0 \quad \lambda \longmapsto \varepsilon_0(\lambda) \overset{\text{dfn}}{=} 1 + \lambda N_0$$

is a 1-parameter subgroup of $SG(\mathcal{M})$, say L_0, whose normalizer in $G(\mathcal{M})$ will be denoted by B_0. We have two homomorphisms

(59)

$$B_0 \overset{\chi(\underline{u})=\text{dét}(\underline{u})}{\underset{\chi'(\underline{u}) \text{ given}}{\rightrightarrows}} \mathbf{G}_m|G_m$$

by

$$\underline{u}(\varepsilon_0(\lambda)) = \varepsilon_0(\chi'(\underline{u})\lambda)$$

or again (in linear terms in $\mathcal{M}$)

$$(60) \qquad \underline{u}N_0\underline{u}^{-1} = \chi'(\underline{u})N_0$$

m971

Marginal note. m971 I underline $\underline{u}$, so as not to confuse it with a coefficient of $\eta|\beta = \begin{pmatrix} r & s \\ t & u \end{pmatrix}$!

And we consider the subgroup

$$(61) \qquad \begin{cases} \widetilde{B}_0^* \subset B_0 \quad \text{defined by } \chi(\underline{u}) = \chi'(\underline{u}) \\ \text{i.e. by} \\ \underline{u}N_0\underline{u}^{-1} = \det(\underline{u})N_0 \end{cases}$$

so we have

$$L_0 \subset \widetilde{B}_0^*.$$

and we even have an exact sequence of group schemes

$$1 \longrightarrow L_0 \longrightarrow \widetilde{B}_0^* \xrightarrow{\det} \mathbf{G}_m|G_m \longrightarrow 1.$$

m972

Marginal note. m972 we would need to check [illeg. 4] d3 This is false, cf. below.

[scan 276]

[p. 439]

Let $\underline{u}$ be a section of $\widetilde{B}_0^*$, I feel like proving that if we put

$$\xi = [\underline{u}, \rho], \quad \eta = [\underline{u}, \sigma], \tag{63}$$

we will automatically have the relation

$$\xi = \eta\varepsilon_1(\mu - 1) \qquad \text{where } \mu = \det \underline{u}. \tag{64}$$

To reassure ourselves, let us first take $\underline{u}$ in L_0, i.e.

$$\underline{u} = \varepsilon_0(\lambda)$$

whence

$$[\underline{u}, \rho] = \varepsilon_0(\lambda)\rho\varepsilon_0(\lambda)^{-1}\rho^{-1} = \varepsilon_0(\lambda)\varepsilon_1(-\lambda)$$
$$[\underline{u}, \sigma] = \varepsilon_0(\lambda)\sigma\varepsilon_0(-\lambda)\sigma^{-1}$$

Now

$$\sigma \underbrace{\varepsilon_0(-\lambda)}_{1+N_0\lambda} \sigma^{-1} = 1 + (\sigma \underline{N_0} \sigma^{-1})\lambda$$

now [d2] by virtue of (57) we have

$$\sigma N_0 \sigma^{-1} = -(\lambda_0 \rho \sigma^{-1} + 1) \overset{(49)}{=} N_1$$

so we have

$$\begin{cases} \sigma\varepsilon_0(\lambda)\sigma^{-1} = \varepsilon_1(\lambda) & \text{and similarly} \\ \rho\varepsilon_0(\lambda)\rho^{-1} = \varepsilon_1(\lambda) \end{cases} \tag{65}$$

so we do indeed find

$$[\underline{u}, \rho] = [\underline{u}, \sigma] = \varepsilon_0(\lambda)\varepsilon_1(-\lambda)$$

i.e. (64), since here $\mu = \det u = 1$, so $\mu - 1 = 0$.

[scan 277]

We have seen that ρ and σ both transform N_0 into N_1, hence the additive 1-parameter subgroup

$$L_0 = \left\{ \underset{=1+\lambda N_0}{\varepsilon_0(\lambda)} \;\middle|\; \lambda \text{ in } \mathbf{G}_a|G_a \right\}$$

into the analogous subgroup

$$L_1 = \left\{ \underset{=1+\lambda N_1}{\varepsilon_1(\lambda)} \;\middle|\; \lambda \text{ in } \mathbf{G}_a|G_a \right\},$$

and hence $\widetilde{B}_0$ into $\widetilde{B}_1$ (defined in terms of L_1, or of N_1, as $\widetilde{B}_0^*$ in terms of L_0). [d1] The formula (64|69) can also be written

$$\rho \underline{u}^{-1} \rho^{-1} = \sigma \underline{u}^{-1} \sigma^{-1} \varepsilon_1(\mu - 1)$$

or also, replacing $\underline{u}$ by $\underline{u}^{-1}$

$$(*|**) \qquad \rho \underline{u} \rho^{-1} = \sigma \underline{u} \sigma^{-1} \varepsilon_1 \left(\frac{1}{\mu} - 1 \right).$$

Now we [d3] have

$$\rho \underline{u} \rho^{-1} = \operatorname{int}(\lambda)(\sigma \underline{u} \sigma^{-1})$$

where $\underline{\lambda = \rho\sigma^{-1}}$, and the formula $(*)|(**)$ can also be written

$$(**): \qquad \operatorname{int}(\lambda)(v) = v \cdot \varepsilon_1 \left(\frac{1}{\mu} - 1 \right) \qquad \begin{array}{l} \text{for } v \text{ in } \underline{B_1'|\widetilde{B}_1} \\ \text{and } \mu = \det v; \end{array}$$

and by virtue of (40 bis) $\operatorname{int}\lambda = \operatorname{int}(\varepsilon_1)$, so the formula reduces to

$$\operatorname{int}(\varepsilon_1)(v) = v \cdot \varepsilon_1 \left(\frac{1}{\mu} - 1 \right)$$

[p. 440]

or again

d2

$$\varepsilon_1 v \varepsilon_1(-1) = v\varepsilon_1\left(\frac{1}{\mu} - 1\right) \quad \text{i.e.}$$

$$\underbrace{\varepsilon_1}_{1+N_1}\ v = v\underbrace{\varepsilon_1\left(\frac{1}{\mu}\right)}_{1+\frac{1}{\mu}N_1} \qquad \text{i.e. } v + N_1 v = v + \frac{1}{\mu} v N_1$$

that is, finally

$$v N_1 v^{-1} = \mu N_1 \quad (= \det(v).N_1)$$

which is nothing other than the definition of $\widetilde{B}_1^*$!

We thus find a [d5]morphism

$$(66) \quad \left\{ \begin{array}{rcl} \widetilde{B}_0 & \longrightarrow & \mathcal{X}_{\rho,\sigma} \\ \underline{u} & \longmapsto & ([\underline{u}, \rho], [\underline{u}, \sigma], \det \underline{u}) \end{array} \right.$$

from $\widetilde{B}_0^*$ into the set of solutions of the system (33) to (35), is it an isomorphism?

Note that the equality $[\underline{u}, \rho] = [\underline{u}', \rho]$ means that $u^{-1}u' \in \Gamma T_\rho$ so [d6] saying that (66) is a monomorphism simply means that

$$T_\rho \cap \widetilde{B}_0 = \{1\}$$

in fact the analysis carried out must show

[scan 279]

that this intersection is also equal to $T_\sigma \cap \widetilde{B}_0^{*|\prime}$, hence contained in $T_\sigma \cap T_\rho$. I am going to assume

$$T_\sigma \cap T_\rho = \mathbf{G}_m \ (= \mathrm{Cent}\, G(M)) \tag{68}$$

(is $\supset$ | $\supseteq$, it [illeg. 2] $\subset$ | $=$)[i1] — it will suffice|suffices for this to assume that in each fiber, $1, \sigma, \rho$ are linearly independent — this is of course the case in the case we are interested in. But Thus

$$T_\sigma \cap T_\rho \cap \widetilde{B}_0^{*|\prime} \subset \mathbf{G}_m \cap \widetilde{B}_0^*,$$

but

$$\mathbf{G}_m \cap \widetilde{B}_0^* = \mu_2$$

For if λ [d2] is a local section of $\mathbf{G}_m$, then

$$\lambda N_0 \lambda^{-1} = N_0 = 1. N_0 | N_3$$

but $\det \lambda = \lambda^2$, and the condition that λ [d3] (considered as a section of B_0) be in $B_0^{*|\prime}$, is indeed $\lambda^2 = 1$. [d4]

We find [d5] in this way

$$T_\sigma \cap \widetilde{B}_0^{*|\prime} = T_\rho \cap \widetilde{B}_0^{*|\prime} = \mu_2 \tag{69}$$

and the[d6] morphism (66) is not a monomorphism, but factors

[p. 441]

as a monomorphism

$$\widetilde{B}_0/\mu_2 \hookrightarrow \mathcal{X}_{\rho,\sigma}. \tag{70}$$

To tell the truth, we see that $\widetilde{B}_0$ is not the "right" group to introduce here — in the special case $\varepsilon_0 = \begin{pmatrix} 1 & -1 \\ 0 & 1 \end{pmatrix}$, [d1] we have

$$B_0 = \left\{ \begin{pmatrix} p & \ell|l \\ 0 & q \end{pmatrix} \mid pq \text{ inv.} \right\}$$

and the relation [d2] $\chi'(\underline{u}) = \underbrace{\chi(\underline{u})}_{\det \underline{u} = pq}$ can be written, by an immediate computation

$$p/q = pq \qquad \text{i.e.} \quad q^2 = 1 \tag{71}$$

whereas the "right" group we are interested in is defined by

$$B'_0 = \left\{ \begin{pmatrix} p & \ell|e \\ 0 & 1 \end{pmatrix} \mid p \text{ inv} \right\},$$

thus with $q = 1$. To give the description in the general case, we note that the determinant function on B_0^* decomposes intrinsically into two factors

$$\det \underline{u} = p(\underline{u})q(\underline{u}), \tag{72}$$

which we can distinguish from each other precisely by the condition that

$$\underline{u} N_0 \underline{u}^{-1} = \frac{p(\underline{u})}{q(\underline{u})} N_0, \tag{73}$$

and the condition which is going to describe the "right" group for us is not (71), but rather

$$q = q(\underline{u}) = 1, \tag{74}$$

which thus defines a group that is smooth (even in characteristic 2 !) and this time fits into a canonical exact sequence

$$1 \longrightarrow L_0^* | L_0 \longrightarrow B'_0 \overset{\det}{\longrightarrow} \mathbf{G}_m \longrightarrow 1 \tag{74}$$

We now have

$$B'_0 \cap \mathbf{G}_m = \{1\}, \tag{75}$$

which implies that the morphism induced by (66)

$$B'_0 \hookrightarrow \mathcal{X}_{\rho,\sigma} \tag{76}$$

is a monomorphism.

To show that it is an isomorphism, it now suffices, by virtue of general principles, to show that it is surjective on the points with values in an algebraically closed field (if that can|for simplify life for us). I drop the details of the|of verifications.

d1

Remark|Remark We can consider, by condition (40 bis), that we start from a unipotent section $\varepsilon_1 = 1 + N_1 \quad (N_1^2 = 0)$[i1] [d2] of $SG(M)$, and from a section ρ, and that σ is deduced from it by [d3]the[i2]

formula

$$\sigma = -\varepsilon_1^{-1}\rho \ (= -(1 - N_1)\rho \quad \text{i.e.} \quad \sigma = -\rho + N_1\rho, \quad \text{i.e.} \quad \rho + \sigma = N_1\rho) \tag{77}$$

m974

Marginal note. [m974] I take the constant which occurs in|in the case that interests us most, where $-\sigma^{-1} = \sigma$, so that (40 bis) becomes $\varepsilon_1 = \rho\sigma$.

(I drop the constant pure|for[i1] λ_0, for [d1] the situation is not changed when we replace ρ, σ by scalar multiples, for F_ρ and F_σ is not changed …) Condition (42) then becomes

$$c = \operatorname{Tr}\rho + \operatorname{Tr}\sigma = \operatorname{Tr}(1 - \underbrace{\varepsilon_1^{-1}}_{1-N_1})\rho = \operatorname{Tr} N_1\rho \in \Gamma\mathcal{O}_S^*$$

m975

Marginal note. [m975] N.B. we have

$$\begin{cases} \rho + \sigma = N_1\rho = \rho N_0 \\ \qquad\quad = -N_1\sigma = -\sigma N_0 \end{cases} \tag{78 bis}$$

let $\gamma_0|\varepsilon_0$ [illeg. 4]

(invertible section of $\mathcal{O}_S$). We assume that $1, \rho, \sigma$ are linearly independent in each fiber, it amounts to the same to say that $1, \rho$, and $N_1\rho$ are, or again that $\rho^{-1}, 1$ and N_1 are, or that $1, \sigma, N_1\sigma$ are, or $\sigma^{-1}, 1, N_1$. In summary

m976

Marginal note. [m976] N.B. (After possibly multiplying the|the ρ by an invertible scalar) we $\operatorname{Tr}\gamma_0|\delta_0 = 1$ ($\gamma_0|\delta_0 = N_1\rho$) ! (which normalizes entirely, with the relation $\varepsilon_1 = -\rho\sigma^{-1}$, the arbitrary|intrinsic scalar factors of ρ, σ)

Proposition. Let $M|\mathcal{M}$ be an Azumaya algebra over the base scheme S, N_1 a section of square zero [d2] i.e. $\varepsilon_1 = 1 + N_1$ a unipotent section, ρ, σ[i3] [d3] some[i4] sections related by

$$\varepsilon_1 = -\rho\sigma^{-1} \quad \text{i.e.} \quad \sigma = -\varepsilon_1^{-1}\rho \quad \text{i.e.} \quad \rho + \sigma = N_1\rho \quad \text{i.e.} \quad \sigma + \rho|\rho + \sigma = -N_1\sigma \qquad (40|78)$$

[d4] (which thus determines each of the three sections †[d5]$|\varepsilon_1$ ρ, σ and ε_1 (or N_1) in terms of the other two, and we can choose arbitrarily ρ and [d6] ε_1 i.e. ρ and N_1 of square zero) — we

$$L_0 = \text{subgroup scheme } \varepsilon_0(\mathrm{G}_a)$$
$$L_1 = \underline{\qquad\qquad\qquad\qquad\qquad\qquad} \quad \varepsilon_1(\mathrm{G}_a),$$

(thus $\rho(L_0) = \sigma(L_0) = L_1$), let B_0' be the subgroup scheme of B_0 defined in terms of ε_0,[i7] by (74), so that B_0 fits into an exact sequence

$$1 \longrightarrow L_0 \hookrightarrow B_0 \overset{\det}{\longrightarrow} \mathrm{G}_m \longrightarrow 1,$$

and that $\underline{u} \in \Gamma B_0$ implies

$$\underline{u}(N_0) = \det(\underline{u})N_0, \qquad \text{i.e.}$$
$$\underline{u}(\varepsilon_0(\lambda)) = \varepsilon_0(\det(\underline{u})\lambda).$$

This being so, consider the morphism

$$B_0' \longrightarrow G(\mathcal{M}) \times G(\mathcal{M}) \times \mathbb{E}^1|\mathbb{E}'$$
$$\underline{u} \longmapsto ([\underline{u}, \rho], [\underline{u}, \sigma], \det(\underline{u})).$$

This takes its values in $\mathcal{X}_{\rho,\sigma}$, the scheme of solutions [d1] simultaneous equations (33) to (35), and induces an isomorphism

$$B'_0 \simeq | \xrightarrow{\sim} \mathcal{X}_{\rho,\sigma}. \tag{79}$$

[d2] Let us recall also|thus for the record

Corollary The projection

$$\begin{aligned} \mathcal{X}_\rho &\longrightarrow G(\mathcal{M}) \\ (\zeta, \eta, \mu) &\longmapsto \zeta \end{aligned}$$

is a monomorphism, and the image consists of the ζ satisfying

$$\det\zeta = 1, \quad \operatorname{Tr}\zeta\rho = \operatorname{Tr}\rho, \quad \operatorname{Tr}\zeta \underbrace{(\rho+\sigma)}_{\| \; -N_1\sigma=+N_1\rho=\rho N_0=-\sigma N_0} \text{ invertible}$$

Likewise the projection

$$\begin{aligned} \mathcal{X}_{\rho} &\longrightarrow G(\mathcal{M}) \\ (\zeta,\eta,\mu) &\longmapsto \eta \end{aligned}$$

is a monomorphism, and the image consists of the η satisfying

$$\det\eta = 1, \quad \operatorname{Tr}\eta\sigma = \operatorname{Tr}\sigma, \quad \operatorname{Tr}\eta(\rho+\sigma) \text{ invertible}$$

Finally, we will have [d3]

$$\operatorname{Tr}\zeta(\rho+\sigma) = \operatorname{Tr}\eta(\rho+\sigma) = 1/\mu. \tag{80}$$

Scholium By transport of structure, we find a group|groups structure on $\mathcal{X}_{\rho,\sigma}$. [p. 283]

[scan 285]

Making it explicit, we find

$$\begin{array}{rcl} \text{if } \underline{u} & \text{corresponds to} & \zeta,\eta,\mu \\ \underline{u}' & — & \zeta',\eta',\mu'|\mu'' \\ \underline{u}'' = \underline{u}'\underline{u} & — & \zeta'',\eta'',\mu'' \end{array}$$

we will have

$$\mu'' = \mu\mu', \quad \zeta'' = u'(\zeta)\zeta', \quad \eta'' = u'(\eta)\eta' \tag{81|21}$$

where we set, as usual

$$u'(x|X) = u'x|Xu'^{-1},$$

[d1] for two elements x, u' of a group.

III) Study of the equation (Continued)

$$\begin{aligned} \alpha\rho(\alpha)^{-1} &= \beta\sigma(\beta)^{-1}\varepsilon_1(\mu-1) \\ (\alpha,\beta \in \Gamma G(\mathcal{M}), &\quad \mu \in \Gamma\mathbb{E}^1_S|\mathcal{O}^*_S) \end{aligned} \tag{82}$$

i.e.

$$[\alpha,\rho] = [\beta,\sigma]\varepsilon_1(\mu-1). \tag{82bis}$$

Let $\mathcal{G}_{\rho,\sigma}$ be the scheme of solutions, we thus have a morphism

$$\begin{aligned} \mathcal{G}_{\rho,\sigma} &\longrightarrow \mathcal{X}_{\rho,\sigma} \\ (\alpha,\beta,\mu) &\longmapsto (\alpha\rho(\alpha)^{-1}, \beta\sigma(\beta)^{-1}, \mu) \end{aligned} \tag{83}$$

and it follows from the preceding theorem that this is [d3] an epimorphism, more precisely, [p. 284]

[scan 286]

[p. 444]

We have a canonical section

$$\begin{array}{ccc} \mathcal{G}_{\rho,\sigma} & \rightleftarrows & \mathcal{X}_{\rho,\sigma} \\ & & \uparrow \\ & & B'_0 \end{array} \qquad \begin{array}{c} ([\underline{u},\rho],[\underline{u},\sigma],\det \underline{u}) \\ \uparrow \\ \underline{u} \end{array}$$

$$(\underline{u},\underline{u},\det \underline{u}) \longleftarrow\!\shortmid \underline{u} \tag{84}$$

This section takes its values in the "diagonal", [d1] which corresponds to the pairs $(\underline{u},\mu)$ $(\underline{u} \in \Gamma\mathcal{M}^*,\ \mu \in \Gamma\mathbb{E}^1|\mathbb{E}')$[i1] such that

$$[\underline{u},\rho] = [\underline{u},\sigma]\varepsilon_1(\mu - 1), \tag{85}$$

which we will try|try to determine as well.

Combining the results of (I, and II) we see that the general solution of (82) will be formed|provided by the,

$$(\underline{ua},\underline{ub},\mu = \det \underline{u})$$

where $\underline{u}$ is a section of B'_0, $\underline{a}$ a [d2] section of T_ρ, $\underline{b}$ a section of T_σ.

To be precise

Theorem. Consider

$$\begin{aligned} B'_0 \times T_\rho \times T_\sigma &\longrightarrow G \times G \times \mathbb{E}^1|\mathbb{E}' \\ (\underline{u},\underline{a},\underline{b}) &\longmapsto (\underline{ua}^{-1}, \underline{ub}^{-1}, \det \underline{u}) \end{aligned} \tag{86}$$

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 287]

It takes its values in $\mathcal{G}_{\rho,\sigma}$, and is a monomorphism — hence induces an isomorphism

$$B'_0 \times T_\rho \times T_\sigma \xrightarrow{\sim} \mathcal{G}_{\rho,\sigma} \tag{87}$$

More precisely, let [d1] (α, β, μ) be a section of $\mathcal{G}_{\rho,\sigma}$, then there exist then some[i1] unique sections [d2] $\underline{a}$ of T_ρ, $\underline{b}$ of T_σ, such that we have [d3]

$$\alpha\underline{a}, \beta\underline{b} \in \Gamma B'_0 \tag{88}$$

[d4] and we will then necessarily have

$$\alpha\underline{a} = \beta\underline{b} \ (\overset{\text{df}}{=} \underline{u})$$

whence of course

$$([\alpha, \rho], [\beta, \rho]) = ([\underline{u}, \rho], [\underline{u}, \sigma])$$

and the unique μ satisfying (82) is therefore $\det \underline{u}$ [d6] ; thus

$$(\alpha, \beta, \mu) = (\underline{u}\underline{a}^{-1}, \underline{u}\underline{b}^{-1}, \det \underline{u}) \quad \text{(uniquely)} \tag{89}$$

[d7]

Proof. It remains only to make explicit the uniqueness of α, β satisfying (88), which is a consequence of

$$T_\rho \cap B'_0 = T_\sigma \cap B'_0 = \{1\} \tag{90}$$

which we had forgotten to make explicit in (II). [p. 286]

[p. 445]

In terms of the sole[i1] datum of α, we will therefore have an $\underline{a}$ uniquely determined by the condition $\alpha\underline{a} \in \Gamma B'_0$, and we will have

$$(91) \qquad \underline{a} = c_0\rho + d_0 \qquad \begin{matrix} c_0, d_0 \in \Gamma(\mathcal{O}_S) \\ \text{determined by } \alpha \end{matrix}$$

likewise we will have

$$(92) \qquad \underline{b} = t_0\sigma + u_0 \qquad \begin{matrix} t_0, u_0 \in \Gamma(\mathcal{O}_S) \\ \text{determined by } \beta \end{matrix}$$

in such a way therefore that we will have

$$(93) \qquad \alpha\underline{a} = \beta\underline{b} \qquad (\overset{\text{dfn}}{=} \underline{u})$$

In the numerical case

$$\rho = \begin{pmatrix} 0 & 1 \\ -1 & 1 \end{pmatrix}, \qquad \sigma = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix},$$

setting

$$\alpha = \begin{pmatrix} a & b \\ c & d \end{pmatrix}, \qquad \beta = \begin{pmatrix} r & s \\ t & u \end{pmatrix}$$

we will have (cf. page 398′ (76)(78)) unless I am mistaken

$$(94) \qquad \underline{a} = \frac{1}{\delta D}(c\rho + d)$$

$$\left(= \frac{1}{c^2 + cd + d^2}(c\rho + d)\right)$$

[i2] where $\delta D = c^2 + cd + d^2$, — D being the corner coefficient of

$$\zeta = \alpha\rho(\alpha)^{-1} = \begin{pmatrix} A & B \\ C & D \end{pmatrix}$$

$$(95) \qquad \underline{b} = \frac{1}{\delta' U}(t\sigma + u)$$

$$= \frac{1}{t^2 + u^2}(t\sigma + u)$$

[i3] where $\delta' U = t^2 + u^2$, — U the corner coefficient of

$$\eta = \beta\sigma(\beta)^{-1} = \begin{pmatrix} R & S \\ T & U|u \end{pmatrix},$$

m979

Marginal note. m979 $\delta = \det \alpha = ad - bc$
$\delta' = \det \beta = ru - st$

m980

Marginal note. m980 We will have to come back to these formulas in the general case

the only trouble, in making the link with the "brutal" computations of loc. cit, is in the factor τ_∞^α on page 398′ (78), where $\alpha = \alpha_2(\mu) \in \mathbb{Z}/2.\mathbb{Z}$, in the case where $\alpha = 1$ —

[p. 287]

[scan 289]

at first sight there seems to be an incompatibility between the (simpler) theory developed here, and this factor τ_∞^α — which I must think has very good reasons for being there ! And there it is — in loc. cit. we wrote the equation of the loops with the possibility of a sign

$$\zeta = \varepsilon\eta \underbrace{\ell_1^\nu}_{\varepsilon_1(\mu-1) \text{ with the current notation}}, \qquad \varepsilon \in \{\pm 1\},$$

m981

Marginal note. m981 here ζ and η are d1 defined as $\alpha\rho(\alpha)^{-1}$, $\beta\sigma(\beta)^{-1}$

this is thus a generalization relative to the equation set down at the beginning, where we assumed $\varepsilon = +1$. We will therefore have to later take up the preceding theory again, in the more general context of an equation

$$(95|96) \qquad \underset{\substack{\| \\ \alpha\rho(\alpha)^{-1}}}{\zeta} = \varepsilon. \underset{\substack{\| \\ \beta\sigma(\beta)^{-1}}}{\eta} \varepsilon_1(\mu - 1) \qquad \varepsilon \text{ section of } \mathcal{O}_S$$

where we will have to have (taking the determinants of the two sides) d2

$$\varepsilon^2 = 1$$

— but there is probably no reason to suppose that we have $\varepsilon \in \{\pm 1\}$. But I will first continue the calculations in the present case $\varepsilon = +1$.

[p. 446]

IV A canonical pinning

Let us recall that giving (over a base scheme S)[i1] a form G of $\mathrm{Gl}(2)_S$, or SG of $\mathrm{Sl}(2)_S$, or PG of $\mathrm{GP}(1)_S$,[i2] or again an Azumaya|Azumaya algebra $\mathcal{M}$ (form of $M_2(\mathcal{O}_S)$), amounts to giving a bundle of projective lines $\mathcal{P}|P$ over S. $\mathcal{P}|P$ can be interpreted as the scheme of Borel subgroups B[i3] of G, or SB[i4] of SG, or PB of PG,[i5] or as the scheme of "one-parameter additive[i6] "Borelian" subgroups" (i.e. identical with the unipotent part of a suitable Borel) [d1]L[i7] of G, or of SG, or of PG (N.B. The canonical morphisms $SG \longrightarrow G \longrightarrow PG$ induce bijections between the sets of[i8] Borel subgroups of the three groups in question, and also between the sets of "Borelian" 1-parameter subgroups of these groups). Likewise, $\mathcal{P}|P$ can be interpreted in terms of the sections N [d2] of $\mathcal{M}$ which are nonzero on every fiber and such that [d3],

$$(1) \qquad \det N = 0, \quad \mathrm{Tr}\, N = 0 \qquad \text{hence } N^2 = 0$$

[i9] (the "strictly nilpotent" and regular (nonzero on each fiber)[i10] sections), to every such section will correspond|corresponds a 1-parameter[i11] Borelian subgroup of SG, as the image of $\mathbf{G}_a|\mathrm{G}_a$ under

$$(2) \qquad \lambda \longmapsto e_N(\lambda) = \exp(\lambda N) = 1 + \lambda N.$$

But it is obvious that if N and N' are two such

[p. 447]

The [d1] sections of G (in fact of SG) satisfying (3), and which are not $= 1$ on any fiber,[i1] are called the [d2] regular[i2] unipotent sections — two such sections e, e'[i3] are considered "equivalent" if we have

Steinberg's terminology

$$(4) \qquad e' = e^{\lambda} \overset{\text{def|dfn}}{=} e(\lambda) \qquad (\lambda \in \Gamma \mathbf{G}_a | \mathrm{G}_a = \Gamma \mathcal{O}_S)$$

$$\overset{\text{def}}{=} (1 + \lambda N)$$

$$= 1 + \lambda(e - 1) = (1 - \lambda) + \lambda e.$$

we will have necessarily[t] $\lambda \in \Gamma \mathbf{G}_m | \mathrm{G}_m$

We thus see that the regular (strictly) nilpotent sections of $\mathcal{M}$ correspond 1-1[i5] to the regular unipotent sections, and the equivalence relation of homothety becomes that of equivalence by $e \longmapsto e^{\lambda}$ — and the equivalence classes of either correspond to the Borelian additive subgroups of G (or SG, or PG via $SG \longrightarrow PG$) — or again $\longrightarrow$ (taking the normalizers of these in G, SG or PG) to the Borels of these groups, i.e. to the sections of $\mathcal{P}|P$ over S.

Suppose such a section x_∞ of $\mathcal{P}|P$ is given, this thus allows us to [d5] consider $\mathcal{P}|P$ as obtained from an affine line[i6] bundle [d6]

$$E \quad (= \mathcal{P}|P \setminus \{x_\infty\}), \tag{5}$$

and x_∞ is also given by a Borelian 1-parameter subgroup

$$L \subset SG \subset G \tag{6}$$

(which, under $SG \longrightarrow PG$, again gives a Borelian additive subgroup $L \hookrightarrow PG$ in PG ...). Locally, L will be generated by a regular unipotent section

$$e = 1 + N \qquad (N \text{ regular nilpotent}) \tag{7}$$

as the subgroup of the

$$e^\lambda = \underline{e}(\lambda) | e_\lambda(\lambda) = e_N(\lambda) = 1 + \lambda N, \tag{8}$$

but as we have said, e, N are not determined intrinsically in terms of $L \subset SG$. More precisely, L is canonically endowed with a vector bundle structure (preserved by its normalizer in G), [d1] to|: wit precisely that obtained by transport of structure from that of G_a under

$$\underline{e} : G_a \xrightarrow{\sim} L \qquad \underline{e}(\lambda) = e^\lambda = 1 + \lambda N,$$

and [d2] L is thus identified with the vector bundle canonically|canonical associated with the line bundle $\mathcal{N} \subset {}_1M$ [d3] defined by the N's

$$L \simeq \check{V}(\mathcal{N}), \tag{9}$$

the choice of e, or of N, corresponds simply to that of a basis N^{i1} of $\mathcal{N}$, or of a section e^{i2} of L^* [d1] i.e. of a section e of L^{i3} which is $\neq 1$ on every fiber.
m983

Marginal note. [m983] Let us note that L is also canonically isomorphic to the vector bundle of translations of the affine line bundle $\mathbb{P}|P \setminus \{x|x_\infty\}$.

Let us return to equation (32), and note that ρ and σ enter into it only modulo transformations $\rho \mapsto \lambda\rho$, $\sigma \mapsto \lambda'\sigma$ $(\lambda, \lambda' \in \Gamma G_m)^{i4}$ (which do not change the commutators $[\alpha, \rho]$ and $[\beta, \sigma]$); [d2] We can express this by saying that ρ, σ enter only through[i5] [d3] their images in $\Gamma(PG)$, and moreover we have

$$\begin{aligned} PG \xrightarrow{\sim} \underline{\mathrm{Aut}}_{Sgr|S\text{-gr}}(G) \simeq \underline{\mathrm{Aut}}_{S\text{-gr}}(SG) \simeq \underline{\mathrm{Aut}}_{Sgr|Sg}(PG) \\ \simeq \underline{\mathrm{Aut}}_{S\text{-Alg}}(M) \simeq \underline{\mathrm{Aut}}_{S}(\mathbb{P}|P) \end{aligned} \tag{10|40}$$

and our remark amounts to saying that ρ and σ enter only through their action on G (or on SG), which is also clear from the formulas

$$[\alpha, \rho] = \alpha\rho(\alpha)^{-1}, \qquad [\beta, \sigma] = \beta\sigma(\beta)^{-1}.$$

On the other hand, the factor $\varepsilon_1(\mu - 1)$ of (32) can be regarded as a section of a [d4] additive subgroup L_1 of G (in fact, of SG), which we suppose of [p. 293]

[scan 295]

course Borelian — equation (32) is then written in the form (where μ no longer enters, only α and β)

$$[\beta, \sigma]^{-1}[\alpha, \rho] \in \Gamma L_1 \tag{11}$$

or

$$[\alpha, \rho] = [\beta, \sigma] \cdot \gamma \qquad \text{with } \gamma \in \Gamma L_1. \tag{12}$$

In the form (12), we can regard it as an equation relating α, β, γ.

Let us consider the image d2

$$\widetilde{L}_1 \subset PG \tag{13}$$

of L_1 under $G \longrightarrow PG$, the relation (40 bis) is then written in the form

$$\tilde{\varepsilon}_1 \overset{\text{dfn}}{=} \tilde{\rho}\tilde{\sigma}^{-1} \in \Gamma\widetilde{L}_1 \qquad (\underset{\text{can}}{\overset{\sim}{\longleftarrow}} \Gamma L_1). \tag{14}$$

d4 This section therefore comes from a section well determined d5 in terms of $\tilde{\rho}, \tilde{\sigma}$

$$\varepsilon_1 \in \Gamma L_1, \tag{15}$$

described in terms of ρ, σ directly i2 by the condition that we have a relation of the form

$$\varepsilon_1 = -\lambda_0 \rho \sigma^{-1} \qquad (\lambda_0 \in \Gamma G_m) \qquad (16) = (40 \text{ bis})$$

for convenience i3 — (because of the application to the special case that interests us most …).
m984

Marginal note. [m984] N.B. λ_0 is uniquely determined by ρ, σ if 2 invertible on S; more general[ly], if 2 regular [d6]element[i4] of $\Gamma(S, \mathcal{O}_S)$. (But in characteristic 2 λ_0 is not determined except modulo μ_2 !!!).

[p. 449]

Let us return to the general situation of a form G of $\mathrm{Gl}(2)_S|\mathrm{GL}(2)_S$, and suppose that it can be written in the form

$$G = \underline{\mathrm{Aut}}_{\mathcal{O}_S\text{-Mod}}(F), \tag{17}$$

where F is an $\mathcal{O}_S$-Module local[ly] free of rank 2,

This is the case as soon as we have a section x of $\mathbb{P}|P$ over S, i.e. a Borel additive subgroup L of G, or of SG, (in fact we can then take for F the extension of $\mathcal{O}_S$ by $\mathcal{N}$ which determines the affine-line bundle $\mathbb{P}|P \setminus \{x\}$). But the|the $\mathbb{P}|P$ is realized as [d1]

$$\mathbb{P}|P = \mathbf{P}|P(F) \simeq \check{\mathbf{P}}|\check{P}(F) \tag{18}$$

the projective bundle associated with F, [d2] i.e.[i1] the sections of $\mathbb{P}|P$ are identified with the "lines" $D \subset F$.

We will have

$$M = \underline{\mathrm{End}}_{\mathcal{O}_S\text{-mod}}(F) \simeq \check{F} \otimes_{\mathcal{O}_S} F \tag{19}$$

and the sub-[d4]Module[i2] [d5]$\mathcal{N}$[i3] associated with the section x_D of $\mathbb{P}|P$ [d6] is none other than [d7]

$$\mathcal{N} = D^\circ \otimes D \qquad (D^\circ \simeq (F/D)^\vee \subset \check{F},\ \text{the orthogonal to } D \text{ in } \check{F}) \tag{20}$$

its sections are the $u : F \longrightarrow F$ such that

$$u(F) \subset D, \quad u(D) = \{0\}. \tag{21}$$

[scan 297]

Proposition [d1] Let G be a form of $\mathrm{Gl}(2)_S|\mathrm{GL}(2)_S$, ρ, σ two sections of G such that $\tilde{\rho}\tilde{\sigma}^{-1} = \tilde{\varepsilon}_1$ is a [illeg. 1][i2] unipotent-[d2] section of PG, linked by the relation (16). Then[i1] the following conditions are equivalent

(i) ε_1 is [d3] a regular section[i3] (i.e. [d4] $\neq 1$[i4] on each fiber), i.e. $\varepsilon_1 = 1 + N_1$, with N_1 a basis of $\mathcal{N}_1$) and $\tilde{\rho}^{-1}(x_1)$ is a section of $\mathbb{P}|P$ [d5] $\neq x_1$ in each fiber.
m985

Marginal note. [m985] N.B. We have denoted by x_1 the section of $\mathbb{P}|P$ over S corresponding to L_1.

(ii) Ditto|Item, with $\tilde{\sigma}^{-1}$ in place of $\tilde{\rho}$.
m986

Marginal note. m986 (i bis) (ii bis) | Ditto|Item, with $\widetilde{\sigma}, \tilde{\rho}$ in place of $\widetilde{\sigma}^{-1}, \tilde{\rho}^{-1}$.

(iii) We have (42), i.e. $c = \lambda_0 \mathrm{Tr}\,\rho + \mathrm{Tr}\,\sigma$ is invertible.

Proof. We have, thanks to the fact that $\tilde{\rho}\widetilde{\sigma}^{-1} \in \Gamma\widetilde{L}_1$, normalizes $\widetilde{L}_1$, or what amounts to the same, L_1,[i5] the relation

$$\tilde{\rho}^{-1}(L_1) = \tilde{\sigma}^{-1}(L_1)$$

or what amounts to the same, we have

$$\tilde{\rho}^{-1}(x_1) = \tilde{\sigma}^{-1}(x_1), \tag{22|24}$$

which proves the equivalence of (i) and (ii).

Let us show that $(i) \iff (iii)$. We may assume that S is the spectrum of an algebraically closed field, if it suits us, and we may assume $\lambda_0 = 1$ (at the cost [d7] of replacing ρ by $\lambda_0\rho$). If we had $\varepsilon_1 = 1$ i.e. [d8] $1 = -\rho\sigma^{-1}$ i.e. $\rho + \sigma = 0$, we would have [d9] $\mathrm{Tr}(\rho + \sigma) = \mathrm{Tr}\,\rho + \mathrm{Tr}\,\sigma = 0$, so (iii) implies the regularity of ε_1 i.e. of N_1, [d10] we may assume[i7] therefore that ε_1 is regular. We have to show that if we have such a regular unipotent [d11] endomorphism[i8] $\varepsilon_1 = 1 + N_1$[i9], of F, associated with a $D \subset F$, [p. 296]

called|whose $\tilde{T}$ in $PG = \underline{\mathrm{Aut}}_S(\mathcal{P}|P)$. We can also say that the datum of two distinct sections [d1] x_0, x_1 of the projective bundle $\mathcal{P}|P$ [d2] amounts to that of the Borel B_1 corresponding to the choice of x_1), and of the maximal torus T of B_1 (which is then written

$$B_1 = T.L_1 \qquad (\textit{produit } \tfrac{1}{2} \text{ direct}) \tag{26}$$

m987

Marginal note. [m987] the pair (B_1, T) is called a Killing pair.

which allows us then to recover x_0 as one corresponding to[i1] the unique Borel B_0 such that $T = B_0 \cap B_1$. (The Borels B_0 such that $B_0 \neq B_1$ on each fiber, i.e. such that $B_0 \cap B_1$ is a torus,[i2] correspond one-to-one to the maximal tori T of B_1, by the preceding formula $T = B_0 \cap B_1$.)

This also amounts to: the datum, in addition to B_1, i.e. to x_1,[i3] of a section x_0,[i4] of the affine-line bundle $U_1 =^{i5} \mathcal{P}|P \smallsetminus \{x_1\}$, [d3] i.e. of an isomorphism from U_1 onto the[i6] vector bundle L_1 of its translations

$$U_1 \overset{\text{dfn}}{=} \mathcal{P}|P \smallsetminus \{x_1\} \xrightarrow{\sim} L_1. \tag{27}$$

To finish "pinning" the situation (i.e.

Scans 302–320

[scan 302]

[p. 452]

Let us note that (33), can be written $\rho = -(1 + N_1)\sigma$ i.e. [d1]

$$\rho + \sigma = -N_1\sigma \tag{35}$$

multiplying by N_1 on the left we get

$$N_1\rho + N_1\sigma = 0$$

(since $N_1^2 = 0$), moreover

$$N_1\rho = \rho N_0, \qquad N_1\sigma = \sigma N_0$$

(for $N_1 = \rho N_0\rho^{-1} = \sigma N_0\sigma^{-1}$), so (35) can be written

$$\rho + \sigma = -N_1\sigma = +N_1\rho = -\sigma N_0 = +\rho N_0 \overset{\text{definition}}{=} N. \tag{35|36}$$

moreover when ρ is in the general form $\rho = \begin{pmatrix} 0 & u \\ v & w \end{pmatrix}$ we find

$$N = \begin{pmatrix} 0 & 0 \\ 0 & u \end{pmatrix}, \qquad N^2 = \begin{pmatrix} 0 & 0 \\ 0 & u^2 \end{pmatrix}$$

so the normalization (34) $u = 1$ also means

$$\rho + \sigma = \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix}, \tag{37}$$

or again (since u is invertible)

$$N^2 = N \qquad (\text{where } N = \rho + \sigma) \tag{37 bis}$$

[i1] or again that σ is given in terms of ρ by

$$\sigma = \begin{pmatrix} 0 & -1 \\ -v & 1 - w \end{pmatrix}. \tag{38}$$

moreover, $N_0 = \rho N_1 \rho^{-1}$[i2] will be of the form $\begin{pmatrix} 0 & \alpha \\ 0 & 0 \end{pmatrix}$, an immediate calculation shows that α is given by the formula $u = \alpha v$, i.e. (if we normalize by $u = 1$)

m988

Marginal note. [m988] N.B. We see at once that the conditions considered so far imply that $1, \rho, \sigma$ are linearly independent in each fiber, i.e. $T_\rho \cap T_\sigma = \mathbb{G}_m$! i.e. $\widetilde{T}_\rho \cap \widetilde{T}_\sigma = \{1\}$.

$$N_0 = \begin{pmatrix} 0 & 1/v \\ 0 & 0 \end{pmatrix}, \qquad \varepsilon_0 = \begin{pmatrix} 1 & 1/v \\ 0 & 1 \end{pmatrix}. \tag{39}$$

m989

Marginal note. [m989] N.B. We will have

$$\boxed{\sigma^{-1}\rho = -\varepsilon_0} \tag{39 bis}$$

For $\sigma^{-1}\rho = \sigma^{-1}(\rho\sigma^{-1})\sigma = \sigma^{-1}(-\varepsilon_1)\sigma = -\sigma^{-1}(\varepsilon_1) = -\varepsilon_0$.

[d2] These canonical normalizations having been made, let us return to the proposition on page 436 ; since ε_1 has been chosen (in as canonical a way as can be) there is no longer any drawback

to [d3]leaving[i1] equation (32) (put into the apparently more intrinsic form (11) or (12)) in the [d4] initial form, where a priori we were thinking of introducing the parameter γ with

$$[\alpha,\rho]=[\beta,\rho]\varepsilon_1(\gamma)\,;\quad -$$

but it appears that it is $\gamma+1=\mu$ that has a particularly remarkable significance in the theory — so we keep|will keep its form (32), with the factor $\varepsilon_1(\mu-1)$.

The expression (97) for $P(\zeta)$, thanks to (37), can be written

$$P(\zeta)=D\qquad\text{for }\zeta=\begin{pmatrix}A&B\\C&D\end{pmatrix},\tag{40}$$

[scan 304]

[p. 453]

Thus the proposition tells us that the scheme $\mathcal{X}_{\rho,\sigma}$[i1] of simultaneous solutions in (ζ,η,μ) of

$$\det\zeta=\det\eta=1,\qquad\zeta=\eta\varepsilon_1(\mu-1),\qquad\operatorname{Tr}(\zeta\rho)=\operatorname{Tr}\rho,\qquad\operatorname{Tr}\eta\sigma=\operatorname{Tr}\sigma|\alpha\tag{41}$$

is isomorphic, via $(\zeta,\eta,\mu)\longrightarrow\zeta$, to that of the $\zeta=\begin{pmatrix}A&B\\C&D\end{pmatrix}$ satisfying the conditions

$$\underbrace{\det\zeta}_{AD-BC}=1,\qquad\underbrace{\operatorname{Tr}\zeta\rho}_{(C+wD)+vB}=\underbrace{\operatorname{Tr}\rho}_{w},\qquad\text{and }D\text{ an invertible section of }\mathcal{O}_S\tag{42}$$

and we recover μ in terms of ζ by

$$\mu=1/D\tag{43}$$

(here $c=\operatorname{Tr}(\rho+\sigma)=\operatorname{Tr}\begin{pmatrix}0&0\\0&1\end{pmatrix}=1$), whence η by $\eta=\zeta\varepsilon_1(1-\mu)$.

The subgroup scheme B_0' of page 442′ is none other than the scheme of matrices

$$B_0'=\left\{\begin{pmatrix}\mu&\lambda\\0&1\end{pmatrix}\,\middle|\,\mu\in\Gamma\mathbb{G}_m,\ \lambda\in\Gamma\mathbb{G}_a\right\}\tag{44}$$

We are going to make explicit the isomorphism (79)

$$\underline{u}\longmapsto([\underline{u},\rho],[\underline{u},\sigma],\det\underline{u})\tag{45}$$

in terms of the coefficients μ,λ of B_0', with the help of the parameters v,w in $\rho=\begin{pmatrix}0&1\\v&w\end{pmatrix}$.

Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

[scan 305]

We find [d1]

$$\begin{aligned}
[\underline{u},\rho] &= \begin{pmatrix}\mu & \lambda\\ 0 & 1\end{pmatrix}\begin{pmatrix}0 & 1\\ v & w\end{pmatrix}\frac{1}{\mu}\begin{pmatrix}1 & -\lambda\\ 0 & \mu\end{pmatrix}\begin{pmatrix}-\frac{1}{v}\end{pmatrix}\begin{pmatrix}w & -1\\ -v & 0\end{pmatrix}\\
&= -\frac{1}{\mu v}\begin{pmatrix}\lambda v & \mu+\lambda w\\ v & w\end{pmatrix}\begin{pmatrix}w+\lambda v & -1\\ -\mu v & 0\end{pmatrix}\\
&= -\frac{1}{\mu v}\begin{pmatrix}v^2\lambda^2 - v\mu^2 - vw\lambda\mu + vw\lambda & -\lambda v\\ v^2\lambda - vw\mu + vw & -v\end{pmatrix}\\
&= \frac{1}{\mu}\begin{pmatrix}-v\lambda^2 + w\lambda\mu + \mu^2 - w\lambda & \lambda\\ -v\lambda + w\mu - w & 1\end{pmatrix}
\end{aligned}$$

[m990]

Marginal note. [m990] now|and for $\sigma = \begin{pmatrix}0 & -1\\ v' & w'\end{pmatrix}$ with $v' = -v$, $w' = 1 - w$

$$\begin{aligned}
[\underline{u},\sigma] &= \begin{pmatrix}\mu & \lambda\\ 0 & 1\end{pmatrix}\begin{pmatrix}0 & -1\\ v' & w'\end{pmatrix}\frac{1}{\mu}\begin{pmatrix}1 & -\lambda\\ 0 & \mu\end{pmatrix}\begin{pmatrix}\frac{1}{v'}\end{pmatrix}\begin{pmatrix}w' & 1\\ -v' & 0\end{pmatrix}\\
&= \frac{1}{\mu v'}\begin{pmatrix}\lambda v' & -\mu+\lambda w'\\ v' & w'\end{pmatrix}\begin{pmatrix}w'+\lambda v' & 1\\ -\mu w' & 0\end{pmatrix}\\
&= \frac{1}{\mu v'}\begin{pmatrix}v'^2\lambda^2 + v'\mu^2 - v'w'\lambda\mu + v'w'\lambda & \lambda v'\\ v'^2\lambda - v'w'\mu + v'w' & v'\end{pmatrix}\\
&= \frac{1}{\mu}\begin{pmatrix}v'\lambda^2 - w'\lambda\mu + \mu^2 + w'\lambda & \lambda\\ v'\lambda - w'\mu + w' & 1\end{pmatrix}\\
&= \frac{1}{\mu}\begin{pmatrix}-v\lambda^2 + (w-1)\lambda\mu + \mu^2 - (w-1)\lambda & \lambda\\ -v\lambda + (w-1)\mu - (w-1) & 1\end{pmatrix}
\end{aligned}$$

In summary

$$\begin{cases}
\zeta = [\underline{u},\rho] = \dfrac{1}{\mu}\begin{pmatrix}\mu^2 + (-v\lambda + w(\mu-1))\lambda & \lambda\\ -v\lambda + w(\mu-1) & 1\end{pmatrix}\\
\eta = [\underline{u},\sigma] = \dfrac{1}{\mu}\begin{pmatrix}\mu^2 + (-v\lambda + (w-1)(\mu-1))\lambda & \lambda\\ -v\lambda + (w-1)(\mu-1) & 1\end{pmatrix} \quad \text{and, of course}\\
\mu = \det \underline{u}
\end{cases} \tag{46}$$

so we have, if $\zeta = \begin{pmatrix}A & B\\ C & D\end{pmatrix}$

$$B = \lambda/\mu, \quad D = 1/\mu \qquad \text{i.e.} \tag{47}$$

$$\mu = 1/D, \quad \lambda = B/D, \qquad \text{i.e.|of which } \underline{u} = \begin{pmatrix}1/D & B/D\\ 0 & 1\end{pmatrix} \tag{48}$$

[p. 453bis]

Likewise, if $\eta = \begin{pmatrix} R & S \\ T & U \end{pmatrix}$, we will have d1 d2

$$\begin{cases} S = B = \lambda/\mu, \quad U = D = 1/\mu & \text{whence} \\ \mu = 1/U, \quad \lambda = S/U \end{cases} \tag{47 bis}$$

so

$$\underline{u} = \begin{pmatrix} 1/U & S/U \\ 0 & 1 \end{pmatrix}. \tag{48 bis}$$

Let us now consider the equation

$$[\alpha, \rho] = [\beta, \sigma]\varepsilon_1(\mu - 1), \qquad \text{with} \tag{49}$$

$$\alpha = \begin{pmatrix} a & b \\ c & d \end{pmatrix}, \quad \beta = \begin{pmatrix} r & s \\ t & u \end{pmatrix}, \tag{50}$$

and set, for more elegant calculations

$$\rho = \begin{pmatrix} 0 & v_1 \\ v & w \end{pmatrix}, \quad \sigma = \begin{pmatrix} 0 & v_1' \\ v' & w' \end{pmatrix} \tag{51}$$

(we have written v_1, v_1' instead of u, u', so as not to interfere with the notation u for one of the coefficients of β), with

$$v' = -v, \quad v_1' = -v_1|v', \quad w + w' = v_1, \qquad \text{let us set} \tag{52}$$

$$\delta_\alpha = \det \alpha = ad - bc, \quad \delta_\beta = \det \beta = ru - st, \tag{53}$$

m991

Marginal note. m991 We do not set $v_1 = 1$, so as not to have to redo the same calculation for $[\beta, \sigma]$ as for $[\alpha, \rho]$!

we then find

$$\zeta = [\alpha, \rho] = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} 0 & v_1 \\ v & w \end{pmatrix} \frac{1}{\delta_\alpha} \begin{pmatrix} d & -b \\ -c & a \end{pmatrix} \frac{1}{-vv_1} \begin{pmatrix} w & -v_1 \\ -v & 0 \end{pmatrix}$$
$$= -\frac{1}{\delta_\alpha v v_1} \begin{pmatrix} bv & av_1 + bw \\ dv & cv_1 + dw \end{pmatrix} \begin{pmatrix} dw + bv & -dv_1 \\ -cw - av & cv_1 \end{pmatrix} = \begin{pmatrix} A & B \\ C & D \end{pmatrix}$$

with

$$\begin{cases} (-\delta_\alpha v v_1)A = \dots \quad \text{(a bore).}, & (-\delta_\alpha v v_1)B = -vv_1 bd + v_1^2 ac + v_1 wbc \\ (-\delta_\alpha v v_1)C = \dots \quad \text{(a bore)}, & (-\delta_\alpha v v_1)D = -vv_1 d^2 + v_1 wcd + v_1^2 c^2 \end{cases} \tag{54}$$

and we likewise find

$$\eta = (\beta, \sigma)|[\beta, \sigma] = \begin{pmatrix} R & S \\ T & U \end{pmatrix}$$

with

$$\begin{array}{ll} (-vv_1\delta_\beta)R = \dots & (-vv_1\delta_\beta)S = (v_1 v)su + v_1^2 tr - v_1 w' st \\ (-vv_1\delta_\beta)T = \dots & (-vv_1\delta_\beta)U = -(v_1 v)u^2 - v_1 w' tu + v_1^2 t^2. \end{array} \tag{55}$$

N.B. we can divide by v_1.

We deduce from this in particular d1

$$\begin{cases} D = \dfrac{-vd^2 + wcd + v_1 c^2}{-v(ad - bc)} \\ \mu = 1/D = \dfrac{-v(ad - bc)}{-vd^2 + wcd + v_1 c^2} \\ \lambda = B/D = \dfrac{-vbd + v_1 ac + wbc}{-vd^2 + wcd + v_1 c^2}. \end{cases} \tag{56}$$

which thus makes it possible to make explicit

$$\underline{u} = \begin{pmatrix} 1/D = \mu & B/D = \lambda \\ 0 & 1 \end{pmatrix}$$

in terms of a, b, c, d (and the parameters u_1, v, w which determine ρ).

For $v_1 = 1$, the formula for D in (56), can be written

$$D = \det(d\rho + c)/ - v\delta_\alpha = \det(d\rho + c)/\det\rho\det\alpha \tag{57}$$

d18

$$D(\alpha) \text{ invertible} \quad \Longleftrightarrow \quad d\rho + c \text{ invertible.} \tag{58}$$

but I realize that this is a flat form,

[p. 454]

V Study(of the equation)[i1] in $GP(1)$, and the condition $\operatorname{Tr}\sigma = 0$.

Up to now we have studied equation (32)

$$[\alpha, \rho] = [\beta, \sigma]\, \varepsilon_1(\mu - 1) \tag{*}$$

in G ($\simeq \mathrm{Gl}(2)$), or what amounts to the same, [d2] as a relation in $\mathrm{Sl}(2)$. Here α, β are [d3]variable[i2] sections of $G \simeq \mathrm{Gl}(2)$, but $[\alpha, \rho]$ and $[\beta, \sigma]$ depend only on the corresponding sections $\tilde{\alpha}, \tilde{\beta}$ of

$$PG\ (\simeq GP(1)) \simeq G/\underbrace{G_m}_{\text{Center of } G} \simeq \mathrm{Aut}_{1|l}(G)$$

(likewise they depend on ρ, σ only via $\tilde{\rho}, \tilde{\sigma}$). We can therefore consider that it is an equation in [d5] $SG \simeq \mathrm{Sl}(2)$,[i3] relating $\tilde{\alpha}, \tilde{\beta}, \mu$.

We can propose to study the corresponding equation in $PG \simeq GP(1)$,

$$[\tilde{\alpha}, \tilde{\rho}] = [\tilde{\beta}, \tilde{\sigma}] \cdot \tilde{\varepsilon}_1(\mu - 1) \tag{1}$$

which can also be written in $\mathrm{Gl}(2)$, in the equivalent form

$$[\alpha, \rho] = \varepsilon[\beta, \sigma]\, \varepsilon_1(\mu - 1), \tag{2}$$

where ε is a section of G_m, [d7]of[i4] [d8] course uniquely determined|determined by α, β, μ, (and even by $\tilde{\alpha}, \tilde{\beta}, \mu$)). We will necessarily have

$$\varepsilon^2 = 1 \tag{3}$$

(take the determinant of the two sides). We regard (2) as an equation relating the variables $\alpha, \beta, \mu, \varepsilon$ (α, β in Gl(2), μ, ε in $\mathbb{E}^1|\mathbb{E}'$ – and in fact necessarily in $\mathbb{G}_m|G_m$, and ε already in $\mu_2 = {}_2\mathbb{G}_m|G_m$), or also $\tilde{\alpha}, \tilde{\beta}, \mu, \varepsilon$. Let us put, [d1]by analogy with[i1] (II),

$$\zeta = [\alpha, \rho], \qquad \eta = \varepsilon[\underline{\underline{\beta}}, \sigma], \tag{4}$$

so that (2) takes the form

$$\zeta = \eta\varepsilon_1(\mu - 1) \tag{5}$$

as in (II). To be able to apply (II) to this situation, we will have to assume that $\eta = \varepsilon[\beta, \sigma]$ satisfies the same preliminary conditions as

$$\eta_0 = [\beta, \sigma]$$

itself, namely $\det \eta = 1$ ($\iff \varepsilon^2 = 1$) and [d4]

$$\underbrace{\mathrm{Tr}\,\eta}_{\varepsilon \mathrm{Tr}\,\eta_0 = \varepsilon \mathrm{Tr}\,\sigma} = \mathrm{Tr}\,\sigma$$

i.e.

$$\varepsilon \mathrm{Tr}\,\sigma = \mathrm{Tr}\,\sigma.$$

[p. 455]

Lemma. Let σ be a section of G (a form of Gl(2), associated|associated with an Azumaya algebra $\mathcal{M}|M$) – i.e. a section of $\mathcal{M}|M$ such that $\det \sigma$ invertible. [d1]Let A_σ be the scheme[i1] of sections η [d2] of G satisfying the conditions

$$\det \eta = 1 \quad \text{(i.e. } \eta \text{ in } SG\text{)}, \qquad \operatorname{Tr} \eta \circ \sigma = \operatorname{Tr} \sigma.$$

Equivalent conditions a) b) c) :

a) A_σ is stable under translations by $\mu_2 \subset \mathbb{G}_m|G_m$:

$$\eta \longmapsto \varepsilon\eta \qquad (\varepsilon^2 = 1)$$

b) $\operatorname{Tr} \sigma = 0$

[d3]

d)|c) (Under the conditions of the preceding number IV (page 452)[i2], with the normalizations (34) (38) for ρ, σ) We have

$$\sigma = \begin{pmatrix} 0 & -1 \\ v' & 0 \end{pmatrix} = \begin{pmatrix} 0 & -1 \\ -v & 0 \end{pmatrix} \tag{6}$$

i.e. (with the notation of loc. cit.) we have $w = 1$,

$$\text{i.e.} \qquad \rho = \begin{pmatrix} 0 & 1 \\ v & 1 \end{pmatrix}. \tag{7}$$

d) We have $\sigma^2 \in \Gamma\mathbb{G}_m|G_m$, i.e. $\tilde{\sigma}^2 = 1$[i3]

Finally, these conditions imply the following d), and are equivalent to it|them if σ [d4] is not a homothety on any fiber (thus i.e. σ is regular in the sense of Steinberg).[i4]

[d5]The equivalence $a) \iff b)$ means also|thus[i5] that $\mathbb{E}^1|\mathbb{E}'^{\mu_2} = (0)$, which is well known and immediate to verify. The equivalence of b) and d) is immediate, remains to prove $b) \iff c)$. [d6] Now we have the equation of|of Hamilt-Cayley|Hamilton-Cayley[i6]

$$\sigma^2 - (\operatorname{Tr} \sigma)\sigma + \det \sigma = 0$$

Now|We we have, via the isomorphism

$$B_0' \xrightarrow{\sim} \mathcal{X}_{\rho,\sigma}$$

a privileged solution $\alpha = \underline{u}$ of the first equation (15), which is characterized as the unique solution which is [d1] section of B_0' (uniqueness resulting from

$$T_\alpha \cap B_0' = \{1\}$$

). But we will have, for this u

$$\underbrace{u\sigma(u)^{-1}}_{[u,\sigma]} = \eta \qquad \text{(and not } \varepsilon\eta \text{ !)}$$

to find in terms of u a solution of the equation (15 b)[i1] $\beta\sigma(\beta)^{-1} = \varepsilon\eta$, we are led to try in the form

$$\beta = u\tau \quad \text{whence} \quad \beta\sigma(\beta)^{-1} = u\tau\sigma(\tau)^{-1}\sigma(u)^{-1}, \tag{16}$$

trying to determine τ so that we have

$$\underbrace{\tau\sigma(\tau)^{-1}}_{[\tau,\sigma]} = \varepsilon, \tag{17}$$

which indeed implies

$$\beta\sigma(\beta)^{-1} = u\varepsilon\sigma(u^{-1}) = \varepsilon u\sigma(u)^{-1} = \varepsilon\eta$$

i.e. (15 b). [d9]

[p. 457] The relation (17) can also be written

(take the inverse)

$$\tau\sigma\tau^{-1}\sigma^{-1} = \varepsilon \quad \text{or} \quad \sigma\tau\sigma^{-1}\tau^{-1} = \varepsilon \quad \text{or} \tag{18}$$

$$\sigma = \varepsilon\tau(\sigma) \quad \text{or} \quad \tau(\sigma) = \varepsilon\sigma \tag{19}$$

which implies that τ normalizes T_σ

$$\tau(T_\sigma) = T_\sigma \quad \text{i.e.} \quad \tau \in \Gamma N_\sigma \tag{20}$$

where

$$N_\sigma \overset{\text{definition}}{=} \mathrm{Norm}_G(T_\sigma). \tag{21}$$

Corollary to the lemma (page 455) the equivalent[i1] conditions of the lemma [d2] are implied[i2] [d3] by the[i3] following ; and imply it if σ is regular|regular :[i4]

(e) $\forall$ fppf local[i5] section ε of μ_2, exists local[ly]|locally[i6] section [d4] τ of G such that we have (17) (or again (19))

(f) (If 2 invertible on S) idem, with $\varepsilon = -1$.

If we have (e), then we see that for every [d5] ε, we must have $\mathrm{Tr}\,\varepsilon\sigma = \mathrm{Tr}\,\sigma$ now $\mathrm{Tr}\,\varepsilon\sigma = \varepsilon\,\mathrm{Tr}\,\sigma$, hence (varying ε)[i7] $\mathrm{Tr}\,\sigma \in \Gamma(\mathbb{E}^1|\mathbb{E}'^{\mu_2} = 0)$ hence $\mathrm{Tr}\,\sigma = 0$. If we assume it only for $\varepsilon = -1$, we will have $\mathrm{Tr}\,\sigma = -\mathrm{Tr}\,\sigma$ i.e. $2\,\mathrm{Tr}\,\sigma = 0$, i.e. $\mathrm{Tr}\,\sigma = 0$ if 2 invertible. Conversely, let us assume $\mathrm{Tr}\,\sigma = 0$, then $\mathrm{Tr}\,\varepsilon\sigma = 0$, moreover $\det(\varepsilon) = \varepsilon^2 = 1$, hence ε satisfies the "numerical conditions" to be of the form $[\tau, \sigma]$ for suitable τ. For

[scan 315]

ensure the local existence of τ, it remains to make sure that $\varepsilon\sigma$ is a regular section in the sense of Steinberg i.e. is nowhere a scalar, which follows from the fact that this is so for σ.

Thus, under the present conditions, let $N'_\sigma \subset N_\sigma$ be the subscheme of [d1] G (or of $N_\sigma|N$) defined by

$$N'_\sigma = \{\tau \mid [\tau, \sigma] \in \Gamma\mu_2\} \tag{22}$$

then N'_σ is stable under right translation by T_σ — better, it is a subgroup scheme of N_σ (containing T_σ)[i1], for if τ, τ' are such that

$$\tau(\sigma) = \varepsilon\sigma, \qquad \tau'\sigma = \varepsilon'\sigma,$$

we will have

$$\tau'\tau(\sigma) = \varepsilon'\varepsilon \cdot \sigma,$$

at the same time we see that

$$\tau \longmapsto \varepsilon$$

is a group homomorphism $N'_\sigma \longrightarrow \mu_2$, and we will have an exact sequence of group schemes

$$1 \longrightarrow T_\sigma \hookrightarrow N'_\sigma \xrightarrow{\varepsilon_\sigma} \mu_2 \longrightarrow 1. \tag{23}$$

We will note that if $\tau \in \Gamma G$ normalizes T_σ, we will have

$$\tau(\sigma) = a\sigma + b \qquad a, b \in \Gamma\mathcal{O}_S,$$

[scan 316]

[p. 458|488] and taking the traces of the two sides we find (taking into account that $\operatorname{Tr}\tau(\sigma) = \operatorname{Tr}\sigma = 0$) $\operatorname{Tr} b.1 = 0$ i.e. $2b = 0$, so if b is invertible $b = 0$, hence $\tau(\sigma) = a\sigma$ and we necessarily have $a^2 = 1$ i.e. a is an ε. Thus

$$N'_\sigma = N_\sigma \quad \text{in residual characteristic } \neq 2. \tag{24}$$

d1 More generally, over a base S such that 2 d2 be d3 a regular section[i1] (i.e. not a zero divisor) in $\Gamma(S, \mathcal{O}_S)$, we see that every section of $N'_\sigma | N_\sigma$ is in fact a section of N_σ. But this is no longer so in characteristic 2, for

$$\sigma' = a\sigma + b \qquad (a \in \Gamma G_m,\ b \in \Gamma\mathcal{O}_S)$$

as soon as it satisfies

$$\operatorname{Tr}\sigma' = \sigma|0, \quad \det\sigma' = \det\sigma$$

is conjugate local[ly] to σ — and d4 the conditions[i2] are written (since $\det(a\sigma + b) = a^2 \det\sigma + ab\underbrace{\operatorname{Tr}\sigma}_{0} + b^2$

$$\begin{cases} -va^2 + b^2 = -v \\ 2b = 0 \qquad \text{(automatic in characteristic 2)} \end{cases}$$

which in no way imply $b = 0$ ....

d6 Let us now consider the product group

$$B'_0 \times A_\rho \times N'_\sigma,$$

and the morphism of schemes

$$\begin{cases} B'_0 \times A_\rho \times N'_\sigma \longrightarrow G \times G \times \mathbb{E}^1|\mathbb{E}' \times \mathbb{E}^1|\mathbb{E}' \\ \qquad (\underline{u}, \underline{a}, \underline{b}) \longmapsto (\alpha = \underline{u}\underline{a}^{-1}, \beta = \underline{u}\underline{b}^{-1}, \mu = \det \underline{u}, \varepsilon = \varepsilon_\sigma(\underline{b})), \end{cases} \tag{25}$$

I say that the image lies in $\mathcal{G}^*_{\rho,\sigma}$, i.e. that we will indeed have

$$\alpha\rho(\alpha)^{-1} = \varepsilon(\beta\sigma(\beta)^{-1})\varepsilon_1(\mu - 1). \tag{$*$}$$

Indeed

$$\begin{aligned} \alpha\rho(\alpha)^{-1} &= \underline{u}\rho(\underline{u})^{-1} \\ \beta\rho(\beta)^{-1} &= \underline{u}\underbrace{\underline{b}^{-1}\sigma(\underline{b}^{-1})^{-1}}_{\varepsilon_\sigma(\underline{b})^{-1} = \varepsilon_\sigma(\underline{b})}\sigma(\underline{u})^{-1} = \varepsilon\underline{u}\sigma(\underline{u})^{-1} \end{aligned}$$

and we know (by II) that

$$\underline{u}\rho(\underline{u})^{-1} = \underline{u}\sigma(\underline{u})^{-1}\varepsilon_1(\mu - 1)$$

hence ($*$), since $\varepsilon^2 = 1$. But moreover the morphism (25) is a monomorphism, [d2] for in terms of $(\alpha, \beta, \mu, \varepsilon)$, u is determined (in terms of α already)[i2], (as the unique section of B'_0 which is of the form $\alpha\underline{a}^{-1}$, with $\underline{a} \in \Gamma T_\rho$ (for $T_\rho \cap B'_0 = \{1\}$)), and $\underline{b}$ is then determined by the relation $\beta = \underline{u}\underline{b}^{-1}$. We thus find that (25) is an isomorphism

$$\begin{cases} B'_0 \times A_\rho \times N'_\sigma \xrightarrow{\sim} \mathcal{G}^*_{\rho,\sigma} \\ \qquad (\underline{u}, \underline{a}, \underline{b}) \longmapsto (\alpha = \underline{u}\underline{a}^{-1}, \beta = \underline{u}\underline{b}^{-1}, \mu = \det \underline{u}, \varepsilon = \varepsilon_\sigma(\underline{b})) \end{cases} \tag{26}$$

[p. 459]

If we have two sections $(\underline{u}, \underline{a}, \underline{b})$ and $(\underline{u}', \underline{a}', \underline{b}')$ of $B'_0 \times T_\rho \times N'_\sigma$, under what conditions do we have

$$\tilde{\alpha} = \tilde{\alpha}', \quad \tilde{\beta} = \tilde{\beta}' \ ? \tag{27}$$ (27)

It clearly suffices to have

$$\underline{a}' = \lambda_1 \underline{a}, \qquad \underline{b}' = \lambda_2 \underline{b} \qquad \lambda_1, \lambda_2 \in \Gamma G_{\mathrm{m}} \tag{28}$$

and I say that these conditions are also necessary. This comes from the fact that $B'_0 \hookrightarrow PG \simeq GP(1)$ is a monomorphism (let $\widetilde{B}'_0$ be the image of B'_0), that [d1] $A_\rho \to PG$ and $N'_\sigma \longrightarrow PG$ have kernel G_{m} (let|let $\tilde{T}_\rho$ and $\widetilde{N}'_\sigma$ be their images), and that we have in PG

$$\tilde{T}_\rho \cap \widetilde{B}'_0 = \{1\}, \tag{29}$$

so that [d2] $\underline{\tilde{u}} \in \Gamma \widetilde{B}'_0$ and $\underline{\tilde{a}} \in \Gamma \widetilde{A}_\rho$ [i1] are defined uniquely in terms of $\tilde{\alpha}$ by the relation

$$\tilde{\alpha} = \underline{\tilde{u}\tilde{a}}^{-1}$$

– and that then $\underline{\tilde{b}}$ is defined in terms of $\tilde{\alpha}, \tilde{\beta}$ [i2] by the relation

$$\tilde{\beta} = \underline{\tilde{u}\tilde{b}}^{-1}.$$

This shows that [d4] we have an isomorphism

$$\begin{cases} \widetilde{B}'_0 \times \widetilde{A}_\rho \times \widetilde{N}'_\sigma \xrightarrow{\sim} \widetilde{\mathcal{G}}^*_{\rho,\sigma} \subset PG \times PG \times \mathbb{E}^1|\mathbb{E}' \\ \qquad (\underline{\tilde{u}}, \underline{\tilde{a}}, \underline{\tilde{b}}) \longmapsto (\underline{\tilde{u}\tilde{a}}^{-1}, \underline{\tilde{u}\tilde{b}}^{-1}, \delta(\underline{\tilde{u}})) \end{cases} \tag{30}$$

where

$$\delta(\underline{\widetilde{u}}) = \det(\underline{u}) \tag{31}$$

when $\underline{\widetilde{u}}$ comes from $\underline{u} \in \Gamma B_0'$ – or, what amounts to the same (cf. page 441) $\delta(\underline{\widetilde{u}})$ is defined by

$$\underline{\widetilde{u}}(N_0) = \delta(\underline{\widetilde{u}}) N_0. \tag{32}$$

m995

Marginal note. m995 N.B. The centralizer of $\widetilde{\sigma}$ in $\widetilde{G} = PG$ is not $\widetilde{T}_\sigma$, but $\widetilde{N}'_\sigma$ d1.

Remark. Let us note that a section $(\tilde{\alpha}, \tilde{\beta}, \mu)$ d2 of $\widetilde{\mathcal{G}}^*_{\rho,\sigma}$ remains d3 determined, modulo the action of $\widetilde{N}'_\sigma$ on βi1, to be precise, in terms of $\tilde{\alpha}$ – condition|conditions to be satisfied by $\tilde{\alpha}$, so that there exist $\tilde{\beta}, \mu$ d4 which complete it to a section of $\widetilde{\mathcal{G}}^*_{\rho,\sigma}$, being the following: the coefficient D of $\zeta = \alpha\rho(\alpha)^{-1} = \begin{pmatrix} A & B \\ C & D \end{pmatrix}$ is invertible (which makes it possible to determine μ by $\mu = 1/D$), then we determine $\tilde{\eta}$ d5 by $\tilde{\eta} = \tilde{\zeta}\tilde{\varepsilon}_1(\mu - 1)$, and finally we find the^{i2} $\tilde{\beta}$ that correspond^{i3} by the condition

$$\tilde{\beta}\tilde{\sigma}(\tilde{\beta})^{-1} = \tilde{\eta}.$$

m996

Marginal note. m996 N.B. $\tilde{\alpha}$ depends on three parameters, while $\widetilde{\mathcal{G}}^*_{\rho,\sigma}$ is of|admits relative dimension $4 = 2+1+1$ (for $\widetilde{\mathcal{G}}^*_{\rho,\sigma} \simeq \widetilde{B}'_0 \times \widetilde{T}_\rho \times \widetilde{N}'_\sigma$).

m997

Marginal note. m997 N.B. We have lifted locally^t $\widetilde{\alpha}$ to $\alpha \in \Gamma G$, ζ does not depend on the choice of lifting.

Likewise, a section $(\alpha, \beta, \mu, \varepsilon)$ of $\mathcal{G}^*_{\rho,\sigma}$ i4 is determined by d6 d7 α alone^{i5} modulo d8 N'_σ – we first find $\underline{u}, \underline{a}$ in terms

[scan 320]

[p. 460]

of α as above, hence $\mu = \det \underline{u}$, hence and it [d1] [d2] remains to determine β as $\beta = \underline{u}\underline{b}^{-1}$, with $\underline{b} \in \Gamma N'_\sigma$ arbitrary, ε being defined then in terms of the choice of $\underline{b}$ as being $\varepsilon_\sigma(\underline{b})$. The condition for fixed $\alpha_0|\alpha$ to be completable by $(\beta, \mu, \varepsilon)$ to $(\alpha, \beta, \mu, \varepsilon) \in \Gamma \mathcal{G}^{\alpha|*}_{\rho,\sigma}$, is always the condition that the coefficient D [d3]

$$\zeta = \alpha\rho(\alpha)^{-1} = \begin{pmatrix} A & B \\ C & D \end{pmatrix} \tag{33}$$

be invertible, which makes it possible to[i1] will determine|determine μ by

$$\mu = 1/D. \tag{34}$$

Let us put

$$\alpha = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \tag{35}$$

and make $\alpha\rho(\alpha)^{-1}$ explicit; with $\rho = \begin{pmatrix} 0 & 1 \\ v & 1 \end{pmatrix}$ $\delta = \det \alpha = ad - bc$

$$\begin{aligned} \alpha\rho(\alpha)^{-1} &= \begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} 0 & 1 \\ v & 1 \end{pmatrix} \frac{1}{\delta} \begin{pmatrix} d & -b \\ -c & a \end{pmatrix} \begin{pmatrix} -\frac{1}{v} \end{pmatrix} \begin{pmatrix} 1 & -1 \\ -v & 0 \end{pmatrix} \\ &= -\frac{1}{\delta v} \begin{pmatrix} bv & a+b \\ dv & c+d \end{pmatrix} \begin{pmatrix} d+bv & -d \\ -c-av & c \end{pmatrix}, \end{aligned}$$

hence

$$\begin{cases} (-\delta v)A = vb(d + vb|bv) - (a+b)(c+va) & (-\delta v)B = -vbd + c(a+b) \\ (-\delta v)C = vd(d+vb) - (c+d)(c+va) & (-\delta v)D = -vd^2 + cd + c^2, \end{cases} \tag{36}$$

the most essential quantity thus being

$$\begin{cases} (-\delta v)D = -vd^2 + cd + c^2 = \det(d\rho + c), \\ \text{where} \\ \qquad \begin{cases} \delta = \det \alpha = ad - bc, \\ v \text{ the parameter|coefficient which defines} \\ \rho = \begin{pmatrix} 0 & 1 \\ v & 1 \end{pmatrix} \end{cases} \end{cases} \tag{37}$$

Scans 321–339

[scan 321]

and we have

$$(38) \qquad (-\delta v|\nu)B = ac + bc - v|\nu bd$$

which gives $\underline{u}$ again in terms of a, b, c, d, thanks to the formula $\overline{\text{IV}}(48)$ (page 453′)

$$(39) \qquad \underline{u} = \begin{pmatrix} \frac{1}{D} & B/D \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} \frac{-v|\nu(ad-bc)}{-v|\nu d^2 + cd + d^2} & \frac{-ac+bc-v|\nu bd}{-v|\nu d|a^2 + cd + d^2} \\ 0 & 1 \end{pmatrix}.$$

Remark. On the other hand, the datum of β alone[i2] (without the "sign" ε)[i3] does not allow one to recover μ. But the datum of (β, ε) does, for from it one deduces the knowledge of

$$(40) \qquad \eta = \varepsilon\beta\sigma(\beta)^{-1} \overset{\text{dfn}}{=} \begin{pmatrix} R & S \\ T & U \end{pmatrix},$$

which will be related to $\zeta = \alpha\rho(\alpha)^{-1}$ by

$$\zeta = \eta\varepsilon_1(\mu - 1)$$

and by the theory of the|of (II) we will have

$$(41) \qquad \mu = 1/U$$

(but in terms of $\beta\sigma(\beta)^{-1} \overset{\text{dfn}}{=} \begin{pmatrix} R_0 & S_0 \\ T_0 & U_0 \end{pmatrix}$, we will have [d2])

$$(42) \qquad \mu = \frac{\varepsilon}{U_0} \qquad)$$

i.e. it is a priori[i4] not known from U_0 alone, but only via U_0 and ε. [d3]

To make this point precise, we are going to look at when and[i5] how, for fixed (β, ε), one can complete with α, μ so as to have a [p. 320]

[p. 461] section $(\alpha, \beta, \mu, \varepsilon)$ of $\mathcal{G}^*_{\rho,\sigma}$. A necessary condition is that U_0 be invertible (it depends only on β, not on ε) — and then one can choose ε arbitrarily in $\Gamma\mu_2$, [d1]$\varepsilon \in \Gamma\mu_2$[i1] $\eta = \varepsilon\beta\sigma(\beta)^{-1}$ will then be a section of the subscheme[i2] A_σ [d2] of G of solutions of $\det\eta = 1$, $\operatorname{Tr}\eta\sigma = \operatorname{Tr}\sigma$ (cf. lemma page 455), hence by the theory of (II), for [d3] $\mu = 1/U = \varepsilon/U_0$, [d4] and defining

$$\zeta = \eta\varepsilon_1(\mu - 1),$$

ζ will indeed be expressible locally[i3] in the form $\alpha\rho(\alpha)^{-1}$, the indeterminacy being moreover in T_ρ via $\alpha \longmapsto \alpha' = \alpha\underline{b}$, $\underline{b} \in \Gamma T_\rho$.

This does show that μ can thereof|not take, for a fixed β, all the values ε/U_0, where $\beta\sigma(\beta)^{-1} = \begin{pmatrix} R_0 & S_0|C_0 \\ T_0 & U_0 \end{pmatrix}$ ...[p. 321]

[scan 323]

[p. 462]

(VI) Characterization of the|of the modular triple $(\varepsilon_1, \rho, \sigma)$.

1°) Let G, SG, PG be associated forms of $\mathrm{Gl}(2), \mathrm{Sl}(2), \mathrm{GP}(1)$ over a base S — thus corresponding: a torsor under $\mathrm{GP}(1)_S$, or again: a bundle of projective lines P[i1] over S, or an Azumaya Algebra M of rank 1|4, and let us consider two sections [illeg. 1][i2] $\tilde{\rho}, \tilde{\sigma}$ of PG, such that

$$(1) \qquad a) \quad \tilde{\varepsilon}_1 = \tilde{\rho}\tilde{\sigma}^{-1}$$

be [d1] a regular unipotent section, and that the section

$$(2) \qquad \tilde{\varepsilon}_0 \overset{\text{dfn}}{=} \tilde{\rho}^{-1}(\tilde{\varepsilon}_1) = \tilde{\sigma}^{-1}(\tilde{\varepsilon}_1)$$

which is deduced from it be [d2] in each fiber[i3] inequivalent to $\tilde{\varepsilon}_0$ (i.e. that the sections x_0, x_1 of P which correspond to $\varepsilon_0, \varepsilon_1$ be [d3] distinct in each fiber).

m999

Marginal note. [m999] N.B. If $\varepsilon_0, \varepsilon_1$ are the canonical liftings of $\tilde{\varepsilon}_0, \tilde{\varepsilon}_1$ into $G|P$, regular, with $\widetilde{\sigma}(\varepsilon_0) = \tilde{\rho}(\varepsilon_0) = \varepsilon_1 | \widetilde{\sigma}(\tilde{\varepsilon}_0) = \tilde{\rho}(\tilde{\varepsilon}_0) = \tilde{\varepsilon}_1$[i4] one can lift $\tilde{\rho}, \widetilde{\sigma}$ in a unique way to ρ, σ so as to satisfy $-\sigma^{-1}\rho = \varepsilon_0 \quad (\Longleftrightarrow -\rho\sigma^{-1} = \varepsilon_1)$, $(\rho + \sigma)^2 = (\rho + \sigma)$.

Then there exists a unique* pinning

$$(3) \qquad \mathrm{Gl}(2)_S \xrightarrow[\sim]{\varphi} G$$

and sections $v|\nu, w|\omega, v|\nu', w|\omega'$ of $\mathcal{O}_S$, satisfying

$$(4) \qquad v|\nu + v|\nu' = 0, \qquad w|\omega + w|\omega' = 1, \qquad v|\nu \in \Gamma\mathcal{O}_S^*$$

such that $\tilde{\rho}, \tilde{\sigma}$ are the images, under the composite $\mathrm{Gl}(2)_S \xrightarrow[\sim]{\varphi} G \longrightarrow PG$, of the sections

$$(5) \qquad \rho = \begin{pmatrix} 0 & 1 \\ v|\nu & w|\omega \end{pmatrix}, \qquad \sigma = \begin{pmatrix} 0 & -1 \\ v|\nu' & w|\omega' \end{pmatrix}$$

m1000

Marginal note. [m1000] N.B.* Uniqueness of $v|\nu, w|\omega$ (i.e. of ρ_0, σ_0)[i5] is not true without some restrictions on S, it suffices that every section τ of $\mathcal{O}_S$ such that $2\tau = 0,\ \tau^2 = 0$ be zero.

[scan 325]

[p. 463] 2°) The following conditions are equivalent

(12)
$$\left\{\begin{array}{ccccc} \boxed{\operatorname{Tr}\sigma = 0} & \Longleftrightarrow & \operatorname{Tr}\rho = 1 & \Longleftrightarrow & \boxed{\tilde{\sigma}^2 = 1} \\ \Updownarrow & & \Updownarrow & & \Updownarrow \\ \boxed{w|\omega' = 0} & & \boxed{w|\omega = 1} & & \sigma^2 \in \Gamma\mathbf{G}_m \\ & & & & \Updownarrow \\ & & & & \boxed{\sigma^2 = v|\nu\,\mathrm{id}.} \end{array}\right.$$

They are also equivalent to this: denoting by N'_σ the subgroup scheme of Gl(2) defined by the condition

$$\tau(\tilde{\sigma}) = \tilde{\sigma} \quad \text{i.e.} \quad \tau(\sigma) = \varepsilon\sigma, \quad \varepsilon \in \Gamma\mathbf{G}_m \tag{13}$$

(we will necessarily have $\varepsilon^2 = 1$ i.e. $\varepsilon \in \Gamma\mu_2$) the morphism

$$\begin{array}{c} N'_\sigma \longrightarrow \mu_2 \\ \tau \longmapsto \varepsilon \end{array} \tag{14}$$

is an epimorphism — so that we will have an exact sequence

$$1 \longrightarrow T_\sigma \longrightarrow N'_\sigma \longrightarrow \mu_2 \longrightarrow 1, \tag{15}$$

where [d2]

$$T_\sigma = \operatorname{Centr}_{\mathrm{Gl}(2)_S}(\sigma) = \{t\sigma + u \mid \det(t\sigma + u) \text{ invertible}\} \tag{16}$$

$$\text{We have} \quad N'_\sigma \subset N_\sigma \overset{\text{dfn}}{=} \operatorname{Norm}_{\mathrm{Gl}(2)}(T_\sigma). \tag{17}$$

If 2 is a regular section of $\mathcal{O}_S$, then every section of N_σ over S[i1] is a section of N'_σ — thus if|in the[i2] residue characteristics are|is $\neq 2$ i.e. 2 invertible, we will have

$$N'_\sigma = N_\sigma \qquad (\text{residue characteristics } \neq 2). \tag{18}$$

The condition under consideration means that σ, ρ take the form [p. 324]

$$(19) \qquad \sigma = \begin{pmatrix} 0 & -1 \\ v|\nu' & 0 \\ \| & \\ -v|\nu & \end{pmatrix}, \qquad \rho = \begin{pmatrix} 0 & 1 \\ v|\nu & 1 \end{pmatrix}$$

with $v|\nu + v|\nu' = 0$.

These results of 1°), 2°) are only a recapitulation of part of the results of the preceding sections IV, V. [d1], we have just studied conditions which amount to the determination the value of|the values of[i1] $w|\omega$ (or again of[i2] $w|\omega'$) in a [d2] explicit way. We are going to turn to conditions which are to|will serve to fix $v|\nu$ (or again $v|\nu'$) in an explicit way.

3°) Equivalent conditions

$$(20) \qquad \begin{cases} \det\sigma = 1 \iff \det\rho = 1 \iff v|\nu = -1 \iff v|\nu' = 1 \\ \qquad\qquad \iff \varepsilon_0 = \begin{pmatrix} 1 & -1 \\ 0 & 1 \end{pmatrix}. \end{cases}$$

These equivalences follow at once from (6) and (11).|! The conditions also mean that ρ and σ have the form

$$(21) \qquad \sigma = \begin{pmatrix} 0 & -1 \\ 1 & w|\omega' \end{pmatrix}, \qquad \rho = \begin{pmatrix} 0 & 1 \\ -1 & w|\omega \end{pmatrix}$$

$$(w|\omega + w|\omega' = 1)$$

4°) Conjunction of 2°) and 3°).

Equivalent conditions: [p. 325]

m1001

Marginal note. m1001

cf. corollary 2 below

Proof. The fact that the conjunction of the conditions of 2°) and 3°) is equivalent to each of the conditions of the 2^e and 3^e rows, is trivial. The equivalence with $\sigma^2=-1$ comes from the fact that [d2] the condition 2° means that σ^2 be|is scalar, i.e.[i1] $\sigma^2=v|\nu\,\mathrm{id}$, [d3] whereas 3° means $v|\nu=-1$, so $\sigma^2=-1$ is indeed equivalent to the conjunction.

m1002

Marginal note. m1002 for another proof of the equivalence of $2^\circ)+3^\circ)$ with $\tilde{\sigma}^2=\tilde{\rho}^3=1$, cf. lemma below

Let us note that 2°) is also written $\tilde{\sigma}^2=1$, and is equivalent to: $w|\omega'=0$, i.e. $w|\omega=1$, and we then find, writing [d4]

$$\rho=\begin{pmatrix}0&1\\v|\nu&1\end{pmatrix},$$

$$(23)\qquad \rho^3=\begin{pmatrix}v|\nu & v|\nu+1\\ v|\nu(v|\nu+1) & 2v|\nu+1\end{pmatrix}$$

thus ρ^3 can be a scalar i.e. $\tilde{\rho}^3=1$ only if the two diagonal terms are equal, now their difference is $(2v|\nu+1)-v|\nu=v|\nu+1$,

[p. 326]

[scan 328]

so the condition reads $v|\nu = -1$, i.e. this is condition 3°, but then the expression (23) for ρ^3 shows us that $\rho^3 = -1$.

Remarks|Remark The preceding conditions imply the formulas

$$(24) \qquad \varepsilon_0 = \sigma\rho$$
$$(25) \qquad \varepsilon_1 = \rho\sigma$$
$$(26) \qquad \rho\varepsilon_1 = \varepsilon_0^{-1}$$
$$(27) \qquad \rho^2\sigma = \varepsilon_0^{-1}$$

each of which except the last (27)[i1] implies them in turn — for example we have $\varepsilon_0 = -\sigma^{-1}\rho$ (7)[i2], so (24) is equivalent to $\sigma = -\sigma^{-1}$ i.e.[i3] $\sigma^2 = -1$, and (25) is equivalent to (24) by applying $\mathrm{int}(\rho)$ to both sides.

We have moreover

$$\rho\varepsilon_1 = \begin{pmatrix} 0 & 1 \\ v|\nu & w|\omega \end{pmatrix}\begin{pmatrix} 1 & 0 \\ 1 & 1 \end{pmatrix} = \begin{pmatrix} 1 & 1 \\ v|\nu + w|\omega & w|\omega' | w|\omega \end{pmatrix}, \qquad \varepsilon_0^{-1} = \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix}$$

which shows that $\rho\varepsilon_1 = \varepsilon_0^{-1}$ is equivalent to:

$$w|\omega = 1, \quad v|\nu + w|\omega = 0 \qquad \text{i.e.} \quad w|\omega = 1, v|\nu = -1 \quad \text{i.e.} \quad \rho = \begin{pmatrix} 0 & 1 \\ -1 & 1 \end{pmatrix},$$

OK. Composing (25) (in the form $\rho\varepsilon_1 = \rho^2\sigma$)[i4] and (26) we find (27) as a consequence of the conditions 2°)+3°); [d1]Let us try to prove[i5] converse implication [d2]by[i6] [d3] a brute-force calculation

$$\rho^2\sigma = \begin{pmatrix} -v|\nu w|\omega & w|\omega - (v|\nu + w|\omega^2) \\ -v|\nu(v|\nu + w|\omega^2) & -w|\omega(w|\omega^2 + 2v|\nu) + v|\nu - w|\omega^2 \\ & | - w|\omega(w|\omega^2 + 2v|\nu) + v|\nu + w|\omega^2 \end{pmatrix},$$

$$\varepsilon_0^{-1} = \begin{pmatrix} 1 & -1/v|\nu \\ 0 & 1 \end{pmatrix}$$

[d5] we can have the equality $\rho^2\sigma = -\varepsilon_0^{-1}|\varepsilon_0^{-1}$ only if $-v|\nu(v|\nu + w|\omega^2) = 0$, this implies|which implies ($v|\nu$ invertible!) $v|\nu + w|\omega^2 = 0$, [d6]i.e. $v|\nu = -w|\omega^{2}$[i7],

Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

[scan 329]

[p. 465]

$$\rho^2\sigma = \begin{pmatrix} w|\omega^3 & w|\omega \\ 0 & w|\omega^3 \end{pmatrix},$$

This shows that [d2]

$v|\nu = -w|\omega^2$
[d4] i.e. $v|\nu = -1, w|\omega = 1$

$$\text{(27bis)} \qquad \rho^2\sigma = \varepsilon_0^{-1} \iff \left\{ v|\nu + w|\omega^2 = 0,\ w|\omega^3 = 1 \right.$$

$$\left(\Rightarrow v|\nu = -w|\omega^2 = -1/w|\omega \text{ i.e. } w|\omega = -1/v|\nu,\ \text{OK} \right)$$

i2

But (27), on multiplying by ρ, is also equivalent to

$$\rho^3\sigma = \rho\varepsilon_0^{-1}$$

now we know that $\varepsilon_0 = -\sigma^{-1}\rho$ (7)[i3] i.e. $\varepsilon_0^{-1} = -\rho^{-1}\sigma|\sigma_0$ i.e. $\rho\varepsilon_0^{-1} = -\sigma$, so the preceding relation also reads $\rho^3\sigma = -\sigma$ or again

$$(28) \qquad \boxed{\rho^3 = -1}.$$

We can see [d8] the equivalence [d9]of (28) with the conditions (27bis)[i4] by computing ρ^3 in terms of $v|\nu, w|\omega$, we find

$$(29) \qquad \rho^3 = \begin{pmatrix} v|\nu w|\omega & v|\nu + w|\omega^2 \\ v|\nu(v|\nu + w|\omega^2) & w|\omega(2v|\nu + w|\omega^2) \end{pmatrix}$$

And we can have $\tilde{\rho}^3 = 1$ i.e. ρ^3 a scalar only if [d10]

$$v|\nu + w|\omega^2 = 0 \qquad \text{i.e.} \quad v|\nu = -w|\omega^2$$

which implies

$$\rho^3 = \begin{pmatrix} -w|\omega^3 & 0 \\ 0 & -w|\omega^3 \end{pmatrix}$$

i.e. we find

Lemma We have $\tilde{\rho}^3 = 1$ iff $v|\nu + w|\omega^2 = 0$ i.e. $v|\nu = -w|\omega^2$ i.e. we have

$$(30) \qquad \rho = \begin{pmatrix} 0 & 1 \\ -w|\omega^2 & w|\omega \end{pmatrix},$$

and then we have

$$(31) \qquad \rho^3 = -w|\omega^3 \cdot 1\ ,$$

so we have

$$(32) \qquad \rho^3 = -1 \iff \begin{array}{c} w|\omega^3 = 1 \text{ i.e. } w|\omega \in \Gamma\mu_3 \\ \underline{\text{and}} \quad v|\nu = -w|\omega^2\ (= -1/w|\omega) \end{array}$$

Corollary 1 The equivalent conditions (22) are also equivalent to

$$(33) \qquad \rho^3 = -1 \quad \text{and} \quad \det\rho = 1$$

or again to

$$(34) \qquad \rho^3 = -1 \quad \text{and} \quad \mathrm{Tr}\rho = 1$$

in other words, considering the three relations

$$(35) \qquad \det\rho = 1, \quad \mathrm{Tr}\,\rho = 1, \quad \rho^3 = -1$$

the conjunction of[i2] two of these imply|implies the third, and is equivalent to the equivalent conditions of (22). false

Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

140-3-s330-D002 *deletion. Manuscript:* Let us note another way of finding this corollary, by noting that

$$(36|30) \qquad \rho^3+1=(\rho+1)(\rho^2-\rho+1) \qquad \text{(algebraic identity)}$$

now ρ not being a scalar on any fiber, $\rho+1$ is invertible, so $\rho^3=-1$ i.e. $\rho^3+1=0$ is equivalent to the relation $\rho^2-\rho+1=0$:

$$(36) \qquad \rho^2-\rho+1=0\ ; \quad (\Longleftrightarrow \rho^3=-1),$$

which we compare with Hamilton–Cayley

$$(37) \qquad \rho^2-\underbrace{(\operatorname{Tr}\rho)}_{w|\omega}\rho+\underbrace{\det\rho}_{-v|\nu}=0,$$

so $w|\omega=1, v|\nu=-1$ $\operatorname{Tr}\rho=\det\rho=1$ implies (36), so $\rho^3=-1$ on the other hand if we have (36), we conclude via 37

$$(\operatorname{Tr}(\rho)-1)\rho=|\neq \det(\det\rho-1)1$$

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 331]

[p. 466]

Another way of finding certain equivalences is via the Hamilton–Cayley equations for σ and ρ

$$(36) \qquad \sigma^2-\underbrace{(\operatorname{Tr}\sigma)}_{w|\omega'=1-w|\omega}\sigma+\underbrace{\det\sigma}_{v|\nu'=-v|\nu}=0$$

$$(37) \qquad \rho^2-\underbrace{(\operatorname{Tr}\rho)}_{w|\omega}\rho+\underbrace{\det\rho}_{-v|\nu}=0.$$

Equation (36) gives again that the conjunction of $\operatorname{Tr}\sigma=0$, $\det\sigma=1$ implies $\sigma^2+1=0$ i.e. $\sigma^2=-1$, and conversely, taking into account that 1 and σ are sections[i2] linear[ly] independent in|of $\mathrm{M}_2(\underline{\mathcal{O}}_S|\mathcal{O}_S)$. Likewise|= (37) shows

$$(38) \qquad (\operatorname{Tr}\rho=1 \text{ and } \det\rho=1)\Longleftrightarrow(\rho^2-\rho+1=0).$$

and we [d2] have the implication

$$(39) \qquad \rho^2-\rho+1=0 \quad\Longrightarrow\quad \rho^3+1=0 \text{ i.e. } \rho^3=-1$$

by virtue of the algebraic identity

$$\rho^3+1=(\rho+1)(\rho^2-\rho+1).$$

So

Corollary 2. The equivalent conditions of (22) are also equivalent to the relation

$$(40) \qquad \rho^2+\rho+1=0.$$

5°) A return to 1°), concerning the situation

$$(41)\qquad \begin{cases} \tilde\rho,\tilde\sigma \text{ with } 1^\circ) \quad \tilde\varepsilon_0 = \tilde\sigma^{-1}\tilde\rho \quad \text{regular unipotent} \quad \text{(i.e.} \\ \tilde\varepsilon_1 = \tilde\rho\tilde\sigma^{-1} = \tilde\rho(\tilde\varepsilon_0) = \tilde\sigma(\tilde\varepsilon_0) \quad \text{regular unipotent) and} \\ 2^\circ) \quad \tilde\varepsilon_0 \text{ and } \tilde\varepsilon_1 \text{ inequivalent in each fiber.} \end{cases}$$

Let $\varepsilon_0, \varepsilon_1$ be the regular unipotent liftings in G — identified with sections of $M|\mathcal{M}$

$$(42)\qquad \varepsilon_0 = 1 + N_0, \quad \varepsilon_1 = 1 + N_1,$$

m1005

Marginal note. m1005 N_0 and N_1 strictly nilpotent i.e. their determinant and their trace d4 zero

with

$$(43)\qquad \tilde\sigma(\varepsilon_0) = \tilde\rho(\varepsilon_0) = \varepsilon_1, \quad \text{i.e.,} \quad \tilde\sigma(N_0) = \tilde\rho(N_0) = N_1.$$

We can then lift $\tilde\sigma$ and $\tilde\rho$ canonically to sections σ, ρ of G (or of $M|\mathcal{M}$) satisfying the following conditions

$$(44)\qquad \begin{cases} 1^\circ) \ -\sigma^{-1}\rho = \varepsilon_0 & [\Longleftrightarrow -\rho\sigma^{-1} = \varepsilon_1] \\ & \left[\begin{array}{l} \Longleftrightarrow \rho + \sigma = -N_1\sigma \ (= -\sigma N_0) \\ \Longleftrightarrow \rho + \sigma = N_1\rho \ (= \rho N_0) \end{array}\right] \\ 2^\circ) \ (\rho+\sigma)^2 = \rho + \sigma & \Longrightarrow (\rho+\sigma)^2 = u(\rho+\sigma) \quad \text{with} \\ & u \in \Gamma G_m \end{cases}$$

Moreover, there exists a d7 unique triple $(\varphi, \rho_0, \sigma_0)$

$$(45)\qquad \begin{cases} G_0 = \mathrm{Gl}(2)_S \xrightarrow{\varphi} G \quad \text{(pinning)} \\ \rho_0, \sigma_0 \in \Gamma(G_0), \quad \rho_0 = \begin{pmatrix} 0 & 1 \\ v|\nu & w|\omega \end{pmatrix}, \quad \sigma_0 = \begin{pmatrix} 0 & -1 \\ v|\nu' & w|\omega' \end{pmatrix} \\ (v|\nu + v|\nu' = 0, w|\omega + w|\omega' = 1), \quad v|\nu \in \Gamma G_m \\ \text{i.e. } v|\nu' = -v|\nu, w|\omega' = 1 - w|\omega \end{cases}$$

such that we have

$$(46|48)\qquad \varphi(\rho_0) = \rho, \quad \varphi(\sigma_0) = \sigma,$$

which implies

$$(47)\qquad \varphi((\varepsilon_0)_0) = \varepsilon_0, \quad \varphi((\varepsilon_1)_0) = \varepsilon_1$$

[scan 337]

[p. 469]

Remark I have the distinct impression that the package of conditions (51) to (56) is redundant, and wonder for example whether the set|one of the three simple algebraic conditions

$$(64) \qquad \sigma^2+1=\rho^2-\rho+1=0, \qquad (\rho+\sigma)^2=\rho+\sigma$$

does not imply the other conditions (defining ε_0 by (51|52))[i1]. The third condition (64) means that

$$(65) \qquad N=\rho+\sigma$$

is idempotent

$$(66) \qquad N^2=N,$$

and in terms of N we will have

$$\sigma^{-1}N=\sigma^{-1}\rho+1 \quad \text{i.e.}$$

$$(67) \qquad \begin{cases} \varepsilon_0 \overset{\text{dfn}}{=} -\sigma^{-1}\rho=1-\sigma^{-1}N=1+N_0 & N_0=-\sigma^{-1}N \\ & \quad =\sigma N \\ \varepsilon_1 \overset{\text{dfn}}{=} -\rho\sigma^{-1}=1-N\sigma^{-1}=1+N_1 & N_1=-N\sigma^{-1}=N\sigma \end{cases}$$

m1009

Marginal note. m1009 N.B. We must d1 specify d2 [illeg. 4] first relations (64) [illeg. 3] $\operatorname{Tr}\sigma=0$, $\det\sigma=1$, $\operatorname{Tr}\rho=0|1$, $\det\rho=1$ must require that [illeg. 2] are regular i.e. not homotheties in any fiber [illeg. 1].

and the condition ε_0 d3 regular unipotent[i2] is expressed by the conditions

$$(68) \qquad \det\sigma N=\operatorname{Tr}\sigma N=0, \qquad \begin{matrix}\sigma N \text{ nonzero in every fiber.} \\ \text{i.e. } N \text{ nonzero in every fiber}\end{matrix}$$

Now the d4 third of these[i3] (68) follows from the others, for if we had $N=0$ on a fiber, we could suppose S the spectrum of a field, $N=0$, i.e. $\rho=-\sigma$, so d5 we would have both

$$\sigma^2+1=0 \qquad \sigma^2+\sigma+1=0 \qquad \text{whence } \sigma=0, \text{ absurd.}$$

I also say that in no fiber do we have $N=1$, otherwise we would have in this fiber d6 $\sigma=1-\rho$ and substituting in $\sigma^2+1=0$ we find d7

$$(1-\rho)^2+1=0 \quad \text{i.e.} \quad \rho^2-2\rho+2=0,$$

[scan 338]

comparing with $\rho^2 - \rho + 1 = 0$, we find [d1] by subtraction $\rho - 1 = 0$ i.e. $\rho = 1$, but the relation $\rho^2 - \rho + 1 = 0$ becomes $1 = 0$, absurd.

Thus the idempotent operator N is [d2] of rank 1 in each fiber[i1], so [illeg. 1] (unless I am mistaken) [d3] that N is [d4] (in terms of $\mathcal{M} \simeq \check{F} \otimes F$) local[ly i2] decomposable in the form $x' \otimes x$, with $\langle x, x' \rangle = 1$, and [d5]

$$\operatorname{Tr} N = 1, \quad \det N = 0$$

so the relation $\det(\sigma N) = 0$ in (68) is also automatic, since $\det \sigma N = \det \sigma \det N = 0$. There remains only the relation

$$\operatorname{Tr} \underbrace{\sigma N}_{\substack{\sigma^2 + \sigma\rho \\ = \sigma\rho - 1}} = 0$$

([d6] which is also written

$$(69) \qquad \operatorname{Tr} \sigma\rho = 2 \quad (\Longleftrightarrow \operatorname{Tr} \sigma^{-1}\rho = -2)$$

for which we would have to see whether or not it follows from the other relations.

Let us take

$$(70) \qquad \begin{cases} \rho = \rho_0 = \begin{pmatrix} 0 & 1 \\ -1 & 1 \end{pmatrix} \\ \sigma = \underline{u}\sigma_0\underline{u}^{-1} = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} d & -b \\ -c & a \end{pmatrix} \\ \quad \text{where } \underline{u} = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \in \Gamma\mathrm{Sl}(2), \text{ i.e. } ad - bc = 1 \end{cases}$$

We find [p. 337]

[scan 339]

[p. 470]

$$(70\text{bis}) \qquad \sigma = \begin{pmatrix} bd+ac & -(a^2+b^2) \\ c^2+d^2 & -(bd+ac) \end{pmatrix}$$

whence

$$N = \rho + \sigma = \begin{pmatrix} (bd+ac) & 1-(a^2+b^2) \\ -1+(c^2+d^2) & 1-(bd+ac) \end{pmatrix}$$

$$N-1 = \begin{pmatrix} (bd+ac)-1 & 1-(a^2+b^2) \\ -1+(c^2+d^2) & -(bd+ac) \end{pmatrix} \quad = -\det(N)N^{-1} \text{ if } \det N \text{ invertible}$$

and we find

$$(71) \qquad N^2 - N = N(N-1) = -\det(N).1$$

so [d1]

$$(72) \qquad N^2 = N \iff \det N = 0\ ; \quad (\Longrightarrow \operatorname{Tr} N = 1)$$

Now we have

$$\begin{aligned} \det N &= bd+ac-(bd+ac)^2 \\ &\quad -|\ = [-1-(a^2+b^2)(c^2+d^2)+a^2+b^2+c^2+d^2] \\ &= bd+ac---2abcd+1++\underline{a^2d^2}+\underline{b^2c^2}+ \\ &\qquad -a^2-b^2-c^2-d^2 \\ &= (bd+ac)-(a^2+b^2+c^2+d^2)+\underbrace{(ad-bc)^2}_{1}+1 \\ &= 2+(bd+ac)-(a^2+b^2+c^2+d^2) \end{aligned}$$

so the condition (72)|(71) is equivalent to

$$(73) \qquad a^2+b^2+c^2+d^2 = 2+(bd+ac),$$

on the other hand we have by 70, (70bis)

$$\rho\sigma = \begin{pmatrix} c^2+d^2 & -(bd+ac) \\ c^2+d^2-(bd+ac) & a^2+b^2-(bd+ac) \end{pmatrix}$$

so

$$(74) \qquad \operatorname{Tr}\sigma\rho = \operatorname{Tr}\rho\sigma = a^2+b^2+c^2+d^2-(bd+ac) = 2$$

Scans 340–358

[scan 340]

This calculation strongly suggests that the relations d1 (64) already imply (68)… it is even very nearly a proof… If we admit this point, it only remains to verify that the preceding conditions (64)i1 (i.e. essentially already (51) to (56) except (55)) also imply (55), i.e. the independence of the $\varepsilon_0, \varepsilon_1$ in every fiber, i.e. that N_0, N_1 are non-homothetic in every fiber. Now (67)

$$(*) \qquad N_1 = \tilde{\sigma}(N_0), \ \dagger = \tilde{\rho}(N_1|N_0) \ :$$

If we had on a fiber

$$(\dagger) \qquad N_1 = \lambda N_0$$

we would conclude from this, by applying d5 using $\tilde{\sigma}^2 = 1$, and $\tilde{\rho}^3 = 1$,i3 the relationsi4 d6

d10

$$\lambda^2 = 1, \quad \lambda^3 = 1 \qquad \text{whence } \lambda = 1$$

i.e. $N_0 = N_1$ i.e. N_0 commutes with σ, ρ thus also $N = -\sigma N_0 = \rho^{-1} N_0$i5 commutes with σ, ρ, and since $N = \sigma + \rho$, σ and ρ commute. But then [p. 339]

[scan 342]

requiring in addition, if need be, that σ, ρ also be regular i.e. be scalars on no fiber. One would have to convince oneself that this implies that

$$N \overset{\text{dfn}}{=} \rho + \sigma$$

does satisfy the idempotence relation

$$(75) \qquad N^2 - N = 0$$

(which is equivalent, if N regular, to

$$(77) \qquad \operatorname{Tr} N = 1, \quad \det N = 0 \qquad (?)$$

But N is regular, for if on a fiber it were a scalar we would have that (restricting to this fiber) ρ and σ commute, we would have

$$-\sigma^{-1}\rho = \sigma\rho = \varepsilon_0 = 1 + N_0$$
$$-''\rho\sigma^{-1} = \rho\sigma = \varepsilon_1 = 1 + N_1,$$

d1

d2

$$(1-\sigma\rho)^2 = 0 \quad \text{i.e.} \quad 1 - 2\sigma\rho + \underbrace{\sigma^2}_{-1}\underbrace{\rho^2}_{\rho-1} = 0 \quad \text{i.e.}$$
$$1 - 2\sigma\rho + 1 - \rho = 0 \quad \text{i.e.} \quad 2 = \rho + 2\sigma\rho$$

that is, multiplying by σ

$$2\sigma = \rho\sigma + 2\underbrace{\sigma^2}_{-1}\rho \quad \text{i.e.} \quad 2\underbrace{(\sigma+\rho)}_{N} = \rho\sigma$$

But by hypothesis we have $N = \lambda.1$, λ a scalar, whence $\rho\sigma = 2\lambda$, and taking the determinants

$$\det\underbrace{(\rho\sigma)}_{1} = 4\lambda^2$$

i.e. 2 invertible and $\lambda = \dfrac{\varepsilon}{2}$, with $\varepsilon^2 = 1$,

$$\text{i.e.} \qquad \rho\sigma = \varepsilon \qquad \varepsilon^2 = 1,$$
$$\rho^2\underbrace{\sigma^2}_{-1} = 1 \qquad \underbrace{\rho^2}_{\rho-1} = -1, \quad \text{i.e.} \quad \rho = 0, \quad \underline{\text{absurd}}$$

is

$$(3) \qquad \rho_{e_0,e_1} = \begin{pmatrix} 0 & -v|\nu \\ 1 & w \end{pmatrix}$$

m1014

Marginal note. m1014 (i.e. $\rho e_0 = e_1$ whence d1 $\rho e_1 = -v\rho e_0 - we_0$

c") (Case $\mathcal{M} = \underline{\mathrm{End}}_{\underline{\mathcal{O}}_S}(F)$)i1 $\exists$ locally Zariski a basis (e_0, e_1) of F such that the matrix of ρ with respect to it is

$$(4) \qquad \rho_{e_0,e_1} = \begin{pmatrix} 0 & 1 \\ -v & w \end{pmatrix}$$

d) The commutant of ρ in $\mathcal{M}$ is reduced to $\mathcal{A}_\rho = \underline{\mathcal{O}}_S + \underline{\mathcal{O}}_S\rho$, and it remains so after every base change $S' \to S$.

d') Item|Item in each fiber.

Proof $a \iff a'$ trivial (linear algebra of the Modules $\mathcal{M}$ and of the submodules $\underline{\mathcal{O}}_S 1$ locally direct summands)

$b \iff b' \iff b''$ trivial, $b) \Longrightarrow a)$ as well.

$a \Longrightarrow b$ it suffices to choose e_0 d2on i2 a d3fiber i3 so as not to be an eigenvector under ρ (possible over a field, for a nonscalar operator) then to lift in a neighborhood.

$b \iff$ i4 $c) \iff c')$ trivial ; d4the bases for which i5 ρ_{e_0,e_1} is of the form $\begin{pmatrix} 0 & -v \\ 1 & w \end{pmatrix}$ are precisely the bases of the form $(e_0, e_1 = \rho e_0)$.

$c') \iff c'')$ means that if ρ satisfies the conditions under consideration, ${}^t\rho$ does too. (d5 and conversely it follows from this that the condition for ${}^t\rho$ implies it for $\rho = {}^t({}^t\rho)$d6, i.e. $c'') \longrightarrow c')$) — but this is immediate in the form a).

Thus the conditions a) to c") are equivalent, moreover $d) \Longrightarrow d') \Longrightarrow a)$ is trivial, it remains to prove that b (for example) $\Rightarrow d)$. d7Since b stable i6 under base change, it suffices to see that

[p. 474]
d1

N.B. In fact, $G = \underline{\mathcal{M}}^*$ operates on $\underline{\mathcal{M}}$ (by inner automorphisms) or on G, or SG, via $PG = \underline{\mathcal{M}}^*/\mathbb{G}_m$, and PG is an fppf quotient of SG (and even|= for the topology (étale), if 2 invertible).

So we see that in[i1] the preceding conjugation criterion, in the formula

$$(6) \qquad \rho' = \mathrm{int}(\alpha)\rho = \alpha\rho\alpha^{-1},$$

we may assume $\alpha \in \Gamma \mathrm{S}\ell(2)|SG$.

[d2]Corollary 2 Let[i2] $\rho, \zeta|\xi$ be two sections of G, ρ being regular. For us to be able to find locally Zariski an $\alpha \in \Gamma G$ such that

$$(7) \qquad [\alpha, \rho] = \zeta \qquad \text{i.e.} \quad \alpha\rho\alpha^{-1} = \zeta\rho$$

it is necessary and sufficient that we have

a) $\zeta\rho$ is regular, i.e. ζ [d3] non-homothetic to ρ^{-1} on any fiber

b) $\det\zeta = 1$, $\mathrm{Tr}\,\zeta\rho = \mathrm{Tr}\,\rho$

(We can then take α in SG…)

This is|These are only the conditions of corollary 1 [d4] for conjugation of $\zeta\rho$ to ρ, the condition $\det\zeta\rho = \det\rho$ also being written as $\det\zeta\det\rho = \det\rho$ i.e. $\det\zeta = 1$.

Corollary 3 The indeterminacy of α in the solution of (7) is of the form $\alpha \mapsto \alpha\underline{t}$, with $\underline{t}$ a section of $\underline{\mathcal{A}}^*_\rho$, i.e. $t = c\rho + d$, with $c, d \in \Gamma\underline{\mathcal{O}}_S$, $\det(c\rho + d)$ invertible. i.e. ⑧ $c^2v|\nu + wcd + d^2$ invertible[i3] (where, $v = \det\rho$, $w = \mathrm{Tr}\,\rho$, cf. (1)).

if u is a section of $\mathcal{M}$ [d1] which commutes with ρ, then $u = a + b\rho$ $(a, b \in \Gamma\underline{\mathcal{O}}_S)$. By a) a and b are unique, and this shows that the question is fppf local. We may assume therefore $\mathcal{M} = \underline{\mathrm{End}}(F)$, F equipped with a basis $(e_0, e_1 = \rho(e_0))$. [d2] We will have, if

$$u(e_0) = ae_0 + be_1 = u'(e_0) \qquad \text{where} \quad u' = a + b\rho,$$

and if u commutes [d6] with ρ, we will have

$$u(e_1) = u\rho(e_0) = \rho u(e_0)$$

likewise

$$u'(e_1) = u'\rho(e_0) = \rho u'(e_0) \qquad \text{for } u' \text{ commutes with } \rho$$

therefore

$$u(e_0) = | \neq u(e_0')|u'(e_0), \quad u(e_1) = u'(e_1) \qquad \text{therefore } u = u',$$

q.e.d.

Definition : A section of $\mathcal{M}$[i3] which satisfies the equivalent conditions of the proposition is called regular. Item|Item for sections of G, SG, interpreted as sections of $\mathcal{M}$ — [d8] such a section is regular iff at no point is it a scalar, i.e. is not in the center. This remains|is stable under multiplication by an invertible scalar — whence by passage to the quotient we deduce the notion of a regular section of PG — these are the sections which are not $= 1$ on any fiber.

Corollary 1 Let ρ, ρ' be two [d9] sections of $\mathcal{M}$, ρ being regular.[i4] For them to be conjugate (locally Zariski) via $\mathcal{M}^*$, it is necessary and sufficient that [d10] a) ρ' be regular (Condition of regularity[i5] [d11]) and b) we have

$$(5) \qquad \det \rho = \det \rho', \quad \mathrm{Tr}\, \rho = \mathrm{Tr}\, \rho'$$

[scan 349]

Proposition. Let P be a section of $\mathcal{M}$. Equivalent conditions

a) P is regular, and $P^2 = P$

b) $\det P = 0, \quad \operatorname{Tr} P = 1$

c) (If $\mathcal{M} = \underline{\operatorname{End}}_{\underline{\mathcal{O}}_S}(F)$) $\exists$ basis e_0, e_1 of F such that the matrix of P is

$$P_{e_0,e_1} = \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix} \qquad \text{i.e.}$$

P is the projection of $\underline{\mathcal{O}}_S e_0 \oplus \underline{\mathcal{O}}_S e_1$ onto the factor $\underline{\mathcal{O}}_S e_1$

d) $\exists$ (Zariski locally)[i1] isomorphism $\mathcal{M} \underset{\sim}{\overset{\varphi|\psi}{\leftarrow}} \mathrm{M}_2(\underline{\mathcal{O}}_S)$, taking $\begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix}$ to P.

c') (If $\mathcal{M} = \underline{\operatorname{End}}_{\underline{\mathcal{O}}_S}(F)$) P is a projector whose image D_1[i2] and kernel D_0[i3] are of rank 1.

Remark [d1] For the proof, we will note that the numerical condition b) already implies that P is regular, for if P were a scalar λ (on a fiber) we would have

$$\det P = \lambda^2 = 0, \quad \operatorname{Tr} P = 2\lambda = 1$$

hence λ would be invertible and would have square zero, absurd. Note that this argument shows, more generally, that if ρ is a section of $\mathcal{M}$ such that

$$(12) \qquad \delta(\rho) = (\operatorname{Tr}\rho)^2 - 4\det\rho = w^2 - 4v|\nu$$

m1016

Marginal note. [m1016] (= discriminant of the Hamilton-Cayley polynomial of ρ)

is an invertible section of $\underline{\mathcal{O}}_S$, then ρ is a regular section of $\mathcal{M}$.

[d2] The P [d3] satisfying the conditions of the preceding proposition are called the elementary projectors in $\mathcal{M}$. Proof|their.

Corollary We have a one-to-one correspondence between the elementary projectors in $\mathcal{M}$, and the Killing pairs (B, T) in G (or SB, ST in SG, or PB, PT in PG), by

[scan 350]

[p. 476]

associating to d1 P the d2 torus $T = \underline{A}^*_P$, and the Borel B_0 i1 d3 d4 formed of the α which stabilize d5 D_0 d6 d7 d8 hence with respect|p.v. i4 d9 d10 to e_0, e_1 we will have

$$(13)\qquad \begin{cases} T = \left\{ \begin{pmatrix} \mu_0 & 0 \\ 0 & \mu_1 \end{pmatrix} \;\middle|\; \mu_0, \mu_1 \in \Gamma G_m \right\}, \\ B_0 = \left\{ \begin{pmatrix} \mu_0 & \lambda \\ 0 & \mu_1 \end{pmatrix} \;\middle|\; \mu_0, \mu_1 \in \Gamma G_m,\ \lambda \in \Gamma G_a \right\}. \end{cases}$$

The Killing pair opposite to (T, B_0) is (T, B_1), with

$$(14)\qquad B_1 = \left\{ \begin{pmatrix} \mu_0 & 0 \\ \lambda & \mu_1 \end{pmatrix} \;\middle|\; \mu_0, \mu_1 \in \Gamma G_m,\ \lambda \in \Gamma G_a \right\},$$

in a slightly more intrinsic way, B_1 d11 is the stabilizer of D_1. The elementary projector associated to the Killing pair opposite (T, B_1) i5 is $1 - N$.

Remark. The scheme of the ε_1 regular unipotents, or again of the regular nilpotent N i6 is a bundle of punctured lines (i.e. a G_m-torsor) over the scheme $\mathcal{P}$ i7 of Borels (of G, of SG or of PG, it amounts to the same|=), it is d12 smooth of relative dimension 2 — the scheme of elementary projectors N is d13 isomorphic to that of Killing pairs, smooth-fibered of relative dimension 1 over the scheme of Borels. The d14 fiber product of these two relative i8 schemes over $\mathcal{P}$ = scheme of Borels, is isomorphic to the scheme of pinnings of G (or of SG, or of PG) i.e. of isomorphisms $\mathrm{G}\ell(2)_S \xrightarrow{\sim} G$ (resp. $\mathrm{S}\ell(2)_S \xrightarrow{\sim} SG$,

[scan 351]

resp. $\mathrm{GP}(1)_S \xrightarrow{\sim} PG$), which is a torsor under $\mathrm{GP}(1)_S \simeq \underline{\mathrm{Aut}}_{S-\mathrm{gr}} \mathrm{G}\ell(2)_S \simeq \underline{\mathrm{Aut}}_{S-\mathrm{gr}} \mathrm{S}\ell(2)_S \simeq \underline{\mathrm{Aut}}_{S-\mathrm{gr}}(\mathrm{GP}(1)_S)$. We say that ε and [d1] P are associated, (or $N = \varepsilon - 1$ and P are associated),[i1] if they define the same|= Borel, i.e. [d2] [d3]come[i2] from a pinning. We check that this amounts to the following relations

$$PN = 0, \qquad NP = N \tag{15}$$

[d4] or again, in terms of P and $\varepsilon = 1 + N$

$$(16) \qquad P\varepsilon = P, \qquad \varepsilon P = P + \underbrace{\varepsilon - 1}_{N}$$

This is really pretty!

We now consider the question of [d5]the[i3] conjugation of the sections $\tilde{\rho}, \tilde{\rho}'$ of PG, defined by sections ρ, ρ' of G. We assume $\tilde{\rho}$ regular i.e. $\neq 1$ in each [d6] fiber, i.e. ρ regular — [d7] [d8] the conjugation of $\tilde{\rho}, \tilde{\rho}'$[i4] by a section u of G (say) means that we have

$$(17) \qquad \rho' = \lambda u \rho u^{-1}, \qquad \lambda \in \Gamma G_m$$

whence we deduce

$$\det \rho' = \lambda^2 \det \rho \qquad \operatorname{Tr} \rho' = \lambda \operatorname{Tr} \rho$$

and hence

$$(18) \qquad \frac{\operatorname{Tr}^2 \rho'}{\det \rho'} = \frac{\operatorname{Tr}^2 \rho}{\det \rho}.$$

Let us put, for a section of G

$$(19) \qquad \Delta(\rho) = \frac{\operatorname{Tr}^2 \rho}{\det \rho},$$

[scan 352]

[p. 477]

we have done what was needed for us to find a $G \longrightarrow \mathbb{E}^1$ which passes to the quotient as

$$(20) \qquad \begin{array}{c} PG \xrightarrow{\Delta} \mathbb{E}^1 \\ \Delta(\tilde\rho) = \Delta(\rho) = \dfrac{(\operatorname{Tr}\rho)^2}{\det\rho}, \end{array}$$

and which is|remains invariant under inner automorphisms.

Proposition. In order for two sections $\tilde\rho, \tilde\rho'$ of PG to be [d1] conjugate fppf locally, $\tilde\rho$ being regular,[i1] it is necessary [d2] that $\tilde\rho'$ be regular, and that we have

$$(21) \qquad \Delta(\tilde\rho') = \Delta(\tilde\rho)$$

i.e. (in terms of ρ, ρ' lifting $\tilde\rho, \tilde\rho'$) that ρ' be regular and satisfy (18). These conditions are sufficient when $\Delta(\tilde\rho)$ invertible i.e. $\operatorname{Tr}\rho$ invertible. It remains to prove sufficiency. Let us note that fppf locally, exists $\lambda \in \Gamma G_m$ [i2] such that

$$\det(\rho') = \det(\lambda\rho) \qquad \text{i.e.} \quad \lambda^2 = \frac{\det\rho'}{\det\rho}.$$

Thus we may assume (at the cost of replacing ρ by $\lambda\rho$) that $\det\rho = \det\rho'$. Then (18) amounts to

$$(22) \qquad \operatorname{Tr}^2\rho' = \operatorname{Tr}^2\rho.$$

[d3] the question amounts to seeing that $\exists\varepsilon \in \Gamma\mu_2$, such that

$$\operatorname{Tr}\rho' = \varepsilon \operatorname{Tr}\rho \quad (= \operatorname{Tr}\varepsilon\rho),$$

we will also have

$$\det\rho' = \det\varepsilon\rho \quad (= \underbrace{\varepsilon^2}_{1} \det\rho = \det\rho),$$

whence local conjugation of ρ' and $\varepsilon\rho$, we will be done. But if τ', τ are two sections of $\mathcal{O}_S$, with τ invertible, such that $\tau'^2 = \tau^2$, we will indeed have $\tau' = \varepsilon\tau$ ($\varepsilon = \tau'/\tau$), and $\varepsilon^2 = 1$, OK.

[scan 355]

We would like to give intrinsic "numerical criteria" for ρ, σ to have the preceding properties…

Proposition Let ρ, σ be two d1i1 sections of G,

d2 Put i2

$$\varepsilon \qquad \varepsilon_0 = -\sigma^{-1}\rho, \qquad \varepsilon_1 = -\rho\sigma^{-1}$$

so that we thus have

$$\varepsilon_1 = \sigma(\varepsilon_0) = \rho(\varepsilon_0).$$

Equivalent conditions

a) 1°) i3 ε_0 d3 d4 is i4 regular|regular unipotent|unipotent d5 ($\Leftrightarrow \varepsilon_1$ i5 regular unipotent) and 2°) i6 ε_0 and ε_1 d6 d7 independent in each fiber i7, — i.e. putting

$$\varepsilon_0 = 1 + N_0, \qquad \varepsilon_1 = 1 + N_1$$

N_0 ($\Leftrightarrow N_1$) is regular nilpotent, and N_0 and N_1 are everywhere nonhomothetic.

b) We have

$$(32) \quad \left\{ \begin{array}{ll} a) & \det\sigma = \det\rho \\ b) & \operatorname{Tr}\sigma^{-1}\rho = -2 \\ c) & u \overset{\text{dfn}}{=} \operatorname{Tr}(\sigma+\rho) \text{ is invertible} \end{array} \right\}$$

d9 d10 m1024

Marginal note. m1024 these two relations express $\det(\varepsilon_0) = 1$, $\operatorname{Tr}\varepsilon_0 = 2$ i.e. ε_0 is d11 unipotent

m1025

Marginal note. m1025 this expresses that ε_0 is regular and independent of ε_1, cf. loc. cit.

cf. proposition page 449′

c) We have d12

$$(33)\qquad \begin{cases} a) & \det\sigma = \det\rho \\ b) & \det(\sigma+\rho) = 0 \\ c) & \mathrm{Tr}(\sigma+\rho) \text{ invertible} \end{cases}$$

d) We have $\det\sigma = \det\rho$, and there exist an elementary projector P and an invertible scalar $u \in \Gamma\mathbb{G}_{\mathrm{m}}$, such that we have

$$(34)\qquad \sigma+\rho = uP$$

m1027

Marginal note. m1027 N.B. P and u are uniquely determined, $u = \mathrm{Tr}(\sigma+\rho)$, $P = \frac{1}{u}(\sigma+\rho)$

[p. 479]
d1

e) $\exists$ isomorphism $\mathrm{G}\ell(2) \xrightarrow{\varphi}_{\sim} G$, d2i1 such that we have

$$(35)\quad \begin{cases} \varphi^{-1}(\varepsilon_1) = \begin{pmatrix} 1 & 0 \\ 1 & 1 \end{pmatrix} \\ \varphi^{-1}(\varepsilon_0) = \begin{pmatrix} 1 & ? \\ 0 & 1 \end{pmatrix} \end{cases}$$

f) $\exists$ isomorphism $\mathrm{G}\ell(2) \simeq G$ such that we have

N.B. this isomorphism is unique

$$(36)\quad \begin{cases} \varphi^{-1}(\rho) = \begin{pmatrix} 0 & u \\ v & w \end{pmatrix} \qquad \varphi^{-1}(\sigma) = \begin{pmatrix} 0 & w'|u' \\ v' & w' \end{pmatrix} \\ \text{with} \qquad u + u' = v + v' = 0, \qquad w + w' = u \end{cases}$$

m1029

Marginal note. m1029 N.B. We will have $P = \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix}$

m1030

Marginal note. m1030 this φ is again unique; We will have

$$(37)\quad \begin{cases} u = \mathrm{Tr}(\sigma + \rho)\ (= -u') \\ w = \mathrm{Tr}\,\rho \quad (w' = \mathrm{Tr}\,\sigma) \\ -uv = \det\rho = \det\sigma \end{cases}$$

which describes u, w, v in terms of ρ, hence also u', v', w' ...

d4

We will have in (35), with

$$\varphi^{-1}(\varepsilon_0) = \begin{pmatrix} 1 & u/v \\ 0 & 1 \end{pmatrix}, \tag{38}$$

and we will have

$$\sigma + \rho = uP, \quad \text{with } \varphi^{-1}(P) = \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix}. \tag{39}$$

Easy proof. The equivalence $a) \Leftrightarrow b)$ seen|seen in proposition page 449′. For $b) \Leftrightarrow c)$, we write

$$\det(\sigma+\rho) = \det\{\sigma(1+\sigma^{-1}\rho)\} = \det\sigma \underbrace{\det(1+\sigma^{-1}\rho)}_{1+\operatorname{Tr}\sigma^{-1}\rho+\underbrace{\det\sigma^{-1}\rho}_{(\det\sigma)^{-1}\det\rho}}$$

$$=$$

$$= \det\sigma + \det\rho + (\det\sigma)\operatorname{Tr}(\sigma^{-1}\rho)$$

so by virtue of the hypothesis

$$\det\sigma = \det\rho$$

common to $b)$ and $c)$, we will have

$$\det(\sigma+\rho) = \det\sigma\,(2+\operatorname{Tr}(\sigma^{-1}\rho)) \tag{∗|6}$$

so the first side|side is zero iff $\operatorname{Tr}\sigma^{-1}\rho = -2$, which was to be proved.

[p. 355]

[scan 357]

Putting $Q = \sigma + \rho$, the equivalence $b \Leftrightarrow c$ comes from the equivalence (valid for every section Q of M)

$$(\det Q = 0, \operatorname{Tr} Q \text{ invertible}) \Longleftrightarrow \begin{pmatrix} \exists \text{ elementary projector } P, \text{ and } u \in \Gamma\mathbb{G}_{\mathrm{m}}, \\ \text{such that } Q = uP \end{pmatrix} \tag{40}$$

which follows easily from the results of the preceding n° (it is a corollary of the proposition page 475′, which I forgot to make explicit.

The equivalence with $e)$, $f)$ is also immediate, [d1] and merely summarizes certain preceding calculations.

Marginal note. m1031 Corollary Under these conditions $1, N_0, N_1, P$ form a basis of M, and ρ and σ are independent linear combinations of d2 N_0, N_1, P

$$\begin{cases} \rho = v(N_0 + N_1) + wP \\ \sigma = -v(N_0 + N_1) + (u - w)P \end{cases}$$

ρ, σ form an obviously|obvious basis of the sub-Module|submodule of M generated by $(N_0 + N_1)$ and P, hence

$$\rho, \sigma, N_0, 1 \qquad \text{and} \qquad \rho, \sigma, N_1, 1$$

also form bases of M, and in them we can replace either ρ, or σ by P; i.e. in $N_0, N_1, P, 1$ we can replace N_0, or N_1 by ρ or σ.

Our point of view here is that we start from $\tilde{\rho}, \tilde{\sigma}_1$, which we want to describe — the pinning is indeed already defined in terms of $\tilde{\rho}, \tilde{\sigma}$, but there remains the question of normalizing the liftings of $\tilde{\rho}, \tilde{\sigma}$ to ρ, σ. We have already made a first restriction by the formulas

$$\varepsilon_1 = -\sigma^{-1}\rho$$

by eliminating the scalar factor[i1] λ_0 — we can normalize|simplify further by multiplying ρ, σ by the factor u^{-1}, so as to obtain the simple expression.

$$(40) \qquad \operatorname{Tr}(\rho + \sigma) = 1 \quad \text{i.e.} \quad \operatorname{Tr}\rho + \operatorname{Tr}\sigma = 1 \quad \text{i.e.} \quad u = 1,$$

which thus means that ρ, σ are of the

form

$$(41) \qquad \rho = \begin{pmatrix} 0 & 1 \\ v & w \end{pmatrix}, \qquad \sigma = \begin{pmatrix} 0 & -1 \\ v' & w' \end{pmatrix}$$

$$v + v' = 0, \quad w + w' = 1 \qquad \text{i.e.} \quad v' = -v, \quad w' = 1 - w,$$

so

$$(42) \qquad \varepsilon_0 = \begin{pmatrix} 1 & 1/v \\ 0 & 1 \end{pmatrix},$$

where we have identified, by φ, $\mathrm{G}\ell(2)_S$ and G.

d1 Is. there uniqueness of ρ, σ in terms of $\tilde{\rho}, \tilde{\sigma}$,i1 d2 by the conditions $\varepsilon_1 = -\rho\sigma^{-1}$ (i.e. $\varepsilon_0 = -\sigma\rho^{-1}$) and (40)? I would first like to check carefully an assertion made in passing a certain number of times, namely that the d3 morphismi2

$$G \longrightarrow PG \simeq G/\mathbb{G}_{\mathrm{m}}$$

induces a bijection

(43)

$$\begin{array}{c}\text{unipotents}\\ \text{regular of}\\ G\end{array} \longrightarrow \begin{array}{c}\text{unipotents}\\ \text{regular}\\ \text{of } PG\end{array}$$

,

(at least locally d5 fppfi3 d6)

the surjectivity of this map could here serve as a definition for the regular unipotents of PG. So it is a matter of testing injectivity, which also means d7 this: if $\varepsilon, \varepsilon'$ are two regular unipotent sections of M, such that $\tilde{\varepsilon} = \tilde{\varepsilon}'$ i.e.i4 $\varepsilon' = \lambda\varepsilon$ ($\lambda \in \Gamma\mathbb{G}_{\mathrm{m}}$), then $\varepsilon = \varepsilon'$, i.e. $\lambda = 1$.i5 Taking the determinants of the two sides, we will have

$$\lambda^2 = 1, \tag{44}$$

m1032

Marginal note. m1032 So, we will say that a section of PG is regular unipotent if it is locally fppf the image of a regular unipotent section of G.

taking traces we find

$$2\lambda = 2 \tag{45}$$

— these are the necessary and sufficient conditions on λ for [d1] (ε being regular unipotent) $\lambda\varepsilon$ to be still strict[ly][i1] unipoten[t] (hence necessari[ly] regular unipotent). If 2 is invertible on S, more generally if 2 is a regular section of $\mathcal{O}_S$,[i2] [d2] these conditions imply $\lambda = 1$, OK, but [d3]outside[i3] of this hypothesis (for example in characteristic 2 [d4] over a nonreduced scheme) this is no longer necessarily so. Let us write

$$\lambda = 1 + \nu$$

the conditions (44) (45) read

$$2\nu = 0, \quad \nu^2 = 0, \tag{46}$$

thus for the map (43) to be an injection on S, it is necessary and sufficient that the only[i4] sections of S which satisfy (46) are the zero section.

In general, denoting by μ_2' the subgroup scheme of μ_2 defined by (45) (it is in fact an absolute infinitesimal group scheme[i5], [d5] finite over $\mathbb{Z}$, not flat over $\mathbb{Z}$,[i6] isomorphic to the spectrum of

$$\mathbb{Z}[T]/(T^2 - 1, 2T - 2) \simeq \mathbb{Z}[S]/(S^2, 2S),$$

also isomorphic to the scheme of dual numbers over $\mathbb{Z}$, relative to the module $\mathbb{Z}/2\mathbb{Z}$ over $\mathbb{Z}$, [d6]

$$\mu_2' \simeq \mathrm{Spec}(\mathbb{Z} \oplus \underbrace{\mathbb{Z}/2\mathbb{Z}}_{\text{square-zero ideal}}) \quad \ldots$$

[scan 360]

[p. 481] It turns out that μ'_{2S} operates freely by translations[i1] on the scheme of regular unipotents (or not)[i2] of G, and we have

$$\underline{\text{Unip.rég}}(G)/\mu'_{2S} \xrightarrow{\sim} \underline{\text{Unip.rég}}(PG) \quad . \tag{47}$$

This seems at first sight to be in contradiction with the sequence of Borels

$$\begin{array}{ccccc} B & & \underline{\text{Borels}}(G) & \xrightarrow[B\mapsto B/G_m]{\sim} & \text{Borels}(PG) & & \widetilde{B} \\ \Big\downarrow & & \Big\downarrow \wr & & \Big\downarrow \wr & & \Big\downarrow \\ B_u & & \text{“Subgroups unipotent with 1 parameter” of } G & \xrightarrow{\sim} & \text{“Subgroups unipotent with 1 parameter” of } PG & & \widetilde{B}_u \end{array} \tag{48}$$

$$\text{that is} \quad L \longmapsto p(L)$$

(where $p : G \to PG$ is the canonic[al] morphism)

Could the difficulty come from the fact that the vertical arrows (surjective, by definition of the notion of "1-parameter unipotent subgroups" of G or of PG) might not be injective, outside the hypothesis that 2 is invertible (i.e. residue characteristic $\neq 2$)? I feel like saying that

$$\underline{B} = \mathrm{Norm}(B_u), \quad \widetilde{B} = \mathrm{Norm}(\widetilde{B}_u) \tag{49}$$

are formulas which allow us to recover $B, \widetilde{B}$ with the help of $B_u, \widetilde{B}_u$,|" — and I have [d4] indeed already checked the first of these formulas, by dint of linear algebra in M (in the form: the 1-parameter unipotent subgroups of G correspond 1-1 to the sections of $\mathbb{P}$ over S, i.e. to the line subbundles D of F…) — [p. 359]

[scan 361]

but this same point in PG, it is [d1] not very trivial.[i1] [d2]

The difficulty must rather come from the fact that a|that no regular unipotent section $\tilde{\varepsilon}$ of PG does not define (without restriction on S) a 1-parameter unipotent subgroup — whereas for a section ε of regular unipotents|regular unipotent of G

$$\varepsilon = 1 + N,$$

we define one[i2] by the formula

$$\varepsilon(t) = 1 + tN\,.$$

We will note that if we replace ε by $\varepsilon' = \lambda\varepsilon$ (with λ satisfying (44) (45) $\lambda^2 = 1$, $2\lambda = 2$), We have

$$\varepsilon' = (1+\nu)(1+N) = 1 + N' \qquad N' = (1+\nu)N + \nu$$

and

$$\varepsilon'(t) = 1 + tN'$$

I say that if $\lambda \neq 1$ i.e.[i4] $\nu \neq 0$, [d3] the composite homomorphisms

$$\underline{\tilde{\varepsilon}}, \underline{\tilde{\varepsilon}}' : \mathbb{G}_{a|0} \longrightarrow G \longrightarrow PG$$

[d4] associated to $\varepsilon, \varepsilon'$ will be distinct, although they have the same value for $t = 1$. Indeed, [d5] ‖ the derivatives at the origin of $\underline{\tilde{\varepsilon}}, \underline{\tilde{\varepsilon}}'$ are identified with the composites

$$\underline{\mathcal{O}}_S \longrightarrow M \longrightarrow M/\underline{\mathcal{O}}_S = \mid \simeq P\mathfrak{g}$$

[scan 362]

[p. 482] which send 1 to $\widetilde{N}$ resp. to $\widetilde{N}'$, (where the $\sim$ here denotes passage to the additive quotient) we have

$$\widetilde{N}' = (1+\nu)\widetilde{N}$$

and $\widetilde{N}$ is a section of $P\mathfrak{g}$ everywhere nonzero — thus we can have [d1]

$$\widetilde{N}' = \widetilde{N} \quad \text{i.e.} \quad (1+\nu)\widetilde{N} = \widetilde{N} \quad \text{i.e.} \quad \nu\widetilde{N} = 0$$

only if $\nu = 0$, i.e. $\lambda = 1 + \nu = 1$, q.e.d.

In conclusion, we must consider that we give ourselves in PG, not only $\tilde{\rho}$ and $\tilde{\sigma}$ (whence $\tilde{\varepsilon}_0 = \tilde{\sigma}^{-1}\tilde{\rho}$, $\tilde{\varepsilon}_1 = \tilde{\rho}\tilde{\sigma}^{-1}$), but also "1-parameter subgroups" (parametrized)

$$\longrightarrow \quad ,$$

$$\begin{cases} \underset{\sim}{\tilde{\varepsilon}}_0 : \mathbb{G}_{a|0} \longrightarrow PG \\ \\ \underset{\sim}{\tilde{\varepsilon}}_1 : \mathbb{G}_{a|0} \longrightarrow PG \end{cases} . \tag{49}$$

related of course by

$$\begin{cases} \underset{\sim}{\tilde{\varepsilon}}_1 = \rho(\underset{\sim}{\tilde{\varepsilon}}_0)(= \sigma(\underset{\sim}{\tilde{\varepsilon}}_0)) \quad \text{i.e.} \\ \underset{\sim}{\tilde{\varepsilon}}_1(t) = \rho(\underset{\sim}{\tilde{\varepsilon}}_0(t)) = \sigma(\underset{\sim}{\tilde{\varepsilon}}_0(t|u)) \end{cases} \tag{50}$$

which means precisely that we give ourselves, in addition to $\tilde{\rho}, \tilde{\sigma}$, a lifting[d5] regular[i2] unipoten[ti1] ε_0 of $\tilde{\varepsilon}_0$ ([d6] the choice is therefore not a priori unique), and we deduce ε_1 from it by

$$\varepsilon_1 = \tilde{\rho}(\varepsilon_0) = \tilde{\sigma}(\varepsilon_0)$$

m1034

Marginal note. [m1034] we will necessarily have a relation $\sigma^{-1}\rho = -\lambda_0\varepsilon_0$ hence [d8] $\sigma(\varepsilon_0)|\sigma^{-1}(\varepsilon_0) = \rho(\varepsilon_0) =$

[scan 363]

[p. 4] [d1] Thus, we have adjusted the [d2] description[i1] of the data, so as to [d3] be able to give precise normalization statements — namely

Proposition Let $\tilde{\rho}, \tilde{\sigma}$ be sections of PG, and $\underline{\tilde{\varepsilon}}_0$ a "strict" additive[i2] subgroup with 1 parameter

m1035

Marginal note. [m1035] (i.e. a monomorphism and whose image is a $\widetilde{B}_u$)

$$\underline{\tilde{\varepsilon}}_0 : \mathbb{G}_{a|0} \longrightarrow |\!-\!- PG \quad .$$

such|such that we have ×|∗

$$\tilde{\sigma}^{-1}\tilde{\rho} = \underline{\tilde{\varepsilon}}_0(1) \overset{\text{dfn}}{=} \tilde{\varepsilon}_0 \tag{51}$$

whence

$$\begin{cases} \tilde{\sigma}(\underline{\tilde{\varepsilon}}_0) = \tilde{\rho}(\underline{\tilde{\varepsilon}}_0) \overset{\text{dfn}}{=} \underline{\tilde{\varepsilon}}_1, \quad \text{and} \\ \tilde{\rho}\tilde{\sigma}^{-1} = \underline{\tilde{\varepsilon}}_1(1) \overset{\text{dfn}}{=} \tilde{\varepsilon}_1 = \rho(\tilde{\varepsilon}_0) = \sigma(\tilde{\varepsilon}_0) \end{cases} \tag{52}$$

Then:

1) ("For the record") ∃ unique $\varepsilon_0, \varepsilon_1$ [d4] regular unipotent[i3] sections [d5] of G such that (setting $\varepsilon_i = 1 + N_i$, $\underline{\varepsilon}_i(t) = 1 + tN_i$) we have

$$\underline{\tilde{\varepsilon}}_i(t) = \varepsilon_i(t)^{\sim} \ . \tag{53}$$

2) [d7] We will then have[i4]

$$\dot{\varepsilon}_1|\varepsilon_1 = \tilde{\sigma}(\varepsilon_0) = \tilde{\rho}(\varepsilon_0) \tag{54}$$

[d10]

3) Let|Being ρ, σ be liftings of $\tilde{\rho}, \tilde{\sigma}$, we will then have

$$\varepsilon_0 = -\lambda_0\sigma^{-1}\rho, \quad \varepsilon_1 = -\lambda_0\rho\sigma^{-1} \tag{55}$$

for $\lambda_0 \in \Gamma G_m$ uniquely determined. For a suitable choice of ρ (when σ is already chosen) we can assume $\lambda_0 = 1$ (which determines ρ uniquely in [d12] terms of σ, and conversely) [p. 362]

$$\mathrm{Tr}(\rho+\sigma) \quad \text{invertible} \tag{57}$$

(cf. also proposition page 478' for other equivalent conditions).

5) For $\varepsilon_0, \varepsilon_1$ to be independent (in each fiber)[i2], it is necessary and sufficient that we [d2] can find (locally fppf)[i3] ρ, σ above $\tilde{\rho}, \tilde{\sigma}$ so as to satisfy (56) and

$$\mathrm{Tr}(\rho+\sigma) = 1 \qquad \text{i.e.} \quad \mathrm{Tr}\,\rho + \mathrm{Tr}\,\sigma = 1 \tag{57'}$$

and this determines ρ, σ uniquely (in terms of $\tilde{\rho}, \tilde{\sigma}, \tilde{\varepsilon}_0$).

$\rho+\sigma$ an elementary projector $\Longleftrightarrow$

Remarks 1) The conditions on (ρ, σ) considered in the proposition on page 478', and the normalization $u|v_1 = 1$ i.e. $\mathrm{Tr}(\sigma+\rho) = 1$ i.e. $\sigma+\rho$ elementary projector, are symmetric in (ρ, σ): they are satisfied for (ρ, σ) iff they are for (σ, ρ) — [d3] to be more[i4] precise let us put

$$\rho' = \sigma, \ \sigma' = \rho \qquad \varepsilon_0' = \underbrace{-\sigma'^{-1}\rho'}_{=-\rho^{-1}\sigma}, \quad \varepsilon_1' = \underbrace{-\rho'\sigma'^{-1}}_{-\sigma\rho^{-1}} \tag{58}$$

then we will have

$$\varepsilon_0' = \varepsilon_0^{-1}, \qquad \varepsilon_1' = \varepsilon_1^{-1}. \tag{59}$$

Likewise, (ρ^{-1}, σ^{-1}) satisfies the same conditions on page 478'[i5], and putting|taking

[scan 365]

$$\rho'' = \rho^{-1},\ \sigma'' = \sigma^{-1}, \qquad \varepsilon_0'' = \underbrace{-\sigma''^{-1}\rho''}_{-\sigma\rho^{-1}}, \quad \varepsilon_1'' = \underbrace{-\rho''\sigma''^{-1}}_{-\rho^{-1}\sigma} \tag{60}$$

we will have

$$\varepsilon_0'' = \varepsilon_{1|0}^{-1}, \qquad \varepsilon_1'' = \varepsilon_0^{-1}, \tag{61}$$

but we will take note that in general we will no longer have $\mathrm{Tr}(\rho'' + \sigma'') = 1$, but (by an immediate matrix calculation)

$$\mathrm{Tr}(\rho'' + \sigma'') = \mathrm{Tr}(\rho^{-1} + \sigma^{-1}) = -\frac{1}{v|\nu} = (\det \rho)^{-1} = (\det \sigma)^{-1} \tag{62}$$

(assuming of course already[i1] $v_1|u_1 = 1$ i.e. $\mathrm{Tr}(\rho + \sigma) = 1$) — this is equal to 1 only if

$$\det \rho\ (= \det \sigma) = 1 \tag{63}$$

— this is the condition of the section|relation 3°) of $(A1)_2|(41)_2$ (page 463'), which therefore also means that the normalization $v_1|u_1 = 1$ is stable under the transformation $\rho \mapsto \rho^{-1}$, $\sigma \mapsto \sigma^{-1}$.

On the other hand, the choice of the pinning associated with (ρ, σ) (i.e. $\tilde{\rho}, \tilde{\sigma}$) [in which the emphasis has been put on $\varepsilon_1 = -\rho\sigma^{-1}$, which receives the simple form

$$\varepsilon_1 = \begin{pmatrix} 1 & 0 \\ 1 & 1 \end{pmatrix},$$

whereas $\varepsilon_0 = -\sigma^{-1}\rho$[i2] has the more complicated form

$$\varepsilon_0 = \begin{pmatrix} 1 & v_1/v|u_1/v \\ 0 & 1 \end{pmatrix} \qquad \left(= \begin{pmatrix} 1 & -1 \\ 0 & 1 \end{pmatrix} \text{ in the modular case} \right)$$

] implicitly brings in the order in which we give ourselves ρ, σ — if we change it, we change the pinning by the change from ε_1 to $\varepsilon'_1 = \varepsilon_1^{-1}$.

In fact, the situation offered the choice between four "natural" pinnings, associated with the pair of

[p. 484]

one-parameter subgroups $\{L_0, L_1\}$, [d1] corresponding[i1] to the four sections $\varepsilon_0, \varepsilon_0^{-1}, \varepsilon_1, \varepsilon_1^{-1}$ of the one [d2] and of[i2] the other.

We preferred to normalize with the help of L_1, because of the most convenient form of the loop equation (which I finally arrived at moreover after some rather heavy peregrinations, where it is L_0 that I obstinately kept favoring in the formulas — cf. §44, the definitive notation appears only in §45 —. The preference given to [d3] $-\rho\sigma^{-1}$ (denoted ε_1) over its inverse $-\sigma\rho^{-1}$ (denoted ε_1^{-1}) comes from the preference (justified by the facts) given to ρ over $\sigma = \sigma_\infty$, in the loop formula written in the form

$$[\alpha, \rho] = [\beta, \sigma]\varepsilon_1(\nu)$$

instead of writing it

$$[\beta, \sigma] = [\alpha, \rho]\varepsilon'_1(\nu) \qquad (\varepsilon'_1 = \varepsilon_1^{-1})$$

So it is ε_1 that then deserved to have the simplest possible matrix form — we took

$$\varepsilon_1 = \begin{pmatrix} 1 & 0 \\ 1 & 1 \end{pmatrix} \ \ldots$$

2) In terms of the systems

$$\begin{array}{ccc} \tilde{\ell}'_\infty, & \tilde{\ell}'_1, & \tilde{\ell}'_0 \\ \| & \| & \| \\ \tilde{\rho}^{-1} & \tilde{\sigma} & \tilde{\varepsilon}_0 \end{array} \quad \text{satisfying} \quad \tilde{\ell}'_\infty \cdot \tilde{\ell}'_1 \cdot \tilde{\ell}'_0 = 1 \tag{64}$$

(i.e. $\tilde{\rho}^{-1} \cdot \tilde{\sigma} \cdot \tilde{\varepsilon}_0 = 1$ i.e. $\tilde{\varepsilon}_0 = \tilde{\sigma}^{-1}\tilde{\rho}$), the group $\mathfrak{S}'_3 | \mathcal{G}'_3$ operates on them (cf. §42 I) by cyclic permutations, and by the change into $(\tilde{\varepsilon}_0^{-1}, \tilde{\sigma}^{-1}, (\tilde{\rho}^{-1})^{-1} = \tilde{\rho})$, which in its turn by cyclic permutation gives $(\tilde{\sigma}^{-1}, \tilde{\rho}, \tilde{\varepsilon}_0^{-1})$ —

[scan 367]

the passage from $(\tilde{\rho}^{-1}, \tilde{\sigma}, \tilde{\varepsilon}_0)$ to $(\tilde{\sigma}^{-1}, \tilde{\rho}, \tilde{\varepsilon}_0^{-1})$ then corresponds to the interchange $(\rho, \sigma) \mapsto (\sigma, \rho)$. How [d1] to interpret the transformation $(\rho, \sigma) \mapsto (\rho^{-1}, \sigma^{-1})$, i.e. $(\tilde{\rho}^{-1}, \tilde{\sigma}, \tilde{\varepsilon}_0) \mapsto (\tilde{\rho}, \tilde{\sigma}^{-1}, \tilde{\varepsilon}_1)$?

Let us interpret the triples as homomorphisms.

$$\Pi_{0,3} \xrightarrow{\varphi|\psi} \Gamma PG$$

$$\ell_0 \longmapsto \ell'_0$$

$$\ell_1 \longmapsto \ell'_1$$

$$\ell_\infty \longmapsto \ell'_\infty$$

we see that the change $(\rho, \sigma) \mapsto (\sigma, \rho)$ corresponds to the composition of φ with the automorphism of $\Pi_{0,3}$ such that

$$\ell_0 \mapsto \ell_1^{-1} \qquad \ell_1 \mapsto \ell_0^{-1} \qquad \text{thus } \ell_\infty \mapsto \ell_\infty^{-1}$$

i.e. with $\underline{\tau'_\infty}$. Likewise the transformation $(\rho, \sigma) \mapsto (\rho^{-1}, \sigma^{-1})$ corresponds to composition with the automorphism

$$\ell_0 \mapsto \ell_0^{-1} \qquad \text{hence } \ell_\infty \mapsto \ell_0 \ell_1$$

$$\ell_1 \mapsto \ell_1^{-1}$$

, which is none other than $\underline{\tau_\infty} = \sigma_\infty \tau'_\infty$.

Thus the group of four transformations [d2] on the set of pairs (ρ, σ) that we considered in $\underline{1^\circ)}$ is interpreted [d3] [d4] as[i1] the subgroup $\simeq \mathbb{Z}/2\mathbb{Z} \times \mathbb{Z}/2\mathbb{Z}$ generated by $\tau'_\infty, \tau_\infty$ in $\mathrm{Aut}_{\mathrm{lac|ext}}(\Pi_{0,3}) = \mathfrak{S}'_{0,3} | \mathcal{G}_{0,3}$, which [d5] stabilizes $L_0 \subset \Pi_{0,3}$ (thus its action on the|this third factor $\tilde{\varepsilon}_0 = \ell'_0$ will be to preserve it or replace it by its inverse, [d6] which will have the virtue of [d7] preserving its unipotent character, which we care about !).

[p. 485]

VIII Recapitulation on the equation

$$[\alpha, \rho] = [\beta, \sigma]\varepsilon_1(\nu). \tag{1}$$

The groups [d1], $S\mathcal{G}^*_{\rho,\sigma}$ and its variants.

The essential result we have arrived at in (III), is the possibility of parametrizing the solutions of such an equation in α, β, ν[i1] (under suitable hypotheses on ρ, σ) by a group $B'_0 \times T_\rho \times T_\sigma$, where B'_0 is a "pre-Borel|pri-Borel" in G (taking, for a suitable basis, the form

$$B'_0 = \left\{ \begin{pmatrix} \mu & \lambda \\ 0 & 1 \end{pmatrix} \;\middle|\; \begin{array}{l} \mu \in \Gamma\mathbb{G}_m \\ \lambda \in \Gamma\mathbb{G}_a \end{array} \right.$$

and T_ρ, T_σ are the centralizers|stabilizers of the regular sections ρ, σ of G, by the morphism

$$\left\{ \begin{array}{ccc} B'_0 \times T_\rho \times T_\sigma & \longrightarrow & \mathcal{G}_{\rho,\sigma} \\ (\underline{u}, \underline{a}, \underline{b}) & \longmapsto & (\underline{ua}^{-1}, \underline{ub}^{-1}, \nu|\delta(\underline{u})) \end{array} \right. \tag{2}$$

(where the fact that $\nu(\underline{u}) = \det(\underline{u}) - 1$ is not of capital importance for the moment).

m1037

Marginal note. [m1037] We now start from $\rho, \sigma, B'_0, \varepsilon_1$ (hence L_1) and we ask the question under what conditions, one can have a parametrization (2).

[d2] To say[i2] that this morphism from the first|from the first ones into $G \times G \times E'$ [d3] maps[i3] indeed into the solutions of (1), [d4] means[i4] also that we have identically

$$\underline{u}\rho(\underline{u})^{-1} = \underline{u}\sigma(u)^{-1}\varepsilon_1(\underline{\nu}(u))$$

which can also be written, canceling $\underline{u}| =$ and taking inverses

$$\rho(\underline{u}) = \varepsilon_1(-\underline{\nu}(u))\sigma(\underline{u}). \tag{3}$$

The possibility of finding $\underline{\nu} : B'_0 \longrightarrow \mathbb{G}_a$ (morphism of schemes) will give|would give, via (2), a morphism $B'_0 \times T_\rho \times T_\sigma \longrightarrow \mathcal{G}_{\rho,\sigma}$ $\overset{\text{dfn}}{=}$ scheme

[scan 369]

of solutions of (1), is therefore equivalent to that d1 d2 σ and ρ d3 the same action on B'_0, modulo multiplication on the left by d4 the subgroup d5 unipoten^{ti1} with one parameter L_1 which enters into the very writing of the equation (1) we are studying. This is hard to conceive unless one admits that $L_1 \subset \rho(B'_0) \overset{\text{df}}{=} B'_1$, which moreover implies $\sigma(B'_0) \subset B'_1$ (and by a known argument $\sigma(B'_0) = B'_1$) and $L_1 = (B'_1)_u$. Conversely, if we have $\rho(B'_0) = \sigma(B'_0)$, d6 i.e. σ^{-1}i2d7ρ normalizes B'_0, d8 i.e. $\sigma^{-1}\rho$ a section of B_0, then $\sigma(u) = \sigma u \sigma^{-1}$ and $\rho(u) = \rho u \rho^{-1}$ are two sections of B'_1 which have the same determinant – hence abelianizatio^{n}, hence which do coincide modulo $(B'_1)_u$.

Thus we see that the essential property for obtaining solutions of (1) via (2), is to have

$$(4) \qquad (\sigma^{-1}\rho)(B'_0) = B'_0 \qquad \text{i.e.} \quad \sigma^{-1}\rho \in \Gamma B_0 \,..$$

m1038

Marginal note. m1038 N.B. This condition (if $\sigma^{-1}\rho$ regular, i.e. ρ and σ are not homothetic in any fiber), practically determines B_0 – d9 over a field, there is an ambiguity possible between|of order two (the two Borels containing the element in question).

For uniqueness of the representation of a triple (α, β, ν) in the form $(ua^{-1}, ub^{-1}, \nu(u))$, it is necessary d10 and it^{i3} suffices that we have

$$(5) \qquad T_\sigma \cap T_\rho \cap B'_0 = \{1\},$$

m1039

Marginal note. m1039 It suffices for example that we have $T_\rho \cap T_\sigma = G_m$ and $G_m \cap B'_0 = \{1\}$.

d11 the indeterminacy is

[p. 486]

in the form

$$(\underline{u}, \underline{a}, \underline{b}) \longmapsto (\underline{u}\underline{l}, \underline{a}\underline{l}, \underline{b}\underline{l})$$

, with l a section of $T_\rho \cap T_\sigma \cap B'_0$. There remains the question of the surjectivity of (2) – can every solution of (1) indeed be written in the form $(ua^{-1}, \underline{u}b^{-1}, \nu(\underline{u}))$? It amounts to the same (if ρ, σ are regular) to say that [d1] we have surjectivity in

$$(6) \qquad \begin{array}{ccc} B'_0 & \longrightarrow & \mathcal{X}_{\rho,\sigma} \\ \underline{u} & \longmapsto & ([\underline{u}, \rho], [\underline{u}, \sigma], \underline{\nu}(\underline{u})) \end{array}$$

where $\mathcal{X}_{\rho,\sigma}$ is the scheme of simultaneous solutions [d2] in [d3] ζ, η, ν of

$$(7) \qquad \det \zeta = \det \eta = 1, \quad \operatorname{Tr} \zeta\rho = \operatorname{Tr} \rho, \quad \operatorname{Tr} \eta\sigma = \operatorname{Tr} \sigma, \quad \zeta = \eta\varepsilon_1(\nu).$$

It was essentially to obtain this surjectivity that we had been led in section (II) to make the draconian hypotheses (pages 435',436) which are expressed, at the cost of an étale, by the conditions [d4]

$$(8) \qquad \begin{cases} \text{a)} & \sigma^{-1}\rho \text{ a section of } (B_0)_u = L_0 \quad \text{(and not only of } B_0\text{)} \\ \text{b)} & B_0 \text{ and } B_1 = \rho(B_0) = \sigma(B_0) \text{ in "general position",} \\ & \text{i.e. } L_0 \text{ and } L_1 = \rho(L_0) = \sigma(L_0) \text{ independent;} \\ & \text{(in each fiber)} \end{cases}$$

but it is not clear whether these conditions (suggested by earlier calculations, and indeed giving rise to some|some very pretty calculations) are really indispensable for the result of parametrizati-

[scan 371]

In our context it is quite[i1] natural to assume $\varepsilon_0 = \sigma^{-1}\rho| - \sigma^{-1}\rho$ unipotent (or at least quasi-unipotent, i.e. [d1] an iterate ε_0^n unipotent) but condition b) of (8), more subtle, appears less imperative. The sequel will show whether this restriction is judicious.

In the case where one considers an equation

$$(9) \qquad \underbrace{[\alpha, \rho]}_{\zeta} = \varepsilon \underbrace{[\beta, \sigma]}_{\eta} \varepsilon_1(\nu)$$

with a parameter ε (which can in particular take the important value -1) $\in \Gamma\mu_2$, one|where we have for the first time in these calculations destroyed the symmetry between ρ and σ, by introducing the condition $\operatorname{Tr}\sigma = 0$ as a condition of stability of the scheme $\mathcal{X}_\sigma$[i2] of the η satisfying

$$\det\eta = 1, \qquad \operatorname{Tr}\eta\sigma = \operatorname{Tr}\sigma$$

under μ_2. The essential result we were after, was the isomorphism

$$B'_0 \times T_\rho \times N'_\sigma \xrightarrow{\sim} \mathcal{G}^*_{\rho,\sigma} \tag{10}$$

$$(\underline{u}, \underline{a}, \underline{b}) \longmapsto (\alpha = \underline{u}\underline{a}^{-1}, \beta = \underline{u}\underline{b}^{-1}, \mu = \det\underline{u}, \varepsilon = \varepsilon(\underline{b}))$$

where $N'_\sigma \subset N_\sigma$ is now the normalizer of T_σ – defined by the condition

$$(11). \qquad \underline{b}\,\sigma(\underline{b})^{-1} = \varepsilon(\underline{b}) \qquad \text{i.e.} \quad \underline{b}(\sigma) = \varepsilon(\underline{b})\sigma$$

[p. 487]

That the morphism (10) does map into $\mathcal{G}^*_{\rho,\sigma}$, is trivial by definition of N'_σ and via the analogous fact for (2) – without a hypothesis of the kind $\operatorname{Tr}\sigma = 0$. But the possibility of obtaining (local[ly]) any ε via a $\underline{b} \in \Gamma N'_\sigma$ – or simply $\varepsilon = -1$, if 2 invertible) requires precisely $\operatorname{Tr}\sigma = 0$.

Of course, we are going to consider $\mathcal{G}^*_{\rho,\sigma}$ as a group scheme, by transport of structure from the product group structure of $B'_0 \times T_\rho \times N'_\sigma$. We single out in it the subgroup

$$(12) \qquad \mathcal{G}^{\flat|b*}_{\rho,\sigma}(0) \quad \text{corresponding to :} \quad T'_0 \times T_\rho \times N'_\sigma$$

where

$$(13) \qquad T_0 = B'_0 \cap B'_1$$

is the distinguished maximal torus of B'_0, which [d1] the canonical pinning is described as

$$(14) \qquad T_0 = \left\{ \begin{pmatrix} \mu & 0 \\ 0 & 1 \end{pmatrix} \right| \mu \in \Gamma G_m \Big\}.$$

We likewise set

$$(15) \qquad \mathcal{G}^{\flat|b}_{\rho,\sigma}(0) = \mathcal{G}_{\rho,\sigma} \cap \mathcal{G}^{*\flat|b}_{\rho,\sigma}(0), \quad \text{corresponding to :} \; T'_0 \times T_\rho \times T_\sigma$$

[p. 371]

Apparatus for this scan

140-3-s372-D001 *deletion. Manuscript:* for our
Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 373]

We shall thus have semidirect product structures

$$(16) \qquad \mathcal{G}_{\rho,\sigma} \simeq \mathcal{G}^{\flat|b}_{\rho,\sigma}(0) \cdot \Lambda_0, \qquad \mathcal{G}^{*}_{\rho,\sigma} \simeq \mathcal{G}^{*\flat|b}_{\rho,\sigma}(0) \cdot \Lambda_0,$$

where

$$(17) \qquad \begin{cases} \Lambda_0 \subset \mathcal{G}_{\rho,\sigma}, \quad \Lambda_0 = \left\{ \left(\alpha = \underset{\varepsilon_0^{n|u}}{\lambda}, \beta = \underset{\varepsilon_0^{n|u}}{\lambda}, \mu = 1 \right) \middle| \lambda \in \Gamma L_0 \right\} \\ \qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad (n|u \in \Gamma G_a) \\ \text{corresponding to:} \quad L_0 \times \{1\} \times \{1\} \subset B'_0 \times T_\rho \times T_\sigma. \end{cases}$$

We shall finally consider another subgroup scheme[i1] of $\mathcal{G}^{*}_{\rho,\sigma}$, by the conditions

$$(18) \qquad \begin{cases} \det \alpha \in \Gamma\mu_2 \quad \text{i.e. } (\det \alpha)^2 = 1 \\ \det \beta = 1 \end{cases} \quad \Big| \quad \text{whence } S\mathcal{G}^{*|\flat}_{\rho,\sigma} \subset \mathcal{G}^{*}_{\rho,\sigma}$$

[d1] Remark[i2] [d2] $S\mathcal{G}^{*}_{\rho,\sigma}$ can be interpreted as the scheme of systems

$$(\alpha, \beta, \mu, \varepsilon, \varepsilon')$$

satisfying

$$(19) \qquad [\alpha, \rho] = \varepsilon[\beta, \sigma]\varepsilon_1(\mu - 1), \quad \det \alpha = \varepsilon', \quad \det \beta = 1, \quad \underline{\varepsilon^2 = \varepsilon'^2 = 1}$$

m1040

Marginal note. [m1040] N.B. $\varepsilon^2 = 1$ already follows from the first relation.

In terms of the systems

$$(\underline{u}, \underline{a}, \underline{b}) \in \Gamma B'_0 \times T_\rho \times N'_\sigma$$

the equations (19) (of which the first|first is automatic), reduce to:

$$(20) \qquad \det \underline{u} = \det \underline{b} = \varepsilon' \det \underline{a}, \qquad \varepsilon'^2 = 1,$$

[p. 488] which show that $S\mathcal{G}^*_{\rho,\sigma}$ is indeed[i1] a subgroup of $\mathcal{G}^*_{\rho,\sigma}$. This subgroup contains Λ_0 (corresponding: $L_0 \times \{1\} \times \{1\}|\{(1,1)\} \subset B'_0 \times T_\rho \times N'_\sigma$) — which corresponds to the case where [d1]

$$\det \underline{u} = \det \underline{b} = \det \underline{a} = 1 \qquad (\varepsilon' = 1), \tag{21}$$

and we have a $\frac{1}{2}$ direct product structure

$$S\mathcal{G}^*_{\rho,\sigma} \simeq S\mathcal{G}^{*\flat|b}_{\rho,\sigma}(0) \,.\, \Lambda_0 \tag{22}$$

where

$$S\mathcal{G}^*_{\rho,\sigma}(0) = S\mathcal{G}^*_{\rho,\sigma} \cap \mathcal{G}^{*\flat|b}_{\rho,\sigma}(0) \tag{23}$$

corresponds to the subgroup|subgroup [d2] $T_0|T'_0 \times T_\rho \times N'_\sigma$ [d4] defined by the same equations (20). Of course, we shall also have

$$S\mathcal{G}_{\rho,\sigma}, \quad S\mathcal{G}^{\flat|b}_{\rho,\sigma}(0) \quad (\text{without } *) \tag{24}$$

[d5] intersections[i2] of $S\mathcal{G}^*_{\rho,\sigma}$, $S\mathcal{G}^{\flat|b*}_{\rho,\sigma}(0)$ with $S\mathcal{G}_{\rho\sigma}$ — deduced from the expression of these in terms of $(B'_0, T_0|T'_0), T_\rho, N'_\sigma$ by replacing N'_σ with T_σ.

To make explicit the structure of the $S\mathcal{G}^*_{\rho,\sigma}$, we are reduced via (22) to studying the group

$$(25) \quad S\mathcal{G}^{*\flat|b}_{\rho,\sigma}(0) \hookrightarrow T_0|T'_0 \times T_\rho \times N'_\sigma$$ [p. 373]

[scan 375]

described by equations (20). But we have

$$T_0 \xrightarrow{\sim} \mathbb{G}_m$$

$$\underline{u} \longmapsto \det \underline{u}$$

, which implies that the projection

$$S\mathcal{G}^{*\flat|\flat}_{\rho,\sigma}(0) \longrightarrow T_\rho \times N'_\sigma$$

$$\begin{array}{ccc} (\underline{ua}^{-1}, \underline{ub}^{-1}, \det \underline{u}, \varepsilon = \varepsilon(\underline{b})) & \longrightarrow & (\underline{a}, \underline{b}) \\ \wr & & \\ (\underline{u}, \underline{a}, \underline{b}) & & \end{array}$$

is a monomorphism, and induces an isomorphism of $S\mathcal{G}^{*}_{\rho,\sigma}(0)$ onto the subgroup|subgroup of $T_\rho \times N'_\sigma$ defined|defined by the equation

$$\det \underline{b} = \varepsilon' \det \underline{a}, \qquad \varepsilon'^2 = 1 \tag{21}$$

we shall have

$$(\det \underline{b})^2 = (\det \underline{a})^2.$$

In terms of the homomorphisms (determinants, in short)

$$T_\rho \xrightarrow{\delta_\rho} \mathbb{G}_m, \qquad N'_\sigma \xrightarrow{\delta_\sigma} \mathbb{G}_m$$

this amounts to taking the inverse image of the diagonal of $\mathbb{G}_m \times \mathbb{G}_m$ [i1] under $\delta_\rho^2, \delta_\sigma^2$.
We see at once (since $\delta_\rho, \delta_\sigma$ are epimorphisms) that the homomorphism

$$(22) \quad S\mathcal{G}^{*\flat|\flat}_{\rho,\sigma}(0) \longrightarrow \mu_2 \times \mu_2$$

$$(\alpha, \beta, \mu, \varepsilon, \varepsilon') \longmapsto (\varepsilon, \varepsilon')$$

$$\text{i.e.} \quad (\underline{u}, \underline{a}, \underline{b}) \longmapsto \left(\underline{\varepsilon}(\underline{b}), \underbrace{\det \underline{b} / \det \underline{a}}_{\det(\underline{ba}^{-1})} \right)$$

is an epimorphism, and [d1] thus gives rise to an exact sequence [p. 374]

[p. 489]

$$(23)\quad 1 \to S\mathcal{G}^{*\circ\flat|b}_{\rho,\sigma}(0) \to S\mathcal{G}^{*\flat|b}_{\rho,\sigma}(0) \to \mu_2 \times \mu_2 \to 1$$

where $S\mathcal{G}^{\circ\flat|\circ}_{\rho,\sigma}(0)$ is isomorphic to the subscheme of $T_\rho \times T_\sigma$ defined by the equation

$$\det \underline{a} = \det \underline{b} \tag{24}$$

and thus in turn breaks down into

$$(25)\quad 1 \to ST^{\flat|b}_\rho \times ST^{\flat|b}_\sigma \to S\mathcal{G}^{\circ\flat|b}_{\rho,\sigma}(0) \longrightarrow \mathbb{G}_m \longrightarrow 1$$

$$(\underline{a}, \underline{b}) \longmapsto \det \underline{a} = \det$$

where we have set

$$\begin{cases} ST^{\flat|b}_\rho = \mathrm{Ker}\left(T_\rho \xrightarrow{\delta_\rho} \mathbb{G}_m\right) \\ ST^{\flat|b}_\sigma = \mathrm{Ker}\left(T_\sigma \xrightarrow{\delta_\sigma} \mathbb{G}_m\right) \end{cases} \tag{26}$$

If for example ρ (non-s|non-g)[i1] is $\frac{1}{2}$ simple, hence T_ρ a maximal torus, then $ST^{\flat|b}_\rho$ is itself a torus (of dimension 1)[i2] — ditto for σ. Thus, [d3] in the "modular case"

$$\rho = \begin{pmatrix} 0 & 1 \\ -1 & 1 \end{pmatrix}, \qquad \sigma = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix},$$

$ST^{\flat|b}_\rho$ is a torus [d4] except in characteristic 3, and $ST^{\flat|b}_\sigma$ a torus except in characteristic 2. Thus, except in characteristic 2,3, $S\mathcal{G}^{\circ\flat|b}_{\rho,\sigma}(0)$ is a torus of dimension 3.

To finish determining the structure of $S\mathcal{G}^*_{\rho,\sigma}$ in terms of $\mathcal{G}^{*\circ}_{\rho,\sigma}(0)$ and of the decomposition (22) as a semidirect product, we must [d5]make explicit[i4] the operation of [p. 375]

watch the factor ε!

Proposition The morphism of schemes Θ is characterized by formulas (29), modulo a morphism $\mathcal{G}^*_{\rho,\sigma} \xrightarrow{\lambda} \mu_2$.

Indeed, the first two formulas, which describe the action of $\underline{u}$ on ρ resp. σ, determine $\underline{u}$ modulo T_ρ resp. modulo T_σ, hence (together)[i1] modulo $T_\rho \cap T_\sigma = \mathbb{G}_{\mathrm{m}}$, the third determines it modulo SG, – hence with the preceding ones, modulo μ_2 – i.e. another morphism Θ' having the same properties will be of the form

$$\Theta'(g) = \lambda(g)\Theta(g) \qquad \text{where } \lambda : \mathcal{G}^*_{\rho,\sigma} \longrightarrow \mathcal{E}_2|\varepsilon_2.$$

q.e.d.

Remark Let us note moreover[i2] that [d1] Θ is normalized by

$$\Theta(\underbrace{1,1,1,1}_{1}) = 1$$

which imposes [d2] [d3]corresponding[i3] normalization $\lambda(1) = 1$; on λ – but unless I am mistaken this already implies (at least if ρ, σ are $\frac{1}{2}$ simple hence T_ρ, T_σ tori…) that λ is a homomorphism of group schemes, which here is necessarily trivial, on the component[i4] $B'_0 \times T_\rho \times T_\sigma$ (at least in characteristic $\neq 2$) so we find essentially as the only possible indeterminacy the multiplication [d4] of $\underline{u}$ by ε [d5] (corresponding to the canonical[i5] homomorphism (nontrivial) from N'_σ/T_σ onto μ_2)… [d6]

m1042

Marginal note. [m1042] If we worked with $S\mathcal{G}_{\rho,\sigma}$ instead of $\mathcal{G}^*_{\rho,\sigma}$, the indeterminacy would be given by multiplication by$\vert\mapsto \varepsilon^i\varepsilon'^j$ $(i, j \in \mathbb{Z}/2\mathbb{Z})$.

[scan 379]

[p. 490]

(IX) The groups $\mathcal{M}_{\rho,\sigma}$ and $S\mathcal{M}_{\rho,\sigma}$.

Let ρ, σ be as always two sections of G, satisfying the general conditions (cf. for example proposition page 478'|470'), plus the condition $\operatorname{Tr}\sigma = 0$ (cf. V – for example lemma page 455 and its corollary page 457) – we could carry out their construction also without this additional condition (contenting ourselves with working with $\mathcal{G}_{\rho,\sigma}$ instead of $\mathcal{G}^*_{\rho,\sigma}$) – but it matters little probably for what follows. We can if need be suppose ρ, σ normalized so that we have $\operatorname{Tr}(\rho+\sigma) = 1$.

We denote by $S\mathcal{M}_{\rho,\sigma}$ the product scheme

$$(1) \qquad S\mathcal{M}_{\rho,\sigma} = S\mathcal{G}^*_{\rho,\sigma} \times_S SG$$

m1044

Marginal note. m1044 In|For what follows, the "officialization" [illeg. 1] of the group schemes|structures $S_0\mathcal{M}_{\rho,\sigma}$, cf. page 559 ff.

Its sections are denoted

$$(\alpha, \beta, \mu, \varepsilon, f) \ ;$$

f thus being an arbitrary section of SG ($\simeq \mathrm{Sl}(2)_S$).

In the case where $S = \operatorname{Spec}(A)$, $A = \widehat{\mathbb{Z}}$,

$$G = \mathrm{Gl}(2)_S, \quad \rho = \begin{pmatrix} 0 & 1 \\ -1 & 1 \end{pmatrix}, \quad \sigma = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix},$$

and where we thus have a canonical homomorphism

$$(2) \qquad \widehat{\mathcal{G}|\mathcal{C}}_{0,3} \longrightarrow G(\widehat{\mathbb{Z}})'^{\pm 1} \simeq \mathrm{Gl}|\mathrm{Sl}(2, \widehat{\mathbb{Z}})^{\pm 1}/\{\pm 1\}$$

with values in the subgroup of elements|elements of determinant ± 1, 378

[scan 380]

sending $\widehat{\mathcal{G}|\mathcal{C}}^{+}_{0,3}$ into $SG(\widehat{\mathbb{Z}})' = \mathrm{Sl}(2,\widehat{\mathbb{Z}})' = \mathrm{Sl}(2,\widehat{\mathbb{Z}})/\{\pm 1\}|\pm 1$, we are going to construct a variant of the group $\mathcal{M}^{\sim}_{0,3}$, (cf. page 390)[i1], which maps canonically into the product (1), which will lead us to define a group structure on $S\mathcal{M}_{\rho,\sigma}$, so as to make the said morphism multiplicative.

Let us first consider the "special" variant $S\mathcal{M}^{\sim}_{0,3}$ of $\mathcal{M}^{\sim}_{0,3}$, an extension of $\mathcal{M}^{\sim}_{0,3}$ by $\widehat{\mathbb{Z}}^3$, deduced from an extension of

$$\mathcal{A}|\mathcal{H}^{\sim}_{0,3} = \mathcal{M}^{\sim}_{0,3}/\widehat{\Pi}_{0,3} \subset \widehat{\widehat{\mathcal{T}}}_{0,3}|\widehat{\mathcal{T}}_{0,3},$$

[d1] and even from an extension of $\widehat{\widehat{\mathcal{T}}}_{0,3}|\widehat{\mathcal{T}}_{0,3}$ (via $\mathcal{M}^{\sim}_{0,3} \longrightarrow \widehat{\widehat{\mathcal{T}}}_{0,3}|\widehat{\mathcal{T}}_{0,3}$), consisting of the

$$(3) \qquad (u, f_0|g_0, f_1|g_1, f_\infty|g_\infty) \qquad \left(u \in \widehat{\widehat{\mathcal{T}}}_{0,3}|\widehat{\mathcal{T}}_{0,3}, \quad g_0, g_1, g_\infty \in \widehat{\Pi}_{0,3}\right)$$

satisfying

$$(4) \qquad u(\ell_i) = \mathrm{int}(f|g^{-1}_{\dot{u}(i)})(\ell^{\mu}_{\dot{u}(i)})$$

where μ is the multiplier of u, and $\dot{u}$ the action of u on the set[i2] $\{0,1,\infty\}$ of loop classes. The product is defined by

$$(5) \qquad \begin{aligned}&(u', f'_0, f'_1, f'_\infty)(, f_0, f_1, f_\infty)\\ &= (u'u,\ f'_0u'(f_0),\ f'_1u'(f_1),\ f'_\infty u'(f_\infty))\end{aligned}$$

restricting ourselves (deflation!) to the case $u, u' \in \mathcal{M}^{!\sim}_{0,3}$ i.e. $\dot{u}, \dot{u}' = 1$. 379

[scan 381]

[p. 491]

We have a surjective homomorphism $S\mathcal{M}^{\sim}_{0,3} \longrightarrow \mathcal{M}^{\sim}_{0,3}$, whose kernel consists of the

$$(6) \qquad (1, f_0, f_1, f_\infty) \qquad f_i \in L_i$$

thus we have

$$(7) \qquad 1 \longrightarrow \widehat{\mathbb{Z}}^3 \longrightarrow S\mathcal{M}^{\sim}_{0,3} \longrightarrow \mathcal{M}^{\sim}_{0,3} \longrightarrow 1$$

We are going to define an interesting subgroup

$$(8) \qquad S_0\mathcal{M}^{\sim}_{0,3} \subset \mathcal{M}^{\sim}_{0,3},$$

now using the definition of $\mathcal{M}^{\sim}_{0,3}$, namely via[i1] the property of the $u \in \mathcal{M}^{\sim}_{0,3}$ of commuting with ρ as outer actions, so that we will have

$$(9) \qquad u\rho u^{-1} = g\rho \qquad \text{i.e. } [u,\rho] = g, \quad g \in \widehat{\Pi}_{0,3}$$

This allows us, when we have already chosen $f_i \in \widehat{\Pi}_{0,3}$ satisfying

$$(10) \qquad u(\ell_i) = \mathrm{int}(f_i^{-1})(\ell_i^{\mu})$$

(supposing for simplicity $u \in \mathcal{M}_{0,3}^{!\sim}$), to deduce from it the [d1] f_{i+1}, f_{i+2} via the formula

$$(11) \qquad f_{i+1}^{-1} = g\rho(f_i^{-1})\,, \qquad \begin{bmatrix} \text{and } f_{i+2}^{-1} = g\rho(f_{i+1}^{-1}) \\ \qquad\qquad = g\rho(g)\rho^2(f_i^{-1}) \end{bmatrix}$$
$$[\text{where } g = [u,\rho] \in \widehat{\Pi}_{0,3})$$

(we have set $\dot\rho(i) = i+1$ by abuse of language, i.e. $0+1=1,\ 1+1=\infty,\ \infty+1=0$!) – we then recover|will recover

$$f_i^{-1} = f|g^{-1}_{(i+2)+1} = g\rho(f_{i+2}^{-1}) = \underbrace{g\rho(g)\rho^2(g)}_{1}\ \underbrace{\rho^3(f_i^{-1})}_{f_i^{-1}}\,.$$

[scan 382]

[p. 492]

The $(u, f_0, f_1, f_\infty) \in S\mathcal{M}_{0,3}^{!\sim}$ which satisfy (11) for $\forall\ i \in \{0,1,\infty\}$ (it suffices that it satisfy it|them for two indices, for this to be satisfied for all three) form a subgroup of $S\mathcal{M}_{0,3}^{!\sim}$, which I denote $S_0\mathcal{M}_{0,3}^{!\sim}$ – it also identifies with the group of pairs (u, f_0) $(u \in \mathcal{M},\ f_0 \in \widehat{\Pi}_{0,3})$ satisfying

$$(12) \qquad u(\ell_0) = \mathrm{int}(f_0^{-1})(\ell_0^{\mu}) \qquad (\text{where } \mu = \chi(u)).$$

We have an extension structure

$$(13) \qquad 1 \longrightarrow \widehat{\mathbb{Z}} \longrightarrow S_0\mathcal{M}_{0,3}^{!\sim} \longrightarrow \mathcal{M}_{0,3}^{!\sim} \longrightarrow 1\ ,$$

and a homomorphism of extensions

$$(14) \qquad \begin{cases} 1 \longrightarrow \widehat{\mathbb{Z}} \longrightarrow S_0\mathcal{M}_{0,3}^{!\sim} \longrightarrow \mathcal{M}_{0,3}^{!\sim} \longrightarrow 1 \\ \qquad\quad \downarrow \text{diagonal} \qquad\ \downarrow \qquad\ \Downarrow \\ 1 \longrightarrow \widehat{\mathbb{Z}}^3 \longrightarrow S\mathcal{M}_{0,3}^{!\sim} \longrightarrow \mathcal{M}_{0,3}^{!\sim} \longrightarrow 1 \end{cases}$$

(where $S\mathcal{M}^{!\sim}_{0,3}$ is defined as[i2] the reverse|inverse image of $\mathcal{M}^{!\sim}_{0,3}\subset\ |\ \in\mathcal{M}^{\sim}_{0,3}$ in $S\mathcal{M}^{\sim}_{0,3}$). We can therefore say that the extension $S\mathcal{M}^{!\sim}_{0,3}$ (of $\mathcal{M}^{!\sim}_{0,3}$ by $\widehat{\mathbb{Z}}^3$) is deduced, by the diagonal homomorphism

$$(15)\qquad \begin{array}{ccc}\widehat{\mathbb{Z}} & \longrightarrow & \widehat{\mathbb{Z}}^3\\ \underline{n} & \longmapsto & (\underline{n}_0=\underline{n},\ \underline{n}_1=\underline{n},\ \underline{n}_\infty=\underline{n})\end{array},$$

from a "finer" extension $S_0\mathcal{M}^{!\sim}_{0,3}$ of 381

$\mathcal{M}^{!\sim}_{0,3}$ by $\widehat{\mathbb{Z}}$.

The calculations of §46 V (page 407 and following) make it possible on the other hand to make explicit the pairs $(u|\alpha, f_0=f)$ in terms of systems

$$(16)\qquad (\alpha,\beta,f)\ \Big|\ \begin{array}{c}\alpha\in\widehat{\widetilde{\Pi}}_{0,3}=\widehat{\Pi}_{0,3}\cdot\{1,\tau_\infty\}=\text{inverse image|inverse image of }\{1,\tau\}\\ \text{under }\widehat{\mathcal{G}|\mathcal{C}}_{0,3}\longrightarrow\mathcal{T}_{0,3}\\ \beta,f\in\widehat{\Pi}_{0,3}\end{array}$$

m1049

Marginal note. [m1049] to (u,f) we associate (fu,f) by putting $fu\in\mathcal{M}^{!\sim}_{0,3}[0]$ in the form $u_{\alpha,\beta}$

satisfying relations (not involving f)

$$(17)\qquad \alpha\rho(\alpha)^{-1}=\beta\sigma(\beta)^{-1}\ \underbrace{\varepsilon_1(\mu-1)}_{=\ell_1|h^\nu\text{ if }\mu-1=2\nu}$$

where $\mu\in\widehat{\mathbb{Z}}^*$ is defined [d1] ambiguity|unambiguously by α — and even from knowledge alone [d2] of $\xi=\underline{\alpha}\rho(\underline{\alpha})^{-1}$, where $\underline{\alpha}$ is the image of α in $\mathrm{Gl}(2,\widehat{\mathbb{Z}})^{\pm1}$.

The case $f=1$ corresponds to a[i1] subgroup of $S_0\mathcal{M}^{!\sim}_{0,3}$, which is identified with the normalizer of L_0 in $\mathcal{M}^{!\sim}_{0,3}$, which we had denoted $\mathcal{M}^{!\sim}_{0,3}[0]$ (§46 V ...) :

$$(18)\qquad \underset{\substack{\|\ \text{dfn}\\ \mathrm{Norm}_{\mathcal{M}^{!\sim}_{0,3}}(L_0)}}{\mathcal{M}^{!\sim}_{0,3}[0]}\ \simeq\left\{(\alpha,\beta,f)\ \middle|\ \begin{array}{l}f=1,\ \alpha,\beta\\ \text{satisfying (17)}\end{array}\right\}\subset S_0\mathcal{M}^{!\sim}_{0,3}.$$

If we denote by $u_{\xi,\eta}|u_{\alpha,\beta}$ [d3] [d4] or simply u_ξ the automorphism defined in terms of

$$(19)\qquad \xi=\alpha\rho(\alpha)^{-1},\qquad \eta=\beta\sigma(\beta)^{-1}$$

[scan 384]

[p. 493] by

$$(20) \qquad u(\rho) = \xi\rho, \qquad u(\sigma) = \eta\sigma$$

(N.B. η is defined in terms of ξ thanks to (17), where $\mu = \mu(\xi)$ is determined by ξ), we will have by construction (loc. cit.)

$$(21) \qquad u_{\alpha,\beta,f} = \mathrm{int}(f^{-1})u_{\alpha,\beta}$$

and to the triple (α, β, f) corresponds the element $(u_{\alpha,\beta,f}, f)$ of $S_0\mathcal{M}^{!\sim}_{0,3}$:

$$(22) \qquad (\alpha, \beta, f) \longmapsto (u_{\alpha,\beta}, f) \in S_0\mathcal{M}^{!\sim}_{0,3}.$$

Having thus made the elements of $S_0\mathcal{M}^{!\sim}_{0,3}$ explicit, we define a map

$$S_0\mathcal{M}^{!\sim}_{0,3} \longrightarrow S\mathcal{M}_{\rho,\sigma}(\widehat{\mathbb{Z}})' = S\mathcal{G}^*_{\rho,\sigma}(\widehat{\mathbb{Z}})' \times \mathrm{Sl}(2,\widehat{\mathbb{Z}})'$$

$$(23) \qquad (\alpha, \beta, f) \longmapsto \left(\underline{\alpha}, \underline{\beta}, \mu = \mu(\underline{\xi} = \underline{\alpha}\rho(\underline{\alpha})^{-1}), \underset{\uparrow}{\varepsilon_2(\mu)}, \underline{f}\right)$$
$$\varepsilon$$

where the underlined $\underline{\alpha}, \underline{\beta}, \underline{f}$ & denote the images of α, β, f in $\mathrm{Sl}(2,\widehat{\mathbb{Z}})'$, and the "accent" $'$ in $S\mathcal{M}_{\rho,\sigma}(\widehat{\mathbb{Z}})'$ denotes the set of [d1] systems[i2] $(\underline{\alpha}, \underline{\beta}, \mu, \varepsilon, \underline{f})$ [d2]

$$\in \mathrm{Gl}(2,\widehat{\mathbb{Z}})'^{\pm 1} \times \mathrm{Sl}(2,\widehat{\mathbb{Z}})' \times \widehat{\mathbb{Z}}^* \times \{\pm 1\} \times \mathrm{Sl}(2,\widehat{\mathbb{Z}})'$$

satisfying in $\mathrm{Sl}(2,\widehat{\mathbb{Z}})$ (not in $\mathrm{Sl}(2,\widehat{\mathbb{Z}})'$!),[i4] the loop relation [d3]

$$(24) \qquad \underline{\alpha}\rho(\underline{\alpha})^{-1} = \varepsilon\underline{\beta}\sigma(\underline{\beta})^{-1}\varepsilon_1(\mu - 1)$$

(which does not depend on the choices of signs ...) 383

[scan 385]

We have "done what was needed" so that the restriction of (23) to $\mathcal{M}^{!\sim}_{0,3}[0]$ ((18), identified with the (α,β,f) for which $f=1$) is a homomorphism into the group $S\mathcal{G}_{\rho,\sigma}$ [i1] — by defining precisely in a clever way ad hoc [i2] the composition law in $S\mathcal{G}^*_{\rho,\sigma}$. I am going to recheck it all the same to reassure myself, by considering $u=u_{\alpha,\beta}$, $u'=u_{\alpha',\beta'}$, $u''=uu'$ in the form $u_{\alpha'',\beta''}$, and recalling the "cocycle relation" which gives, up to one of the two signs, (α'',β'') in terms of $(\alpha',\beta'),(\alpha,\beta)$ (§46 II 5°))

$$(25)\qquad \alpha''=u'_{\infty|\omega}(\alpha)\alpha',\qquad \beta''=u'(\beta)\beta',\qquad \text{in addition to } \mu''=\mu\mu'$$

Let then|therefore $\underline{\alpha},\underline{\beta},\underline{\alpha}',\underline{\beta}'$ be [d2] elements [i4] of $\mathrm{Gl}(2,\widehat{\mathbb{Z}})^{\pm1}$ (determined up to sign) which lift the images of $\alpha,\alpha',\beta,\beta'$ in $\mathrm{Gl}(2,\widehat{\mathbb{Z}})'$, we will therefore have $(\underline{\alpha},\underline{\beta},\mu,\varepsilon_2(\mu))$ and $(\underline{\alpha}',\underline{\beta}',\mu',\varepsilon_2(\mu'))$ in $S\mathcal{G}^*_{\rho,\sigma}(\widehat{\mathbb{Z}})$, and applying Θ we find $\underline{u},\underline{u}'\in\mathrm{Gl}(2,\widehat{\mathbb{Z}})$ (in fact, $\in B'_0(\widehat{\mathbb{Z}})$) such that

$$(26)\qquad \begin{cases}\underline{u}'(\rho)=\mathrm{int}(\underline{\alpha}')\rho\quad \underline{u}'(\sigma)=\varepsilon_2(\mu')\,\mathrm{int}(\underline{\beta}')(\sigma)\\ \det\underline{u}'=\mu'\end{cases}$$

(and relations item|idem for u) and we will then have, for every $x\in\widehat{\mathcal{G}|\mathcal{C}}_{0,3}$

$$(27)\qquad \underline{u'(x)}=\underline{u}'(\underline{x})$$

(cf. ...) Thus, for [d4] suitable liftings $\underline{\alpha}'',\underline{\beta}^{''|'}$ of the images of $\alpha^{''|'},\beta^{''|'}$ in $\mathrm{Gl}(2,\widehat{\mathbb{Z}})^{\pm1}$, we will have

$$(28)\qquad \underline{\alpha}''=\underline{u}'(\underline{\alpha})\underline{\alpha}',\qquad \underline{\beta}''=\underline{u}'(\underline{\beta})\underline{\beta}',$$
$$\text{in addition to } \mu''=\mu\mu'\quad \text{hence}\quad \varepsilon''_2=\varepsilon_2\varepsilon'_2.$$

[scan 386]

[p. 494] and it remains to check that the element

$$g'' = (\underline{\alpha}'', \underline{\beta}'', \mu'' = \mu\mu', \varepsilon_2'' = \varepsilon_2'\varepsilon_2) \in$$
$$\Gamma(\widehat{\mathbb{Z}}; \mathrm{Gl}(2) \times \mathrm{Sl}(2) \times \mathbf{E}' \times \mu_2)$$

is indeed the product of the elements

$$g' = (\underline{\alpha}', \underline{\beta}', \mu', \varepsilon') \quad \text{and} \quad g = (\underline{\alpha}, \underline{\beta}, \mu, \varepsilon).$$

That it is OK for μ'' and ε'' is trivial, it remains to check that in $\mathcal{G}^*_{\rho,\sigma}$, the product is indeed (as regards the components in α and in β) given by formulas (28) — which will be valid, of course, over any base, and under the general conditions of V (or even[i2] of III, if we are interested in $\mathcal{G}_{\rho,\sigma}$, instead of $\mathcal{G}^*_{\rho,\sigma}$). We will have

$$(29) \qquad \begin{cases} \underline{\alpha} = \underline{u}\,\underline{a}^{-1}, & \underline{\beta} = \underline{u}\,\underline{b}^{-1} & \underline{\alpha}, \underline{\alpha}' \in T_\rho(\widehat{\mathbb{Z}}) \\ \underline{\alpha}' = \underline{u}'\,\underline{a}'^{-1}, & \underline{\beta}' = \underline{u}'\,\underline{b}'^{-1} & \underline{\beta}, \underline{\beta}' \in N'_\sigma(\widehat{\mathbb{Z}}) \end{cases}$$

and by definition of the products in $\mathcal{G}^*_{\rho,\sigma}$, the product of [d2] $g'g$ will therefore have components $\underline{\alpha}''_0$ and $\underline{\beta}''_0$

$$\underline{\alpha}''_0 = (\underline{u}'\underline{u})(\underline{a}'\underline{a})^{-1}, \qquad \underline{\beta}''_0 = (\underline{u}'\underline{u})(\underline{b}'\underline{b})^{-1}$$

and it remains to prove

$$\underline{\alpha}''_0 = \underline{\alpha}'', \qquad \underline{\beta}''_0 = \underline{\beta}'', \quad \text{i.e. the relations}$$

$$(30) \qquad \underline{u}'(\underline{\alpha})\cdot\underline{\alpha}' = (\underline{u}'\underline{u})(\underline{a}'\underline{a})^{-1} \qquad \underline{u}'(\underline{\beta})\underline{\beta}' = (\underline{u}'\underline{u})(\underline{b}'\underline{b})^{-1}$$

where $\underline{\alpha}, \underline{\beta}, \underline{\alpha}', \underline{\beta}'$ are given in terms of [d4] $\underline{u}, \underline{a}, \underline{b}, \underline{u}', \underline{a}', \underline{b}'$ by (29). We therefore have

$$\begin{aligned}\underline{u}'(\underline{\alpha})\underline{\alpha}' &= \underbrace{\underline{u}'(\underline{u}\,\underline{a}^{-1})\underline{u}'^{-1}}\,\underline{u}'\underline{a}'^{-1} \\ &= (\underline{u}'\underline{u})(\underline{a}^{-1}\underline{a}'^{-1}) = (\underline{u}'\underline{u})(\underline{a}'\underline{a})^{-1},\end{aligned}$$

[d6] and likewise for the second relation 30, which proves our assertion. ✓|/ 385

Let us note on this occasion that the systems

$$(31) \qquad (\alpha, \beta, \mu = 1, \varepsilon = 1) \quad \text{with} \quad \alpha \in \Gamma\mathbb{G}_m, \qquad \beta \in \Gamma\mathbb{G}_m$$

are in $\Gamma|S\mathcal{G}^{\circ|0}_{\rho,\sigma}$. [d3] [which are indeed stable under multiplication, [d4] $(\alpha, \beta, \mu, \varepsilon)$, of α and β each by a section of $\mathbb{G}_m$, which does not change $\tilde{\alpha}, \tilde{\beta}$ ...] they correspond, by the isomorphism $\mathcal{G}_{\rho,\sigma} \simeq B'_0 \times T_\rho \times T_\sigma$, to the systems $(\underline{u}, \underline{a}, \underline{b})$ with $\underline{u} = 1$, $\underline{a} \in \Gamma\mathbb{G}_m$, $\underline{b} \in \Gamma\mathbb{G}_m$) and form a subgroup (with ordinary multiplication [d6] [d7] in α β[i4] as group law) — if α, β are sections of μ_2, we find a subgroup [d8] "by nature|in action trivial" $\mu_2 \times \mu_2$[i5] of $S\mathcal{G}_{\rho,\sigma}$. The action by translation of this subgroup $\simeq \mathbb{G}_m \times \mathbb{G}_m$ on $\mathcal{G}^*_{\rho,\sigma}$ is given by multiplication [d9] of the[i6] [d10] components in question. This shows that the fact of working with $\underline{\alpha}, \underline{\beta}$ defined only "up to signs" simply amounts to working in the quotient groups of $\underline{\mathcal{G}^*_{\rho,\sigma}(\widehat{\mathbb{Z}})}$ (or of $S\mathcal{G}^*_{\rho,\sigma}(\widehat{\mathbb{Z}})$) by the subgroup

$$\begin{array}{|c|}\hline \Sigma_0\ . \\ \simeq \mathbb{Z}/2\mathbb{Z} \times \mathbb{Z}/2\mathbb{Z} \\ \hline \end{array}$$

[d11] of the elements $(\alpha, \beta, 1, 1)$ with $\alpha, \beta \in \{\pm 1\}$. This 386

[scan 388]

[p. 495]

makes precise at the same time the meaning of the expression: we have a homomorphism of groups ….

Let us now return to the map (23) with arbitrary f, and make precise the composition law of $S_0\mathcal{M}^{!\sim}_{0,3}$ in terms of (α,β,f) i.e. in terms of the $u_{\alpha,\beta,f}$. Let us consider the subgroup formed of the $(1,1,f)$, [d1] [d2] which corresponds to the pairs[i1] (u,f) with $u=\mathrm{int}(f^{-1})$, i.e. to the pairs $(\mathrm{int}(f^{-1}),f)$ — they form a "group isomorphic to $\widehat{\Pi}_{0,3}$, and we have a $\frac{1}{2}$ direct product structure:

$$(31)\qquad S_0\mathcal{M}^{!\sim}_{0,3}\simeq\mathcal{M}^{!\sim}_{0,3}[0]\cdot\widehat{\Pi}_{0,3}$$

where

$$(32)\qquad \begin{cases}\widehat{\Pi}_{0,3}\longrightarrow S_0\mathcal{M}^{!\sim}_{0,3}\\ f\longmapsto(\mathrm{int}(f),f)\longleftrightarrow(1,1,f^{-1}),\end{cases}$$

the operation of $\mathcal{M}^{!\sim}_{0,3}[0]$ on $\widehat{\Pi}_{0,3}$ [d4] the tautological operation (deduced from the inclusion $\mathcal{M}^{!\sim}_{0,3}[0]\subset\mathcal{M}^{!\sim}_{0,3}\subset\underline{\mathrm{Aut}}_{\mathrm{lac}}(\widehat{\Pi}_{0,3})$).

The invariant[i2] subgroup $\widehat{\mathbb{Z}}$ of $S_0\mathcal{M}^{!\sim}_{0,3}$ is given by the pairs $(u,f)=(1,\ell_0^n)$ $(n\in\widehat{\mathbb{Z}})$ which we also put in the form (α,β,f) where α,β are such that $u_{\alpha,\beta}=fu=\mathrm{int}(\ell_0^n)$, hence $\alpha=\beta=\ell_0^n$, i.e.

$$(33)\qquad \widehat{\mathbb{Z}}\longrightarrow S_0\mathcal{M}^{!\sim}_{0,3}\quad\text{is identified with}\quad n\longmapsto(\ell_0^n,\beta=\ell_0^n,f=\ell_0^n)$$

[scan 389]

We will have

$$(f'^{-1}u_{\alpha',\beta'})(f^{-1}u_{\alpha,\beta}) = \underbrace{f'^{-1}u_{\alpha',\beta'}(f^{-1})}_{f''^{-1}}(u_{\alpha',\beta'}u_{\alpha,\beta})$$

i.e. the multiplication in $S_0\mathcal{M}^{!\sim}_{0,3}$ is given, in terms of the components $(\alpha',\beta',f')(\alpha,\beta,f)$, for|by $^{d2}(\alpha'',\beta'',f'')$, where

$$(34)\qquad \begin{cases} u_{\alpha'',\beta''} = u_{\alpha',\beta'}u_{\alpha,\beta} \\ f'' = u_{\alpha',\beta'}(f)f' \end{cases} \text{ i.e. } \begin{cases} \alpha'' = u_{\alpha',\beta'}(\alpha)\alpha' \\ \beta'' = u_{\alpha',\beta'}(\beta)\beta' \end{cases}, \quad \text{and}$$

Returning now to the definition of $S\mathcal{M}_{\rho\sigma}$ (1), we are going to introduce there the corresponding multiplication, which amounts to defining $S\mathcal{M}_{\rho\sigma}$ as a $\frac{1}{2}$ direct product

$$(35)\qquad S\mathcal{M}_{\rho,\sigma} \overset{\text{dfn}}{=} S\mathcal{G}^*_{\rho,\sigma}\cdot SG \qquad (\text{product } \tfrac{1}{2} \text{ direct})$$

by the operation of $S\mathcal{G}^*_{\rho,\sigma}$ on G via the homomorphism Θ (page 489'|488'), and by defining|will define the|the ^{d3}morphism^{i2}

$$(36)\qquad \left| \begin{array}{l} S\mathcal{M}_{\rho,\sigma} \longrightarrow S\mathcal{G}^*_{\rho,\sigma} \times_S G \\ U\cdot f \longmapsto (U, f^{-1}) \end{array} \right.$$

[scan 390]

[p. 496]

We have thus done what was needed, in the case $S = \mathrm{Spec}(\widehat{\mathbb{Z}})$ etc, to have a homomorphism of groups

$$(37) \qquad S_0\mathcal{M}^{!\sim}_{0,3} \longrightarrow S\mathcal{M}_{\rho,\sigma}(\widehat{\mathbb{Z}})/\widetilde{\Sigma}$$

where $\Sigma_0 \simeq \mathbb{Z}_{/2} \times \mathbb{Z}_{/2}$ is the subgroup [d2] of $S\mathcal{G}^*_{\rho,\sigma}$ introduced on page 494', which operates trivially on G hence is invariant in $S\mathcal{M}_{\rho,\sigma}$, hence in $S\mathcal{M}_{\rho,\sigma}(\widehat{\mathbb{Z}})$, and where

$$(38) \quad \widetilde{\Sigma} = \Sigma_0 \times \underbrace{\{\pm 1\}}_{\substack{\text{this factor identified with the center of } SG(\widehat{\mathbb{Z}}) \\ =\mathrm{Sl}(2,\widehat{\mathbb{Z}}),\ \text{contained in } \mathrm{Gl}(2,\widehat{\mathbb{Z}}) \\ =G(\widehat{\mathbb{Z}})}} \simeq \mathbb{Z}/2\mathbb{Z} \times \mathbb{Z}/2\mathbb{Z} \times \mathbb{Z}/2\mathbb{Z}$$

is the corresponding normal group in the $\frac{1}{2}$ direct product — the fact of passing to the quotient by Σ expresses the three ambiguities|ambiguities of signs, on α, on β and on f.

Let us now consider the homomorphism

$$(39) \quad \left| \begin{array}{l} \mathbb{G}_a \longrightarrow S_0|S\mathcal{M}_{\rho,\sigma} \\ \\ \lambda \longmapsto (\alpha{=}\varepsilon_0(\lambda|-\lambda), \beta{=}\varepsilon_0(-\lambda), \mu = 1, \varepsilon = 1, f = \varepsilon_0(\lambda)) \end{array} \right.$$

it is a homomorphism of groups, and even makes $\mathbb{G}_a$ a normal subgroup. To verify[i1] this the most convenient thing is to identify $S_0|S\mathcal{M}^{!\sim}_{\rho,\sigma}$ with the $\frac{1}{2}$-direct product (35), 389

[scan 392]

[p. 497]

it being understood, of course, that we let $\mathcal{G}^*_{\rho,\sigma}$ operate on G by inner automorphisms via the factor B'_0. We must check that

$$i(L_0) = \{i_B(\lambda)i_G(\lambda^{-1}) \mid \lambda \in \Gamma L_0\}$$

is invariant under the[i1] $i_\rho(x)$, $i_\sigma(x)$, $i_B(x)$ and $i_G(x)$. — For the first two, this is trivial — with trivial action on L_0.

If $x \in \Gamma B'_0$, we will have

$$\begin{aligned} i_B(x)(i(\lambda)) &= i_B(x)(i_B(\lambda)i_G(\lambda^{-1})) = \\ &= \underbrace{i_B(x)(i_B(\lambda))}_{i_B(x(\lambda))} \cdot \underbrace{i_B(x)(i_G(\lambda^{-1}))}_{\substack{i_G(x)(i_G(\lambda^{-1})) \\ =i_G(x(\lambda)^{-1}]}} \\ &= i(x(\lambda)) \end{aligned}$$

m1063

Marginal note. [m1063] We see at once that $i(\lambda)$ commutes with G, hence is invariant under G !

which shows that

$$L_0 \xrightarrow{\ i\ } \mathcal{G}^*_{\rho,\sigma} \cdot G = \tilde{S}\mathcal{G}^*_{\rho,\sigma}$$

commutes with the natural action of B'_0 on both sides (on the second via π_B,

$$i_B : B'_0 \longrightarrow \tilde{S}\mathcal{M}^{\flat|*|\natural}_{\rho,\sigma}$$

). Finally

$$i_G(x)(i(\lambda)) = i_G(x) \cdot (i_B(\lambda)i_G(\lambda^{-1})) \cdot i_G(x)^{-1}$$

now by definition, $i_B(\lambda)$ and $i_G(\lambda)$ operate in the same way on G, hence $i(\lambda) = i_B(\lambda)i_G(\lambda^{-1})$ operates trivially on it, hence the last factor $i_G(x)^{-1}$ can jump over|under the factor $i(\lambda)$, we find

$$i_G(x)i_G(x)^{-1}i(\lambda) = i(\lambda)$$

O.K.

But we also have a semidirect product

$$\mathcal{M}^{\sim}_{0,3} \simeq \mathcal{M}^{!\sim}_{0,3}(0|\omega) \cdot \mathcal{G}|\mathcal{C}^{+}_{0,3} \tag{48}$$

which, combined directly with

$$\widehat{\mathcal{G}|\mathcal{C}}^{+}_{0,3} \longrightarrow \mathrm{Sl}(2,\widehat{\mathbb{Z}})'$$

gives a homomorphism

$$\mathcal{M}^{\sim}_{0,3} \longrightarrow (\mathcal{M}_{\rho,\sigma}(\widehat{\mathbb{Z}}) \simeq S\mathcal{G}^{*}_{\rho,\sigma}(\widehat{\mathbb{Z}}) \cdot \mathrm{Sl}(2,\widehat{\mathbb{Z}}))/\Sigma \tag{49}$$

which extends the homomorphism (45), defined first on its normal subgroup $\mathcal{M}^{!\sim}_{0,3}$ of index 6. 394

[scan 396]

[p. 499]

X Study of the group $\mathcal{M}_{\rho,\sigma}$ and of $\mathcal{M}_{\rho,\sigma} \to \mathrm{Gl}(2)$

By construction of the semidirect product

$$\mathcal{M}^{\sim}_{\rho,\sigma} \;=\; \mathcal{G}^{*\flat|\natural|\circ}_{\rho,\sigma}(\omega|0)\cdot G \;\simeq\; \underbrace{(T_0 \times T_\rho \times N'_\sigma)}_{\text{operating on } G \text{ via } T_0 \hookrightarrow G} \cdot G$$

$$\cup$$

(1)

$$\mathcal{M}_{\rho,\sigma} \;=\; S\mathcal{G}^{*\flat|\natural|\circ}_{\rho,\sigma}(\omega|0)\cdot SG \hookrightarrow \underbrace{(T_\rho \times N'_\sigma)}_{\text{operating on } G \text{ via } N'_\sigma \xrightarrow{\det} \mathbb{G}_m \xleftarrow[\sim]{\det} T_0 \hookrightarrow G} \cdot G$$

we have a group homomorphism

$$(2)\qquad \begin{cases} \mathcal{M}^{\sim}_{\rho,\sigma} \xrightarrow{\Theta} G \\ \Theta(i_B(x)i_\rho(y)i_\sigma|i'_\sigma(z)i_G(f)) = x.f \end{cases}$$

$$(x \in \Gamma T_0, \quad y \in \Gamma T_\rho, \quad z \in \Gamma N'_\sigma, \quad f \in \Gamma G).$$

The composite homomorphism

$$(3)\qquad \begin{array}{ccccc} S\mathcal{M}^{\sim}_{\rho,\sigma} & \longrightarrow & \mathcal{M}^{\sim}_{\rho,\sigma} & \xrightarrow{\Theta} & G \\ \wr & & & & \\ \underbrace{\mathcal{G}^{*\flat|\natural|\circ}_{\rho,\sigma}}_{B'_0\times T_\rho\times N'_\sigma} & & & & \cdot G \end{array}$$

[d3] described by

$$\Theta(i_B(x)i_\rho(y)i_\sigma(z)i_G(f|\varphi)) = x.f$$

(composite still denoted Θ)

and Θ will indeed be trivial on the

$$i(\lambda) = i_B(\lambda)i_G(\lambda^{-1}) \qquad (\lambda \in \Gamma L_0)$$

and therefore passes to the quotient as $\Theta : \mathcal{M}^{\sim}_{\rho,\sigma} \to G$. 395

Scans 397–415

[scan 397]

I am interested above all in the induced homomorphism

$$(4)\qquad \mathcal{M}_{\rho,\sigma} \xrightarrow{\Theta} G \simeq \mathrm{Gl}(2)_S$$

it is obvious|obviously an epimorphism, for its image contains trivially SG, so it suffices to see that the composite with

$$G/SG \xrightarrow[\sim]{\det} \mathbb{G}_m$$

is an epimorphism, i.e. that the composite with det is one, now this composite is also the homomorphism (again denoted χ)

$$(5)\qquad \begin{array}{ccccc} \mathcal{M}_{\rho,\sigma} & \xrightarrow{\text{canonical projection}} & S\mathcal{G}^{*\flat|\sharp}_{\rho,\sigma}(0) & \xrightarrow{\text{multiplier}} & \mathbb{G}_m \\ \wr\downarrow & & & & \\ S\mathcal{G}^{*\flat|\sharp}_{\rho,\sigma}(0)\,.\,SG & & (\alpha,\beta,\mu,\varepsilon) & \longmapsto & \mu \end{array}$$

which is an epimorphism — in terms of

$$(6)\qquad S\mathcal{G}^{*\flat|\sharp}_{\rho,\sigma}(0) \hookrightarrow T_0 \times T_\rho \times N'_\sigma$$

this will be

$$(\underline{u},\underline{a},\underline{b}) \longmapsto \det \underline{u}\ ,$$

in terms of

$$(7)\qquad S\mathcal{G}^{*\flat|\sharp}_{\rho,\sigma}(0) \hookrightarrow T_\rho \times N'_\sigma$$

this will be

$$(\underline{a},\underline{b}) \longrightarrow \det \underline{b}$$

(cf. VIII, page 489 in particular (25)).

Let us define

$$(8)\qquad \mathcal{M}^+_{\rho,\sigma} \overset{\text{definition}}{=} \operatorname{Ker}\left(\ \mathcal{M}_{\rho,\sigma} \xrightarrow{\chi} \mathbb{G}_m\ \right),$$

we shall thus have a homomorphism of exact sequences 396

$$(9)\qquad \begin{array}{ccccccccc} 1 & \longrightarrow & \mathcal{M}^+_{\rho,\sigma} & \longrightarrow & \mathcal{M}_{\rho,\sigma} & \longrightarrow & \mathbb{G}_m & \longrightarrow & 1 \\ & & \downarrow & & \downarrow\Theta & & \downarrow & & \\ 1 & \longrightarrow & SG & \hookrightarrow & G & \xrightarrow{\det} & \mathbb{G}_m & \longrightarrow & 1 \end{array}$$

which we shall compare with §39 page 299 (1)

As $\mathcal{M}_{\rho,\sigma}$ is flat of relative dimension 6, and G idem|idem of relative dimension 4, the kernel of the epimorphism $\Theta\colon \mathcal{M}_{\rho,\sigma} \longrightarrow G$ is necessarily flat of relative dimension 2. Let us denote it by $I_{\rho,\sigma}$, it is contained in the kernel $J_{\rho,\sigma}$ (of relative dimension 3) of the composite

$$\mathcal{M}_{\rho,\sigma} \longrightarrow G \longrightarrow PG\ ,$$

so that we have

$$(10)\qquad 1 \longrightarrow I_{\rho,\sigma} \longrightarrow J_{\rho,\sigma} \longrightarrow \mathbb{G}_m \longrightarrow 1 \longrightarrow 1$$

and a composition series of $\mathcal{M}_{\rho,\sigma}$

$$(11)\qquad \begin{array}{ccccccc} 1 & \subset & I_{\rho,\sigma} & \subset & J_{\rho,\sigma} & \subset & \mathcal{M}_{\rho,\sigma} \\ & & \llcorner\!\!\!

It seems more natural to me to do the dévissage of $\mathcal{M}_{\rho,\sigma}$ starting by going down to the identity component $\mathcal{M}^{\circ}_{\rho,\sigma}$, 398

[scan 400]

[p. 501] the group

$$\text{(15)} \qquad \mathcal{M}_{\rho,\sigma}/\mathcal{M}^{\circ}_{\rho,\sigma} \overset{\text{component of the identity}}{\simeq} \mathcal{G}^{*}_{\rho,\sigma}(0)/\mathcal{G}^{*}_{\rho,\sigma}(0)^{\circ} \simeq \mu_2 \times \mu_2$$

(cf. page 489 (23)), we shall thus have

$$\begin{aligned} \mathcal{M}^{\circ}_{\rho,\sigma} = \mathcal{G}^{*}_{\rho,\sigma}(0)^{\circ} \,.\, SG &\longrightarrow (T_0 \times T_\rho \times T_\sigma) \,.\, SG \\ &\wr \\ &T_\rho \times T_\sigma \times (\underbrace{T_0 \,.\, SG}_{\simeq G}) \\ &\wr \\ &T_\rho \times T_{\sigma|\rho} \times G \end{aligned}$$

$$\text{(16)} \qquad \begin{aligned} \mathcal{M}^{\circ}_{\rho,\sigma} &\hookrightarrow T_\rho \times T_\sigma \times G \\ &\simeq \left\{ \begin{pmatrix} x & , & y & , & f \\ \cup & & \cup & & \cup \\ \Gamma T_\rho & & \Gamma T_\sigma & & \Gamma G \end{pmatrix} \;\middle|\; \det x = \det y = \det f \right\} \end{aligned}$$

Thus the kernel

$$\text{(17)} \qquad \left\{ \begin{aligned} J^{\circ}_{\rho,\sigma} &\overset{\text{definition}}{=} \operatorname{Ker} \begin{pmatrix} \mathcal{M}^{\circ}_{\rho,\sigma} & \longrightarrow & PG \\ & & \wr \\ & & G/\mathbb{G}_m \end{pmatrix} \\ &\simeq \left\{ \begin{pmatrix} x & , & y & , & \lambda \\ \cup & & \cup & & \cup \\ \Gamma T_\rho & & \Gamma T_\sigma & & \Gamma \mathbb{G}_m \end{pmatrix} \;\middle|\; \det x = \det y = \lambda^2 \right\} \\ &\simeq T_\rho \times_{\mathbb{G}_m} T_\sigma = \{(x,y) \mid \det x = \det y\} \\ &\simeq S\mathcal{G}^{*}_{\rho,\sigma}(0)^{\circ} \end{aligned} \right.$$

Finally, we deduce from this that

$$\text{(18)} \qquad \begin{aligned} I^{\circ}_{\rho,\sigma} &\overset{\text{definition}}{=} \operatorname{Ker} \begin{pmatrix} \mathcal{M}^{\circ}_{\rho,\sigma} & \longrightarrow & G \end{pmatrix} \\ &\simeq ST_\rho \times ST_\sigma = \left\{ \begin{pmatrix} x & , & y \\ \cup & & \cup \\ \Gamma T_\rho & & \Gamma T_\sigma \end{pmatrix} \;\middle|\; \det x = \det y = 1 \right\}. \end{aligned}$$

Let us recapitulate: 399

thanks to the canonical inclusions

$$\mu_2 \hookrightarrow ST_\rho, \qquad \mu_2 \hookrightarrow ST_\sigma, \qquad \mu_2 \hookrightarrow SG \tag{26}$$

giving rise to canonical homomorphisms already considered elsewhere

$$\Sigma = (\mathbb{Z}/2\mathbb{Z})^3 \longrightarrow \Gamma\mathcal{M}^{\circ+}_{\rho,\sigma} \subset \Gamma\mathcal{M}^{+|*}_{\rho,\sigma}. \tag{27}$$

I am going to introduce for the group $\mathcal{M}_{\rho,\sigma}$ notations which paraphrase the notations $\mathcal{M}_{0,3}$ etc., in the context of group schemes. The invariant subgroup SG of $\mathcal{M}_{\rho,\sigma}$ will also be denoted $\widetilde{G}^+_{\rho,\sigma}$ (the analogue of $\widetilde{\widetilde{G}}^+_{0,3}$), the quotient

$$\mathcal{M}_{\rho,\sigma}/\widetilde{G}^+_{\rho,\sigma} \simeq \tau^!_{\rho,\sigma} \tag{28}$$

paraphrases $\tau^!_{0,3}$, we have moreover

$$\tau^!_{\rho,\sigma} \simeq S\mathcal{G}^*_{\rho,\sigma}(0) \hookrightarrow T_0 \times T_\rho \times N'_\sigma \tag{29}$$

m1077

Marginal note. m1077 Seen hanging around a bit the sign !, (which has fallen from the sky — even in the section following the X) it is $\Gamma_{\rho,\sigma}$ (and not $\tau_{\rho,\sigma}$ without the exponent !) that one ought to denote this group by !

— in what follows the simpler and more suggestive notation $\tau_{\rho,\sigma}$ will be used in preference to $S\mathcal{G}^*_{\rho,\sigma}(0)$. We thus have

$$\begin{array}{ccccccccc} 1 & \longrightarrow & \widetilde{G}^+_{\rho,\sigma} & \longrightarrow & \mathcal{M}_{\rho,\sigma} & \to & \tau^!_{\rho,\sigma} & \to & 1 \\ & & \wr\vert & & & & & & \\ & & SG \simeq \mathrm{Sl}(2)_S & & & & & & \end{array} \tag{30}$$

and a canonical splitting as a semidirect product

$$\mathcal{M}_{\rho,\sigma} \simeq \mathcal{M}_{\rho,\sigma}(0) \,.\, \widetilde{G}^+_{\rho,\sigma} \tag{31}$$

where

$$\begin{array}{ccc} \mathcal{M}_{\rho,\sigma}(0) & \hookrightarrow & \mathcal{M}_{\rho,\sigma} \\ & \searrow^{\sim} & \downarrow \mathrm{can} \\ & & \tau^!_{\rho,\sigma} \end{array} \tag{32}$$

is a subgroup isomorphic to $\tau^!_{\rho,\sigma}$ — which corresponds to the subgroup $\mathcal{M}^{!\sim}_{0,3}(0)$ in $\mathcal{M}^{\sim}_{0,3}$ (§46, V).

Remark. One would like to introduce a $\tau_{\rho,\sigma}$ extension (or product)i1 of $\tau^!_{\rho,\sigma}$ by a group such as $\widetilde{G}_3$ (which would be denoted $\tau^+_{\rho,\sigma}$), in relation to a subgroup $\pi_{\rho,\sigma}$ of $\widetilde{G}^+_{\rho,\sigma}$ d1 such that $\widetilde{G}^+_{\rho,\sigma}/\pi_{\rho,\sigma} \simeq \widetilde{G}_3$ — but this is not possible in the context of group schemes (even in the modular special case), since $\widetilde{G}^+_{\rho,\sigma} \simeq \mathrm{Sl}(2)_S$ is d2 relatively connected over S. On the other hand one can, in the "modular case" $\rho = \begin{pmatrix} 0 & 1 \\ -1 & 1 \end{pmatrix}$, $\sigma = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix}$ introduce a canonical section

$$\dot{\tau}|\dot{t} = \dot{\tau}_\infty|\dot{t}_\infty \in \Gamma(\tau^!_{\rho,\sigma}) \tag{33}$$

whose representative τ_∞ in $\Gamma\mathcal{M}^!_{\rho,\sigma}(0)$ is explicitly given as

$$\tau_\infty = \begin{pmatrix} -1 & 0 \\ 0 & +1 \end{pmatrix}. \tag{34}$$

(It would be interesting to see whether, outside the 402

[p. 503]

modular case, one can introduce "anti-involutions" which generalize the geometric reflections

$$\begin{cases} r_0 = \tau'_\infty = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \\ r_1 = -\tau'_0 = \begin{pmatrix} -1 & 1 \\ 0 & 1 \end{pmatrix} \\ r_\infty = \tau_\infty = \begin{pmatrix} -1 & 0 \\ 0 & +1 \end{pmatrix} \end{cases} \qquad \text{(cf. p. 335′, §42, IV)} \qquad (35)$$

I am convinced that one can. Besides, had we not brought to light in $\mathcal{M}_{\rho,\sigma}$ a subgroup $\mu_2 \times \mu_2 \times \mu_2$, d2 giving[i1] the three remarkable sections (corresponding respective[ly] to the d3 sections -1 of the three factors μ_2)? But I am getting things mixed up here — these sections were sections of $\mathcal{M}^\circ_{\rho,\sigma}$ — whereas the sections d4 $\tau_\infty, \tau'_\infty, \tau'_0$[i2] are of[i3] multiplier d5 $Z_{\rho,\sigma} \overset{\text{df}}{=} (\operatorname{Centr} \mathcal{M}^\circ_{\rho,\sigma})$.[i4] -1, thus correspond to $\varepsilon = \varepsilon' = -1$, thus correspond to the "least trivial" section $(-1,-1)$[i5] of $\mathcal{M}_{\rho,\sigma}/\mathcal{M}^\circ_{\rho,\sigma} = \mu_2 \times \mu_2$.

[scan 405]
d1 d2

$\hookrightarrow$

Let us do the calculations to determine the invariants $\alpha\ \beta$ ... corresponding to r_0, r_1, r_∞.

i) $r_\infty = \tau_\infty = \begin{pmatrix} -1 & 0 \\ 0 & 1 \end{pmatrix} \in \mathrm{Gl}(2,\mathbb{Z}) \subset \mathrm{Gl}(2,\widehat{\mathbb{Z}})^{\pm 1}$

We even have: $\tau_\infty \in T_0'|B_0'(\mathbb{Z})$, d5 it is the only element[i1] d6 that is nontrivial in $T_0'(\mathbb{Z}) \simeq \mathbb{G}_m(\mathbb{Z}) \simeq \{\pm 1\}$. d7

The inner automorphism it defines in $\Pi_{0,3}$ or in $\mathrm{Sl}(2,\mathbb{Z})$ — or their profinite completions — stabilizes the subgroup $\widetilde{L}_0$ generated by ε_0 (i.e. L_0 generated by $\varepsilon_0^2 = \ell_0$)[i2]

$$\tau_\infty(\varepsilon_0) = \varepsilon_0^{-1}, \qquad \tau_\infty(\ell_0) = \ell_0^{-1}$$

(∗)

thus

$$\tau_\infty \in \mathcal{M}_{0,3}^{!\sim}[0]$$

d8 d9 it is of the form $u_{\alpha,\beta}$, d10 the calculations already done give

$$\alpha = \tau_\infty, \qquad \zeta|\xi = g = \alpha\rho(\alpha)^{-1} = -\ell_1^{-1} = -\begin{pmatrix} 1 & 0 \\ -2 & 1 \end{pmatrix}$$

(watch the sign − when doing the calculations in $\mathrm{Sl}(2,\mathbb{Z})$ and not in $\mathrm{Sl}(2,\mathbb{Z})'$!)

$$\beta = \underline{1}, \qquad \eta = h = 1,$$
$$\mu = -1, \qquad \varepsilon = \varepsilon_2(\mu) = -1, \qquad \varepsilon' = \varepsilon_3(\mu)|\varepsilon_3^b(\mu) = -1.$$

we have here $B = 0, D = -1$, thus

$$u = \begin{pmatrix} \frac{1}{D} = \mu & \frac{B}{D} = \mu D | \mu B \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} -1 & 0 \\ 0 & 1 \end{pmatrix} = \tau_\infty$$

$$\underline{a} = \alpha^{-1} u = \tau_\infty^{-1} \tau_\infty = \underline{1}, \qquad \underline{b} = \beta^{-1} u = \tau_\infty.$$

thus

$$r_\infty = \tau_\infty = (\underline{u}_\infty = \tau_\infty, \underline{a}_\infty = 1, \underline{b}_\infty = \tau_\infty) \in T_0 \times T_\rho \times N'_\sigma. \tag{36}$$

the nontrivial element of ${}_2T_0(\mathbb{Z}) \simeq {}_2T'_0(\mathbb{Z})$[i4]

N.B. Let more generally

$$\underline{u} = \begin{pmatrix} \mu & \lambda \\ 0 & 1 \end{pmatrix} \in B'_0(\widehat{\mathbb{Z}}) \subset \mathrm{Gl}(2, \mathbb{Z})$$

and let us consider the [d14] automorphism of $\mathrm{Sl}(2, \mathbb{Z})' \simeq$ which it induces, hence an automorphism $(\in \mathcal{M}^{!\sim}_{0,3})$[i5] of $\widetilde{\widetilde{G}}^{+}_{0,3}$, what are these invariants α, β etc.? We shall be able obvious- 404

[scan 406]

[p. 504] ly take $f = 1$, and we will have

$$\alpha = \underline{u}, \qquad \text{whence} \qquad \underline{a} = 1,$$

on the other hand, let us note that $\mu \in \{\pm 1\}$i.e. $\mu = (-1)^k$ $(k \in \mathbb{Z}/2\mathbb{Z})$, we will have $\varepsilon = \varepsilon' = \mu$, and if $\mu = 1$ (i.e. $u \in \mathrm{Sl}(2,\mathbb{Z})$)[i2] we will have $\beta = \underline{u}$ ([d1] hence $\underline{b} = 1$, otherwise $\beta = u\tau_\infty$ hence $\underline{b} = \tau_\infty$), in all cases we will have

$$\beta = u\tau_\infty^k, \qquad \underline{b} = \tau_\infty^k,$$

in summary

$$\underline{u} = \left(\begin{matrix} \underline{u} = u, \underline{a} = 1, \underline{b} = \tau_\infty^k \\ \cup \quad\quad \cup \quad\quad \cup \\ \Gamma B'_0 \quad \Gamma T_\rho \quad \Gamma N'_\sigma \end{matrix} \right) \in \underset{\mathcal{M}_{\rho,\sigma}[0](\widehat{\mathbb{Z}})}{S\mathcal{G}|\mathcal{G}^*_{\rho,\sigma}(0)(\widehat{\mathbb{Z}})} \subset \left(B'_0 \times T_\rho \times N'_\sigma\right)(\widehat{\mathbb{Z}}). \tag{37}$$

[d4]

But this is not an element in [d5] normalized form — [d6] i.e.[i4] it is not in $\Gamma\mathcal{G}^*_{\rho,\sigma}(0)$, unless $\lambda = 0$. [d7]

2°) $r_1 = -\tau'_0 = \begin{pmatrix} -1 & 1 \\ 0 & 1 \end{pmatrix}$, this is precisely a case that falls under the preceding remarks, we will have

$$r_1|\tau_1 = -\tau'_0 = \left(\underline{u}_1 = -\tau'_0 = \begin{pmatrix} -1 & 1 \\ 0 & 1 \end{pmatrix}, \ \underline{a} = 1, \ \underline{b} = \tau_\infty \right) \in \mathcal{M}_{\rho,\sigma}[0](\mathbb{Z}) \tag{38}$$

[m1082]

Marginal note. [m1082] N.B. reducing modulo $L_0 \subset \widetilde{G}^+_{\rho,\sigma}$, τ_∞ and r_1 have the same image in $\tau_{\rho,\sigma}$, namely $(-1, 1, \tau_\infty)$.

3°) $r_0 = \tau'_\infty = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}$, this time we have an automorphism of $\widetilde{G}^+_{0,3}$ or $\widetilde{G}^{+\wedge}_{0,3}$ [i5] which does not normalize L_0 — that is better, if we want r_0, r_1, r_∞ to generate $\mathrm{Gl}(2,\mathbb{Z})$ (or even "only" $\mathrm{Gl}(2,\mathbb{Z})'$) !

We have $\tau'_\infty = \tau_\infty \sigma_\infty$, so its image in $\mathcal{M}_{\rho,\sigma}(\mathbb{Z}) \subset \mathcal{M}_{\rho,\sigma}(\widehat{\mathbb{Z}})$ is [d8] the product of the images of τ_∞ and σ_∞ — the first was computed in 1°, the second is tautological since $SG \simeq \widetilde{G}^+_{\rho,\sigma}$ and $\sigma_\infty \in SG(\mathbb{Z})$. We will note that [d9] $r_0 = \tau'_\infty$ thus has the same image 405

[p. 504]

in $\tau_{\rho,\sigma}(\mathbb{Z})$ as $r_\infty = \tau_\infty$ and $r_1 = -\tau_0'$, it is always the same element [d1]

$$(39) \qquad (-1, 1, \tau_\infty) \in \left(\underset{\wr \mathbb{G}_m}{T_0} \times T_\rho \times N'_\sigma \right)(\mathbb{Z})$$

Let us moreover compute

$$T_0 \times T_\rho \times N'_\sigma(\mathbb{Z}) = T_0(\mathbb{Z}) \times T_\rho(\mathbb{Z}) \times N'_\sigma(\mathbb{Z})$$

We have

$$(40) \quad \begin{cases} T_0 \simeq \mathbb{G}_m, \quad T_0(\mathbb{Z}) \simeq \{\pm 1\} & \\ T_\rho(\mathbb{Z}) \simeq (\mathbb{Z} + \mathbb{Z}.\rho)^* \simeq \mathbb{Z}/6\mathbb{Z} & \text{group generated by } \rho \\ N'_\sigma(\mathbb{Z}) \simeq \{1, \tau_\infty\}.T_\sigma(\mathbb{Z}) & \text{(semidirect product)} \\ T_\sigma(\mathbb{Z}) \simeq (\mathbb{Z} + \mathbb{Z}\sigma)^* \simeq \mathbb{Z}/4\mathbb{Z} & \text{group generated by } \sigma \\ N'_\sigma(\mathbb{Z}) \simeq D_4 & \text{dihedral group of order 4 (“symmetries of the square”)} \end{cases}$$

whence

$$(41) \quad (T_0 \times T_\rho \times N'_\sigma)(\mathbb{Z}) \simeq \underbrace{(\mathbb{Z}/2\mathbb{Z})}_{\substack{\text{group generated} \\ \text{by } \tau_\infty}} .(\mathbb{Z}/2\mathbb{Z} \times \mathbb{Z}/6\mathbb{Z} \times \mathbb{Z}/4\mathbb{Z})$$

τ_∞ operates trivially on the first two factors and by symmetry on the last

$$\simeq \underbrace{\mathbb{Z}/2\mathbb{Z} \times \mathbb{Z}/6\mathbb{Z} \times \underbrace{(\mathbb{Z}/2\mathbb{Z}.\mathbb{Z}/4\mathbb{Z})}_{D_4}}_{\downarrow}$$

On the other hand [m1084]

Marginal note. [m1084] N.B. the condition $\det \underline{a} = \varepsilon' \det \underline{u}$, $\varepsilon'^2 = 1$ is automatic, since $\mathbb{G}_m(\mathbb{Z}) = \{\pm 1\}$.

$$(42) \quad S\mathcal{G}^*_{\rho,\sigma}(0)(\mathbb{Z}) = \tau_{\rho,\sigma}(\mathbb{Z}) = \left\{ \underbrace{(u, a, b)}_{\in T_0 \times T_\rho \times N'_\sigma(\mathbb{Z})} \mid \det u = \det b \right\}$$
$$\simeq (T_\rho \times N'_\sigma)(\mathbb{Z}) \simeq \mathbb{Z}/6\mathbb{Z} \times D_4$$

[scan 408]

[p. 505]

the remarkable element, common image of $r_0 = \tau'_\infty$, $r_1 = -\tau'_0$, $r_\infty = \tau_\infty$ corresponds to the element $(1, \tau_\infty)$ of $\mathbb{Z}/6\mathbb{Z} \times (D_4 \simeq \{1, \tau_\infty\}.\mathbb{Z}/4\mathbb{Z})$.

This also gives us an expression for [d1]

(43)
$$\left\{ \begin{array}{l} \mathcal{M}_{\rho,\sigma}(\mathbb{Z}) \simeq \underbrace{\tau_{\rho,\sigma}(\mathbb{Z})}_{\mathcal{M}_{\rho,\sigma}(0)(\mathbb{Z})} . \mathrm{Sl}(2,\mathbb{Z}) \\ \qquad\qquad \text{(semidirect product)} \\ \qquad\qquad \simeq (\mathbb{Z}/4\mathbb{Z} \times D_4).\mathrm{Sl}(2,\mathbb{Z}) \end{array} \right.$$

where $\mathbb{Z}/4\mathbb{Z} \times D_4$ operates on $\mathrm{Sl}(2,\mathbb{Z})$ via the composite canonical homomorphism
(44)

$$\mathbb{Z}/4\mathbb{Z} \times D_4 \xrightarrow[\text{projection}]{\text{canonical}} D_4 \xrightarrow[\text{canonical}]{\text{homomorphism}} \{1, \tau_\infty\}$$

τ_∞ operating on $\mathrm{Sl}(2,\mathbb{Z})$ by inner automorphism with the matrix

$$\tau_\infty = \begin{pmatrix} -1 & 0 \\ 0 & 1 \end{pmatrix}.$$

!

We note that the canonical epimorphism

$$\mathcal{M}_{\rho,\sigma} \longrightarrow \mu_2 \times \mu_2$$

†[d2] through homomorphism $\tau_{\rho,\sigma}$, and induces homomorphisms on the integral points
(45)

$$\mathcal{M}_{\rho,\sigma}(\mathbb{Z}) \to \tau_{\rho,\sigma}(\mathbb{Z}) \simeq \mathbb{Z}/6\mathbb{Z} \times D_4 \to \begin{array}{c} (\mu_2 \times \mu_2)(\mathbb{Z}) \\ \simeq \{\pm 1\} \times \{\pm 1\} \end{array}$$

This homomorphism is zero on $\mathbb{Z}/6\mathbb{Z} \times \underbrace{\mathbb{Z}/4\mathbb{Z}}_{D_4^+}$ [d4] (corresponds to determinants equal to 1), and on τ_∞ takes the value $(-1,-1)$. We will note therefore that this homomorphism on the integral points is 407

not surjective.

Center of $\mathcal{M}_{\rho,\sigma}$= $\mathcal{M}_{\rho,\sigma}(0).SG$. It is the [d1]direct product of the the subgroup of the center of $\mathcal{M}_{\rho,\sigma}(0)$ which operates trivially on SG, by the subgroup of the points [d2]invariant[i2] under $\mathcal{M}_{\rho,\sigma}$[i1] center of SG. The latter center[i3] is well known, it is μ_2, [d3] and $\mathcal{M}_{\rho,\sigma}$ operates on it trivially.[i4]
m1088

Marginal note. [m1088] false, an element $g.f$ of a 1/2 direct product can be central without g operating trivially on the invariant group G.

On the other hand the subgroup of

$$\mathcal{M}_{\rho,\sigma}(0) \simeq \tau_{\rho,\sigma} \subset B'_0 \times T_\rho \times N'_\sigma$$

which operates trivially on SG, is the intersection of $\tau_{\rho,\sigma}$ with[i5] $(1 \times T_\rho \times N'_\sigma)$, for B'_0 operates trivially [d5] (since

$$B'_0 \cap \underbrace{\mu_2}_{\substack{\text{center of} \\ SG}} = \{1\} \tag{46}$$

. It is therefore the subgroup of the

$$\left\{ \left(1, \underset{\in \Gamma T_\rho}{\underline{a}}, \underset{\in \Gamma N'_\sigma}{\underline{b}} \right) \mid (\det \underline{a})^2 = 1,\ \det \underline{b} = 1 \right\} \tag{47}$$

Remains : determine the center of $\tau_{\rho,\sigma}$, extension of $\mu_2 \times \mu_2$ by $\tau^0_{\rho,\sigma} \simeq \mathcal{G}^*_{\rho,\sigma}(0)^0 \subset T^0_0 \times T_\rho \times T_\sigma$. no!
Since $\tau^0_{\rho,\sigma}$ is commutative, it suffices to determine the action of $\mu_2 \times \mu_2$ on $\tau^0_{\rho,\sigma}$, and to determine its subgroup of invariants. [m1090]

Marginal note. m1090 This will give at least the intersection of the center with $\tau^0_{\rho,\sigma}$.

[scan 410]

[p. 506]

Let us note that we have

$$\tau_{\rho,\sigma} = S\mathcal{G}^*_{\rho,\sigma}(0) \subset \mathcal{G}^*_{\rho,\sigma}(0) \simeq T_0 \times T_\rho \times N'_\sigma$$

and we have a homomorphism of exact sequences
(48)

,

which shows that the action of $\mu_2\times\mu_2$ on [d2] $\tau^0_{\rho,\sigma}$ takes place through the projection of $\mu_2\times\mu_2$ onto its first factor, and this by the operation of the latter on $T_0\times T_\rho\times T_\sigma$ which operates trivially on $T_0\times T_\rho$, and which on T_σ is the canonical operation of μ_2 on T_σ, $\sigma\mapsto\varepsilon\sigma$, whose invariants are reduced to the scalars $\mathbb{G}_m$. [d3] This reasoning[i2] shows, more generally, that the trace of the center of $\tau_{\rho,\sigma}$[i3] on the subgroup $\tau'_{\rho,\sigma}\subset\tau_{\rho,\sigma}$ kernel of

$$\tau_{\rho,\sigma}\longrightarrow\mu_2\times\mu_2\xrightarrow{1^{\text{st}}\text{ projection}}\mu_2$$

$$(\underline{u},\underline{a},\underline{b})\longmapsto\varepsilon(\underline{b})$$

is also the trace, on this subgroup, of $T_0\times T_\rho\times\mathbb{G}_m$. Moreover, since μ_2 operates faithfully on T_σ via $\sigma\mapsto\varepsilon\sigma$, we see [d4] at once that it also operates faithfully on $\tau'_{\rho,\sigma}$ (which indeed maps epimorphically onto T_σ !) so we have

$$\underline{\text{Centre}}(\tau_{\rho,\sigma})\subset\tau'_{\rho,\sigma}=\text{Ker}(\tau_{\rho,\sigma}\xrightarrow{(\underline{u},\underline{a},\underline{b})\mapsto\varepsilon(\underline{b})}\mu_2)$$

140-3-s410-D004 *deletion. Manuscript:* that

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 411]

Thus in summary

$$(49)\quad \begin{cases} \underline{\text{Centre}}(\mathcal{G}^*_{\rho,\sigma}(0)) = T_0 \times T_\rho \times \mathbb{G}_m \\ \underline{\text{Centre}} \left(\underset{S\mathcal{G}^*_{\rho,\sigma}(0)}{\underline{\tau_{\rho,\sigma}}} \right) = (T_0 \times T_\rho \times \mathbb{G}_m) \cap \tau_{\rho,\sigma} \\ \qquad\qquad = \left\{ \left(\underset{\simeq \Gamma \mathbb{G}_m}{\underset{\in \Gamma T_0}{\underline{u}}} , \underset{\in \Gamma T_\rho}{\underline{a}} , \underset{\in \Gamma \mathbb{G}_m}{\lambda} \right) \mid u = \lambda^2,\ \det \underline{a} = \varepsilon' \lambda^2,\ \varepsilon'^2 = 1 \right\} \end{cases}$$

The subgroup of the center which operates trivially on SG is thus, by (47), given by the additional restriction $u = 1$, it thus identifies with [d3]

$$(50)\quad \begin{cases} 1 \times ST'_\rho \times \mu_2 \subset \tau^{a|0}_{\rho,\sigma} \subset T_0 \times T_\rho \times N'_\sigma \\ \text{where } ST'_\rho \subset T_\rho \\ \qquad\qquad \| \ \{\underline{a} \mid (\det \underline{a}]^2 = 1\} \end{cases}$$

Thus

(51)

The group of integral points of this [d5]group[i2], in the modular case, is reduced:

false the center is larger,

$$(52)\quad \begin{cases} \mathbb{Z}/6\mathbb{Z} \times \mathbb{Z}/2\mathbb{Z} \times \mathbb{Z}/2\mathbb{Z} \\ \simeq \mathbb{Z}/3\mathbb{Z} \times (\mathbb{Z}/2\mathbb{Z} \times \mathbb{Z}/2\mathbb{Z} \times \mathbb{Z}/2\mathbb{Z}), \end{cases}$$

d6 m1094

Marginal note. [m1094] N.B. This group is in fact contained in $\mathcal{M}^0_{\rho,\sigma}(\mathbb{Z})$.

product of a cyclic group of order 3 (naturally generated by $-\rho$) with a group $(\mathbb{Z}/2\mathbb{Z})^3$, which is none other than the group Σ already in (IX).

More interesting would probably be the 410

[p. 508]

Preliminaries

$\overline{\text{XI}}$ Recapitulation on the group $\mathcal{M}_{\rho,\sigma}$.

① Given, over a scheme S, a form G of $\mathrm{Gl}(2)$, hence forms SG, PG of $\mathrm{Sl}(2)$, GP(1)|PGl(1), and two sections $\tilde{\rho}, \tilde{\sigma}$ of PG, and a 1-parameter [d1] additive bordered|based subgroup

$$\underline{\tilde{\varepsilon}}_0 : G_a \hookrightarrow PG$$

$\varepsilon_0|G_a$ [i1] (which amounts to the same thing, a [d2] regular unipotent section of ε_0 of G, or a regular nilpotent section N_0 in the form $\mathcal{M}$ of $\mathrm{M}_2(\mathcal{O}_S)$ associated to G) — satisfying the conditions

$$(1)\quad \tilde{\sigma}^{-1}\tilde{\rho} = \underline{\tilde{\varepsilon}}_0(1), \qquad \underline{\tilde{\varepsilon}}_0 \text{ and } \underline{\tilde{\varepsilon}}_1 = \rho(\underline{\tilde{\varepsilon}}_0)(= \sigma(\underline{\tilde{\varepsilon}}_0)) \text{ are independent on each fiber}$$

$$(2)\quad \mathrm{Tr}\,\sigma = 0 \qquad \text{if } \sigma \text{ is a local lifting of } \tilde{\sigma},$$

We define canonical liftings ρ, σ of $\tilde{\rho}, \tilde{\sigma}$ to G, [d3] by the conditions

$$(3)\quad \begin{cases} \varepsilon_0 = -\sigma^{-1}\rho & \text{i.e. } \varepsilon_1 = -\rho\sigma^{-1} \\ \mathrm{Tr}(\rho+\sigma) = 1 & \text{i.e. } \mathrm{Tr}\,\rho = 1, \end{cases}$$

and the constructions which follow make sense.

We construct a pinning

$$(5)\quad \mathrm{Gl}(2) \xrightarrow{\sim} G$$

by the condition that ε_1 take the form

$$(6)\quad \varepsilon_1 = \begin{pmatrix} 1 & 0 \\ 1 & 1 \end{pmatrix}$$

whence

$$(7)\quad \begin{cases} \rho = \begin{pmatrix} 0 & 1 \\ v|\upsilon & 1 \end{pmatrix}, \qquad \sigma = \begin{pmatrix} 0 & -1 \\ -v|\upsilon & 0 \end{pmatrix} \qquad (v|\upsilon \in \Gamma G_m \\ \det\rho = \det\sigma = -v|\upsilon \end{cases}$$

$$(8)\quad \varepsilon_0 = \begin{pmatrix} 1 & 1/v|\upsilon \\ 0 & 1 \end{pmatrix},$$

[p. 509]
m1104

Marginal note. m1104 $\mathcal{M}_{\rho,\sigma}[0],\ \mathcal{M}_{\rho,\sigma}(0)$, $\tau_{\rho,\sigma}|\mathcal{G}_{\rho,\sigma},\ \tau^{\circ}_{\rho,\sigma}$, $\mathcal{M}_{\rho,\sigma},\ \widetilde{\mathcal{G}}^{+}_{\rho,\sigma}$ $\tau^{\circ+}_{\rho,\sigma}$

② We introduce

$$(16)\quad \mathcal{M}_{\rho,\sigma}[0] \subset \mathcal{B}^{*}_{\rho,\sigma}|\mathcal{G}^{*}_{\rho,\sigma} = B'_0 \times T_\rho \times N'_\sigma \overset{\text{dfn}}{=} \{(\underline{u},\underline{a},\underline{b}) \mid \det \underline{u} = \det \underline{b} = \varepsilon' \det \underline{a},\ \varepsilon'^2 = 1\}$$

$$(17)\quad \mathcal{M}_{\rho,\sigma}(0) \subset \mathcal{M}_{\rho,\sigma}[0] \quad \text{defined by } \underline{u} = 1 \quad \text{i.e.}$$
$$\mathcal{M}_{\rho,\sigma}(0) = \mathcal{M}_{\rho,\sigma}[0] \cap (T_0 \times T_\rho \times N'_\sigma) \quad \text{in } \mathcal{G}^{*}_{\rho,\sigma}.$$

$$(18)\quad L_0 \hookrightarrow \mathcal{M}_{\rho,\sigma}[0]$$
$$\lambda \longmapsto (\lambda, 1, 1)$$

thus we have

$$(19)\quad \mathcal{M}_{\rho,\sigma}[0] \simeq \mathcal{M}_{\rho,\sigma}[0)|(0)\,.\,L_0 \quad \text{product } \tfrac{1}{2}\text{-direct}$$

We have a homomorphism

$$(20)\quad \dot{\mathcal{M}}|\mathcal{M}_{\rho,\sigma}[0] \longrightarrow G_m \times \mu_2 \times \mu_2$$

denoted $\{g \mapsto \chi(g), \varepsilon_2(g), \varepsilon_3(g)$

for $g = (\underline{u},\underline{a},\underline{b})$ we have

$$\chi(g) = \det \underline{u} = \det \underline{b}$$
$$\varepsilon_2(g) = \varepsilon_\sigma(b) \quad \text{(cf. (13)(14)}$$
$$\varepsilon_3(g) = \det(\underline{a})/\det \underline{b}$$
$$\text{i.e.} \begin{cases} \det a = \varepsilon_3 \mu \\ \text{where } \mu = \chi(g) \end{cases}$$

trivial on L_0 (thus factoring through the quotient). We also set

$$(21)\quad \tau_{\rho,\sigma} \simeq \mathcal{M}_{\rho,\sigma}[0]/L_0 \quad \text{where}$$

m1105

Marginal note. m1105 This notation is not at all adequate (wrongly inspired by $\tau_{g,\nu|r}$) the sequel shows (and what precedes already showed) that the notation $\Gamma_{\rho,\sigma}$ would be suitable, inspired by $\Gamma_{g,\nu}$ and $\Gamma_{0,3}$.

and the composite

$$(22)\quad \mathcal{M}_{\rho,\sigma}(0) \hookrightarrow \mathcal{M}_{\rho,\sigma}[0] \longrightarrow \tau_{\rho,\sigma}$$

is an isomorphism, whence we have

$$(23)\quad \mathcal{M}|\mathcal{G}_{\rho,\sigma}(0) \simeq \tau_{\rho,\sigma}|\tau'_{\rho,\sigma} \hookrightarrow T_0 \times T_\rho \times N'_\sigma$$

414

Scans 416–434

[scan 416]

Composition with the canonical projection to $T_\rho \times N'_\sigma$ gives a monomorphism
m1107

Marginal note. m1107 for we shall have

$$T_0 \xrightarrow{\det}_{\sim} \mathbb{G}_m$$

$$\begin{array}{ccc} \mathcal{T}_{\rho,\sigma} & \hookrightarrow & T_\rho \times N'_\sigma \\ \wr & & \\ \{(\underline{a},\underline{b}) \mid (\det \underline{a}/\det \underline{b})^2 = 1\} & & \text{i.e. } \det \underline{a} = \varepsilon' \det \underline{b} \text{ with } \varepsilon'^2 = 1 \end{array} \tag{24}$$

and we shall therefore have

$$\begin{cases} \chi(\underline{a},\underline{b}) = \det \underline{b} \\ \varepsilon_2(\underline{a},\underline{b}) = \varepsilon_\sigma(\underline{b}) \\ \varepsilon_3(\underline{a},\underline{b}) = \det(\underline{a})/\det(\underline{b}) = \det \underline{b}/\det \underline{a} \end{cases} \tag{25}$$

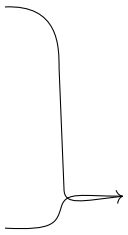
We define

$$\begin{array}{ccc} \mathcal{T}^{\circ}_{\rho,\sigma} & = \operatorname{Ker} \mathcal{T}_{\rho,\sigma} \xrightarrow{(\varepsilon_2,\varepsilon_3)} \mu_2 \times \mu_2 \\ \wr & & \\ T_\rho \times_{\mathbb{G}_m} T_\sigma & & \end{array} \tag{26}$$

so we have

$$1 \longrightarrow \mathcal{T}^{\circ}_{\rho,\sigma} \longrightarrow \mathcal{T}_{\rho,\sigma} \longrightarrow \mu_2 \times \mu_2 \longrightarrow 1 \tag{27}$$

and a canonical exact sequence



$$1 \longrightarrow \overbrace{ST_\rho \times ST_\sigma}^{\mathcal{T}^{\circ+}_{\rho,\sigma}} \longrightarrow \mathcal{T}^{\circ}_{\rho,\sigma} \xrightarrow{\chi} \mathbb{G}_m \longrightarrow 1, \tag{28}$$

where we define

$$\begin{cases} ST_\rho = \{g \in \Gamma T_\rho \mid \det g = 1\} \\ ST_\sigma = \{g \in \Gamma T_\sigma \mid \det g = 1\} \end{cases} . \tag{29}$$

m1108

Marginal note. m1108

The operation of $\mathcal{T}_{\rho,\sigma} \simeq \mathcal{M}_{\rho,\sigma}(0)$ on L_0 is given by

$$g(\varepsilon_0(\lambda)) = \varepsilon_0(\mu\lambda), \quad \text{where } \mu = \chi(g) \tag{30}$$

i4

We let $\mathcal{M}_{\rho,\sigma}(0)(\simeq \mathcal{T}_{\rho,\sigma})$ operate on SG, by

$$\begin{array}{ccccccc} \mathcal{M}_{\rho,\sigma}(0) & \xrightarrow{\text{projection}} & T_0 & \xrightarrow[\text{(monomorphism)}]{\text{canonical}} & PG & \xrightarrow{\sim} & \underline{\mathrm{Aut}}_{\mathrm{gr}}(SG) \\ \cap & & \cap & & \wr & & \\ T_0 \times T_\rho \times N'_\sigma & & G & & G/\mathbb{G}_m \simeq \underline{\mathrm{Aut}}(G) & & \end{array} \tag{31}$$

[scan 417]

[p. 510]

and we define

$$\mathcal{M}_{\rho,\sigma} \simeq \mathcal{M}_{\rho,\sigma}(0) \,.\, SG \tag{32}$$

$\frac{1}{2}$ direct product

We thus have a canonical homomorphism

$$SG \xhookrightarrow{j} \mathcal{M}_{\rho,\sigma} \tag{33}$$

whose image is denoted $\widetilde{\mathcal{G}}^{+}_{\rho,\sigma}$, so

$$(34) \qquad 1 \longrightarrow \widetilde{\mathcal{G}}^{+}_{\rho,\sigma} \longrightarrow \mathcal{M}_{\rho,\sigma} \longrightarrow \mathcal{T}_{\rho,\sigma} \longrightarrow 1$$

$$(35) \qquad \mathcal{M}_{\rho,\sigma} \simeq \mathcal{M}_{\rho,\sigma}(0) \;.\; \widetilde{\mathcal{G}}^{+}_{\rho,\sigma} \quad \wr \quad \mathcal{T}_{\rho,\sigma}$$

$\frac{1}{2}$ direct product.

N.B. We use the notation $\mathcal{T}_{\rho,\sigma}$ for the quotient group

$$(36) \qquad \mathcal{T}_{\rho,\sigma} \simeq \mathcal{M}_{\rho,\sigma}/\widetilde{\mathcal{G}}^{+}_{\rho,\sigma},$$

the notation $\mathcal{M}_{\rho,\sigma}[0]$ for the subgroup of $\mathcal{M}_{\rho,\sigma}$.

We define a canonical embedding

$$(37) \qquad \mathcal{M}_{\rho,\sigma}[0] \overset{i}{\hookrightarrow} \mathcal{M}_{\rho,\sigma}$$

which extends the inclusions of the subgroups|of the subgroup $\mathcal{M}_{\rho,\sigma}(0)$ common to $\mathcal{M}_{\rho,\sigma}[0]$ and to $\mathcal{M}_{\rho,\sigma}$, and which on L_0 is given by

$$(38) \qquad i(\lambda) = j(\lambda) \qquad \text{(cf. (33))}$$

(which is indeed compatible with the operations of $\mathcal{M}_{\rho,\sigma}(0)$ on L_0 on the one hand, on $SG \simeq \widetilde{\mathcal{G}}^{+}_{\rho,\sigma}$ on the other).
416

Apparatus for this scan

140-3-s417-D001 *deletion. Manuscript:* $\mathcal{T}|\mathcal{M}$
Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 418]

Another way of saying it is to observe that $\mathcal{M}_{\rho,\sigma}(0)$ operating on $SG \simeq \widetilde{\mathcal{G}}^{+}_{\rho,\sigma}$ normalizes the subgroup $j(L_0)$ – which we henceforth identify with L_0), so that we shall have a subgroup

$$\mathcal{M}_{\rho,\sigma}(0) \,.\, L_0 \subset \mathcal{M}_{\rho,\sigma}$$

which is|will be canonically isomorphic to $\mathcal{M}_{\rho,\sigma}[0]$ defined above, thanks to the expression (19|49) of the latter as a $\frac{1}{2}$-direct product.

d1 Remark.i1 We have

$$\mathcal{M}_{\rho,\sigma}[0] \subset \underline{\mathrm{Norm}}_{\mathcal{M}_{\rho,\sigma}}(L_0)$$

By construction, d3 the inclusion in the reverse direction would amount to saying that L_0 is its own normalizer in $SG \simeq \widetilde{\mathcal{G}}^{+}_{\rho,\sigma}$, which of course is not true at all – even though the analogous fact is true in the profinite group $\widehat{\widetilde{\mathcal{G}}^{+}_{0,3}}$, for the subgroup generated by ε_0, or in $\Pi_{0,\hat{3}}$ for the one generated by l_0 (subject to verification ! besides which I still haven't done).

Marginal note. m1109 $\mathcal{M}^{\circ}_{\rho,\sigma}, \mathcal{M}^{+}_{\rho,\sigma}, \mathcal{M}^{+\circ}_{\rho,\sigma}, \mathcal{T}^{\circ}_{\rho,\sigma}, \mathcal{T}^{+}_{\rho,\sigma}, \mathcal{T}^{\circ+}_{\rho,\sigma}$ ... some central subgroups and computations of integral points...

3°

We denote by $\mathcal{M}^{\circ}_{\rho,\sigma}$, $\mathcal{M}_{\rho,\sigma}[0]^{\circ}$, $\mathcal{M}_{\rho,\sigma}[0)^{\circ}$ identity components, we shall have for example

$$(39)\qquad \begin{array}{ccccccccc} 1 & \longrightarrow & \mathcal{M}^{\circ}_{\rho,\sigma} & \longrightarrow & \mathcal{M}_{\rho,\sigma} & \to & \mu_2 \times \mu_2 & \to & 1 \\ & & \wr\| & & & & & & \\ & & \mathcal{M}^{\circ}_{\rho,\sigma}(0)\,.\,\widetilde{\mathcal{G}}^{+}_{\rho,\sigma} & & & & & & \end{array}$$

$\frac{1}{2}$ direct product

$$(40)\qquad \mathcal{M}_{\rho,\sigma}(0)^{\circ} \xrightarrow{\sim} \mathcal{T}^{\circ}_{\rho,\sigma} \simeq T_{\rho} \times_{\mathbb{G}_m} T_{\sigma}$$

$$(41)\qquad \begin{array}{l} \mathcal{M}^{\circ}_{\rho,\sigma} \text{ is the inverse image of } \mathcal{T}^{\circ}_{\rho,\sigma} \\ \text{under } \mathcal{M}_{\rho,\sigma} \overset{\text{canonical}}{\longrightarrow} \mathcal{T}_{\rho,\sigma}\ , \end{array}$$

we have a canonical composite homomorphism

$$(42)\qquad \mathcal{M}_{\rho,\sigma} \longrightarrow \mathcal{T}_{\rho,\sigma} \xrightarrow{\chi} \mathbb{G}_m$$

also denoted χ, its kernel is denoted $\mathcal{M}^{+}_{\rho,\sigma}$, and we define in the $=$ way $\mathcal{M}^{\circ+}_{\rho,\sigma}$, so

$$(43)\qquad \begin{array}{ccccccccc} 1 & \longrightarrow & \mathcal{M}^{+}_{\rho,\sigma} & \longrightarrow & \mathcal{M}_{\rho,\sigma} & \xrightarrow{\chi} & \mathbb{G}_m & \longrightarrow & 1 \\ & & \cup| \downarrow & & \cup| \downarrow & & \cup| \downarrow & & \\ 1 & \longrightarrow & \mathcal{M}^{\circ+}_{\rho,\sigma} & \longrightarrow & \mathcal{M}^{\circ}_{\rho,\sigma} & \xrightarrow{\chi} & \mathbb{G}_m & \longrightarrow & 1 \end{array}$$

$$(44)\qquad \begin{cases} \mathcal{M}^{+}_{\rho,\sigma} \simeq \underbrace{\mathcal{M}^{+}_{\rho,\sigma}(0)}_{\wr\,\mathcal{T}^{+}_{\rho,\sigma}} .\widetilde{\mathcal{G}}^{+}_{\rho,\sigma} \\ \mathcal{M}^{\circ+}_{\rho,\sigma} \simeq \underbrace{\mathcal{M}^{\circ+}_{\rho,\sigma}(0)}_{\wr\,\mathcal{T}^{\circ+}_{\rho,\sigma}\simeq ST_\rho\times ST_\sigma \text{ cf. (28)}} .\widetilde{\mathcal{G}}^{+}_{\rho,\sigma} \end{cases}$$

Thus we have

$$(45)\qquad \begin{aligned} \mathcal{M}^{\circ+}_{\rho,\sigma}(0) &\overset{\text{dfn}}{=} \mathrm{Ker}\left(\mathcal{M}^{\circ}_{\rho,\sigma}(0) \xrightarrow{\chi,\varepsilon_2,\varepsilon_3} \mathbb{G}_m \times \mu_2 \times \mu_2 \right) \\ &\simeq ST_\rho \times ST_\sigma \end{aligned}$$

and this subgroup is <u>central</u> in $\mathcal{M}^{\circ}_{\rho,\sigma}$ (not in $\mathcal{M}_{\rho,\sigma}$), more precisely

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 420]

we have

$$(46)\qquad \begin{aligned} \mathcal{M}^{\circ+}_{\rho,\sigma} &\overset{\text{dfn}}{=} \mathrm{Ker}(\mathcal{M}_{\rho,\sigma} \xrightarrow{(\chi,\varepsilon_2,\varepsilon_3)} \mathbb{G}_m \times \mu_2 \times \mu_2) \\ &\simeq \underbrace{ST_\rho \times ST_\sigma}_{\subset \mathcal{M}_{\rho,\sigma}(0)} \times \widetilde{\mathcal{G}}^{+}_{\rho,\sigma} \end{aligned}$$

m1110

Marginal note. m1110 The whole end of the number should come after (or before) the number 6° about the "radicalities"

m1111

Marginal note. m1111 ∘ Careful, this inclusion is not an equality, cf. below…

$$(47)\qquad \underline{\mathrm{Centr}}(\mathcal{M}^{\circ}_{\rho,\sigma}) \supset \underbrace{1 \times ST_\rho \times ST_\sigma}_{\cap\ \mathcal{M}_{\rho,\sigma}(0)^\circ} \times \underbrace{\mu_2}_{\cap\ \widetilde{\mathcal{G}}^{+}_{\rho,\sigma}\simeq SG} .$$

Hence a subgroup

$$(48)\qquad \mu_2 \times \mu_2 \times \mu_2 \subset 1 \times \underbrace{ST_\rho \times ST_\sigma \times \mu_2}_{\cap\ \mathrm{Centr}(\mathcal{M}^{\circ}_{\rho,\sigma})}$$

which is in fact contained in the Center of $\mathcal{M}_{\rho,\sigma}$ as a whole, for

$$(49)\qquad \underline{\mathrm{Centr}}(\mathcal{M}_{\rho,\sigma}) \supset \underbrace{1 \times S'T_\rho \times \mu_2}_{\cap\ \mathcal{M}_{\rho,\sigma}(0)} \times \underbrace{\mu_2}_{\cap\ \widetilde{\mathcal{G}}^{+}_{\rho,\sigma}\simeq SG}$$

with

$$(50)\qquad S'T_\rho \overset{\text{dfn}}{=} \{g \in \Gamma T_\rho \mid (\det g)^2 = 1\}$$

id.

so that we have

$$(51)\quad 1 \longrightarrow ST_\rho \longrightarrow S'T_\rho \xrightarrow{\varepsilon_3} \mu_2 \longrightarrow 1$$

We thus have

$$(52)\qquad \mathrm{Centr}(\mathcal{M}_{\rho,\sigma}) \cap \mathcal{M}^\circ_{\rho,\sigma} \supset \underset{\cap}{1}_{T_0} \times \underset{\cap}{ST}_{T_\rho} \times \underset{\cap}{\mu_2}_{T_\sigma} \times \underset{\cap}{\mu_2}_{\widetilde{\mathcal{G}}^+_{\rho,\sigma}} .$$

id.

The "modular case" is the one where

$$(53)\qquad \begin{cases} \det\rho = 1 \quad \text{i.e.} \quad \det\sigma = 1 \quad \text{i.e.} \quad \nu = -1 \\ \text{i.e.} \quad \rho = \begin{pmatrix} 0 & 1 \\ -1 & 1 \end{pmatrix} \quad \text{i.e.} \quad \sigma = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} \end{cases}$$

(cf. VI for other characterizations, such as $\sigma^2 = -1$, or $\rho^2 - \rho + 1 = 0$, or $\tilde{\sigma}^2 = \tilde{\rho}^3 = 1$ ...), this also means that ρ (as an element of T_ρ) is in ST_ρ hence in the center of $\mathcal{M}^\circ_{\rho,\sigma}$,
419

[p. 513]

d1normali1 but not central in $\mathcal{M}_{\rho,\sigma}$ as a whole)

the group

$$\mathcal{M}_{\rho,\sigma}/S\mathcal{R}^{\circ}_{\rho,\sigma} = \mathcal{M}^{\natural}_{\rho,\sigma} \tag{63}$$

is therefore an extension of $\mu_2 \times \mu_2$ by

$$\mathcal{M}^{\circ}_{\rho,\sigma}/S\mathcal{R}^{\circ}_{\rho,\sigma} \overset{\text{dfn}}{=} \mathcal{M}^{\circ\natural}_{\rho,\sigma},$$

isomorphic to G via Θ° (since $S\mathcal{R}^{\circ}_{\rho,\sigma} = \operatorname{Ker}\Theta^{\circ}$), hence

$$1 \longrightarrow G \longrightarrow \mathcal{M}^{\natural}_{\rho,\sigma} \longrightarrow \mu_2 \times \mu_2 \longrightarrow 1, \tag{64}$$

moreover the homomorphism

$$\Theta : \mathcal{M}_{\rho,\sigma} \longrightarrow G$$

being trivial on $\mathcal{R}_{\rho,\sigma}$ passes to the quotient as

$$\Theta^{\natural} : \mathcal{M}^{\natural}_{\rho,\sigma} \longrightarrow G, \tag{65}$$

whose restriction to G (via (64)) is the identity, so we find, via (64),

$$\mathcal{M}^{\natural}_{\rho,\sigma} \simeq G \times \mu_2 \times \mu_2. \tag{66}$$

We thus find

$$\begin{array}{ccccccccc} 1 & \longrightarrow & S\mathcal{R}^{\circ}_{\rho,\sigma} & \longrightarrow & \mathcal{M}_{\rho,\sigma} & \xrightarrow{(\Theta,\varepsilon_3,\varepsilon_2)} & \mathcal{M}^{\natural}_{\rho,\sigma} & \longrightarrow & 1. \\ & & \wr\vert & & & & \wr\vert & & \\ & & ST_\rho \times ST_\sigma & & & & G \times \mu_2 \times \mu_2 & & \end{array} \tag{67}$$

To see how $\mathcal{M}^{\natural}_{\rho,\sigma} \simeq G \times \mu_2 \times \mu_2$ operates on $ST_\rho \times ST_\sigma$, we d2note that$^{\text{i2d3}}$ $\mathcal{M}^{\circ}_{\rho,\sigma}$ is the inverse image of $G \simeq \mathcal{M}^{\natural\circ}_{\rho,\sigma}$ d4 in the extension (67), where $S\mathcal{R}_{\rho,\sigma}$ is central in $\mathcal{M}_{\rho,\sigma}$, so G operates trivially on it.

of $\mathcal{M}^{\circ\natural|\sharp}_{\rho,\sigma} = \mathcal{M}^{\circ}_{\rho,\sigma}/S\mathcal{R}_{\rho,\sigma} \simeq G$, it remains to prove that $\mathcal{R}_{\rho,\sigma}$ is central in $\mathcal{M}^{\circ}_{\rho,\sigma}$. But [d1] $\mathcal{M}^{\circ}_{\rho,\sigma}$ is generated [d2] by $\mathcal{R}^{\circ}_{\rho,\sigma}$ and by $\widetilde{\mathcal{G}}^{+}_{\rho,\sigma} \simeq SG$, since

$$\mathcal{R}^{\circ}_{\rho,\sigma} \longrightarrow \mathcal{T}^{\circ}_{\rho,\sigma} \simeq \mathcal{M}^{\circ}_{\rho,\sigma}/\widetilde{\mathcal{G}}^{+}_{\rho,\sigma}$$

is an epimorphism (73)(74), and since $\mathcal{R}_{\rho,\sigma}$ is commutative (74), it remains to show that it commutes with $\widetilde{\mathcal{G}}^{+}_{\rho,\sigma}$ i.e. operates trivially on $\widetilde{\mathcal{G}}^{+}_{\rho,\sigma}$. Now a section of $\mathcal{R}^{\circ}_{\rho,\sigma}$ is of the form

$$(j_{T_0}(\mu^2), \underline{a}, \underline{b}) \cdot (\lambda j_{T_0}(\mu^{-2}))$$

the first factor operating as [d3]

$$i. \qquad \operatorname{int} j_G(\mu^2)$$

the second as

$$\operatorname{int} j_G(\mu^{-2})$$

so their product operates trivially, q.e.d.

[d4] Let us now note that[i1]

$$\mathcal{R}^{\circ}_{\rho,\sigma} \cap \underbrace{\widetilde{\mathcal{G}}^{+}_{\rho,\sigma}}_{\shortparallel\, SG} = \operatorname{Ker}(\mathcal{R}^{\circ}_{\rho,\sigma} \longrightarrow \mathcal{T}^{\circ}_{\rho,\sigma}) \underset{\text{cf. (74)}}{=} \mu_2 \tag{75}$$

(we can also say more directly, that

[p. 515]

$\mathcal{R}^{\circ}_{\rho,\sigma} \cap \widetilde{\mathcal{G}}^{+}_{\rho,\sigma}$, being contained in the center of $\widetilde{\mathcal{G}}^{+}_{\rho,\sigma} \simeq SG$ which is μ_2, is $\subset \mu_2$ — but this does not show equality.

Remark This gives a simpler description of $\mathcal{M}^{\circ}_{\rho,\sigma}$ than as a $\frac{1}{2}$ direct product, as follows. We define $\mathcal{R}^{\circ}_{\rho,\sigma}$ by diagram (74), whence an exact sequence

$$1 \longrightarrow \mu_2 \xrightarrow{j'} \mathcal{R}^{\circ}_{\rho,\sigma} \longrightarrow T_\rho \times_{\mathbb{G}_m} T_\sigma \longrightarrow 1 \tag{77}$$

and we define $\mathcal{M}^{\circ}_{\rho,\sigma}$ as a central amalgamated sum

$$\begin{array}{ccccccccc} 1 & \longrightarrow & \mu_2 & \longrightarrow & \mathcal{R}^{\circ}_{\rho,\sigma} \times \limits_{SG}^{\widetilde{\mathcal{G}}^{+}_{\rho,\sigma}} & \longrightarrow & \mathcal{M}^{\circ}_{\rho,\sigma} & \longrightarrow & 1 \\ & & \varepsilon & \longmapsto & (j'(\varepsilon), j''(\varepsilon^{-1})) & & & & \end{array} \tag{78}$$

(where j' is given in (77) and $j'' : \mu_2 \longrightarrow SG = \widetilde{\mathcal{G}}^{+}_{\rho,\sigma}$ the canonical morphism).

Let us note that we have in the = way a well-known [d3]description[i2] of G in terms of SG

$$\begin{array}{ccccccccc} 1 & \longrightarrow & \mu_2 & \longrightarrow & \mathbb{G}_m \times SG & \longrightarrow & G & \longrightarrow & 1 \\ & & \varepsilon & \longmapsto & (\varepsilon, j''(\varepsilon^{-1})) & & & & \end{array} \tag{79}$$

and we will have a homomorphism from (78) to (79), thanks to the canonical homomorphism

$$\mathcal{R}^{\circ}_{\rho,\sigma} \longrightarrow \mathbb{G}_m \qquad \text{of (74)}, \tag{80}$$

[scan 428]

which by passage to the quotient in|of the

$$\mathcal{R}^{\circ}_{\rho,\sigma} \times SG \xrightarrow{\widetilde{\Theta}^{\circ}} \mathbb{G}_m \times SG$$

makes it possible to reconstruct

$$\Theta^{\circ} : \quad \mathcal{M}^{\circ}_{\rho,\sigma} \longrightarrow G \ ,$$

just like the group $\mathcal{M}^{\circ}_{\rho,\sigma}$ it-=, in terms of the group schemes[i1] ($\pm$ toric) "in the air" T_ρ, T_σ and the epimorphisms

$$T_\rho \xrightarrow{\delta_\rho} \mathbb{G}_m \ , \qquad T_\sigma \xrightarrow{\delta_\sigma} \mathbb{G}_m \ ,$$

and the form G of $\mathrm{Gl}(2)_S$ of course (without having to use = embeddings $T_\rho \longrightarrow G, T_\sigma \longrightarrow G$, and still less sections ρ, σ of G ...). We find $\widetilde{\mathcal{G}}^{+}_{\rho,\sigma}$ as the image of SG, in $\mathcal{M}^{\circ}_{\rho,\sigma}$,[i2 d1 d2]

$$\mathcal{T}^{\circ}_{\rho,\sigma} \overset{\text{dfn}}{=} \mathcal{M}^{\circ}_{\rho,\sigma}/\widetilde{\mathcal{G}}^{+}_{\rho,\sigma} \simeq \begin{array}{c} \mathcal{R}^{\circ}_{\rho,\sigma}/\mu_2 \\ \wr\vert \\ T_\rho \times_{\mathbb{G}_m} T_\sigma \end{array}$$

But for our purpose, the splitting "askew"[i3] of the extension thus constructed of $\mathcal{T}^{\circ}_{\rho,\sigma}$ by $\widetilde{\mathcal{G}}^{+}_{\rho,\sigma} \simeq SG$, corresponding to the section subgroup $\mathcal{M}^{\circ}_{\rho,\sigma}(0)$, will play an essential role — by composing this section

[scan 429]

[p. 516]

$$\mathcal{T}^{\circ}_{\rho,\sigma} \simeq T_\rho \times_{\mathbb{G}_m} T_\sigma \longrightarrow \mathcal{M}^{\circ}_{\rho,\sigma}$$

with

$$\mathcal{M}^{\circ}_{\rho,\sigma} \longrightarrow G$$

we find a homomorphism which factors in turn as

$$\mathcal{T}^{\circ}_{\rho,\sigma} \simeq T_\rho \times_{\mathbb{G}_m} T_\sigma \xrightarrow[\text{canonical}]{\text{epimorphism}} \mathbb{G}_m \xhookrightarrow[j_G]{\text{monomorphism}} G$$

whose image is the torus T_0 ... .

Remark We can think of constructing $\mathcal{M}_{\rho,\sigma}$ in an analogous way, by introducing the inverse image — let us denote it by $\mathcal{R}^{\sim|\infty}_{\rho,\sigma}$ — of $\mathbb{G}_m \times \mu_2 \times \mu_2$ under

$$\mathcal{M}_{\rho,\sigma} \longrightarrow G \times \mu_2 \times \mu_2$$

(67) — whose intersection with $\widetilde{\mathcal{G}}^{+}_{\rho,\sigma} \simeq SG$ obviously equal to μ_2, since
m1118

Marginal note. m1118 N.B. $\mathcal{R}_{\rho,\sigma}$ is also, more simply, the kernel of the composite homomorphism

$$\widetilde{\Theta}: \quad \mathcal{M}_{\rho,\sigma} \xrightarrow{\Theta} G \xrightarrow{\text{canonical}} PG$$

so we have exact sequence

$$(81) \qquad 1 \longrightarrow \mathcal{R}_{\rho,\sigma} \longrightarrow \mathcal{M}_{\rho,\sigma} \longrightarrow PG \longrightarrow 1$$

$$\mathcal{R}^{\circ}_{\rho,\sigma} = \mathcal{R}^{\sim|\infty}_{\rho,\sigma} \cap \mathcal{M}^{\circ}_{\rho,\sigma} = (\mathcal{R}^{\sim|\infty}_{\rho,\sigma})^{\circ} \quad \text{(identity component)}$$

d2

I am not going to spell out here the construction of $\mathcal{R}^{\sim|\infty}_{\rho,\sigma}$ in terms of T_ρ, N'_σ etc., not being sure that it will be needed later on.

[scan 430]

In the modular case, over the absolute base $\mathbb{Z}$, we will have

$$(81)\qquad \left(\begin{array}{ccc} S\mathcal{R}^{\circ}_{\rho,\sigma}(\mathbb{Z}) & \twoheadrightarrow \mathcal{T}^{\circ}_{\rho,\sigma}(\mathbb{Z}) \twoheadrightarrow & T_\rho(\mathbb{Z})\times T_\sigma(\mathbb{Z}) \simeq \mathbb{Z}/6\mathbb{Z}\times\mathbb{Z}/4\mathbb{Z} \\ \| & & \text{since } T_\rho(\mathbb{Z}) = ST_\rho(\mathbb{Z}) \\ ST_\rho(\mathbb{Z})\times ST_\sigma(\mathbb{Z}) & & T_\sigma(\mathbb{Z}) = ST_\sigma(\mathbb{Z}) \end{array}\right.$$

whence, via (74)

$$(82)\qquad \mathcal{R}^{\circ}_{\rho,\sigma}(\mathbb{Z}) \simeq (\mathbb{Z}/6\mathbb{Z}\times\mathbb{Z}/4\mathbb{Z})\times\{\pm 1\}$$

the [d1] projections onto the two factors of the right-hand side correspond precisely to the homomorphisms

$$\mathcal{R}^{\circ}_{\rho,\sigma} \longrightarrow \mathcal{T}^{\circ}_{\rho,\sigma}\ , \qquad \mathcal{R}^{\circ}_{\rho,\sigma} \longrightarrow \mathbb{G}_m$$

of (74), so that the inclusion

$$(83)\qquad \mu_2(\mathbb{Z}) = \{\pm 1\} \twoheadrightarrow \mathcal{R}^{\circ}_{\rho,\sigma}(\mathbb{Z}) \simeq (\mathbb{Z}/6\mathbb{Z}\times\mathbb{Z}/4\mathbb{Z})\times\{\pm 1\}$$

is the obvious inclusion $\varepsilon \longmapsto (0)\times\varepsilon$.

A more telling way of saying this is that the canonical inclusion

$$(84)\qquad \begin{array}{ccccc} S\mathcal{R}^{\circ}_{\rho,\sigma} & \times & \mu_2 & \hookrightarrow & \mathcal{R}^{\circ}_{\rho,\sigma} \\ \| & & & & \\ ST_\rho\times ST_\sigma & & \| & & \\ \cap & & \underline{\mathrm{Centr}}(SG) & & \\ 1\,\mathcal{M}^{\circ}_{\rho,\sigma}(0) & & & & \end{array}$$

induces an isomorphism

$$(85)\qquad \underbrace{S\mathcal{R}^{\circ}_{\rho,\sigma}(\mathbb{Z})}_{\mathbb{Z}/6\mathbb{Z}\times\mathbb{Z}/4\mathbb{Z}} \times \underbrace{\mu_2(\mathbb{Z})}_{\{\pm 1\}} \xrightarrow{\ \sim\ } \mathcal{R}^{\circ}_{\rho,\sigma}(\mathbb{Z})$$

[scan 431]

[p. 517]
d1

m1119

Marginal note. [m1119] Mixed groups of the radical

$(\mathcal{R}_{\rho,\sigma}, S\mathcal{R}_{\rho,\sigma}, \mathcal{R}^{\circ}_{\rho,\sigma}, S\mathcal{R}^{\circ}_{\rho,\sigma}\ldots)$.

⑥ I am going to return to

$$(86) \qquad \mathcal{R}_{\rho,\sigma} \overset{\text{dfn}}{=} \operatorname{Ker}\left(\mathcal{M}_{\rho,\sigma} \xrightarrow{\widetilde{\Theta}} PG \right),$$

giving rise to the exact sequence

$$(87) \qquad 1 \longrightarrow \mathcal{R}_{\rho,\sigma} \longrightarrow \mathcal{M}_{\rho,\sigma} \longrightarrow PG \longrightarrow 1.$$

We will have

$$(88) \qquad \underset{\substack{\text{defined}\\ \text{in 69}}}{\mathcal{R}^{\circ}_{\rho,\sigma}} = \mathcal{R}_{\rho,\sigma} \cap \mathcal{M}^{\circ}_{\rho,\sigma} = \begin{array}{c}\text{identity component}\\ \text{of } \mathcal{R}_{\rho,\sigma}\end{array}.$$

Besides we also have

$$(89) \qquad \mathcal{R}_{\rho,\sigma} = \Theta^{-1}(\mathbb{G}_m) \qquad \left(\Theta : \ \mathcal{M}_{\rho,\sigma} \longrightarrow G\right)$$

whence an exact sequence

$$(90) \qquad \begin{array}{ccccccccc} 1 & \to & & S\mathcal{R}_{\rho,\sigma} & & \to \mathcal{R}_{\rho,\sigma} & \overset{\kappa}{\to} & \mathbb{G}_m & \to 1 \\ & & & \| \text{ dfn} & & & & & \\ & & & \begin{cases} \operatorname{Ker}\ (\mathcal{R}_{\rho,\sigma} \overset{\kappa}{\to} \mathbb{G}_m) \\ \| \\ \operatorname{Ker}(\mathcal{M}_{\rho,\sigma} \overset{\Theta}{\to} G) \end{cases} & & & & & \end{array}$$

where κ is defined by the condition that

$$(91) \qquad \begin{array}{ccccccc} \mathcal{R}_{\rho,\sigma} & \overset{\kappa}{\to} & \mathbb{G}_m & \overset{\sim}{\to} & \underline{\text{Center}}(G) & \to & G \\ & \searrow & & & & \nearrow & \\ & & & \underset{\Theta}{} & & & \end{array}$$

be commutative.

Let us note in passing that the homomorphism χ of (42) $\mathcal{M}_{\rho,\sigma} \longrightarrow \mathbb{G}_m$ can also be deduced from Θ (57) by composition

$$(92) \qquad \begin{array}{ccc} \mathcal{M}_{\rho,\sigma} & \xrightarrow{\Theta} & G \\ & {\scriptstyle\chi}\searrow \quad \swarrow{\scriptstyle\det} & \\ & \mathbb{G}_m & \end{array} \qquad)|,$$

and we will therefore have

$$(93) \qquad \chi(g) = \kappa(g)^2 \quad \text{if } g \in \Gamma\mathcal{R}_{\rho,\sigma}$$

i.e.

$$\begin{array}{ccc} \mathcal{R}_{\rho,\sigma} & \xrightarrow{\kappa} & \mathbb{G}_m \\ & {\scriptstyle\chi|\mathcal{R}_{\rho,\sigma}}\searrow \quad \swarrow{\scriptstyle\lambda\mapsto\lambda^2} & \\ & \mathbb{G}_m & \end{array} \qquad \text{commutative.}$$

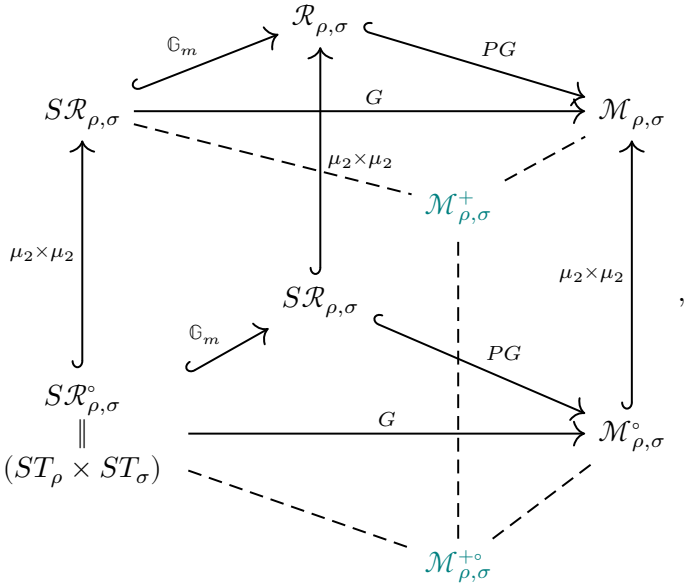
 & = \operatorname{Ker}\Theta & & = \operatorname{Ker}\widetilde{\Theta} & \\
(94)\quad \mu_2\times\mu_2\uparrow & \text{cartesian and cocartesian} & \mu_2\times\mu_2\uparrow & \text{cartesian and cocartesian} & \uparrow\mu_2\times\mu_2 \\
S\mathcal{R}^\circ_{\rho,\sigma} & \xhookrightarrow{\mathbb{G}_m} & \mathcal{R}^\circ_{\rho,\sigma} & \xrightarrow[1]{PG} & \mathcal{M}^\circ_{\rho,\sigma} \\
ST_\rho\times ST_\sigma \;/\!/ & = \operatorname{Ker}\Theta^\circ & & = \operatorname{Ker}\widetilde{\Theta}^\circ & \\
 & (62) & & (69) &
\end{array}
$$

m1120

Marginal note. m1120 N.B.

There is a check to be made, which reduces to seeing that

$$S\mathcal{R}_{\rho,\sigma} \to \mu_2 \times \mu_2 \quad \text{is an epimorphism}$$



(its kernel is $S\mathcal{R}^\circ_{\rho,\sigma}$ by definition), hence a fortiori

$$\mathcal{R}_{\rho,\sigma} \text{ — } \mu_2 \times \mu_2 \quad \text{an epimorphism}$$

(its kernel is $\mathcal{R}^\circ_{\rho,\sigma}$ by definition) — but the check is trivial.

the second row is formed of the identity components of the first, which we can rewrite more prettily still

(95)

,

in the form of a prism whose three lateral squares are both cartesian and cocartesian — thus giving rise to quotients (on parallel sides), isomorphic — the quotients that occur are

$$\mu_2 \times \mu_2, \quad \mathbb{G}_m, \quad PG \quad \text{and the extension } G \text{ of } PG \text{ by } \mathbb{G}_m.$$

We read off from this diagram, for example, the exact sequence

$$(96) \qquad 1 \to \begin{array}{c} S\mathcal{R}^{\circ}_{\rho,\sigma} \\ \simeq \\ ST_\rho \times ST_\sigma \end{array} \to \mathcal{R}_{\rho,\sigma} \xrightarrow{(\kappa,\varepsilon_3|\mathcal{R}_{\rho,\sigma},\varepsilon_2|\mathcal{R}_{\rho,\sigma})} \mathbb{G}_m \times \mu_2 \times \mu_2 \to 1 \quad ,$$

140-3-s433-D014 *deletion. Manuscript:* For the firstfirst row, it suffices to see that the|we must see that the two end terms of the first row are equal to μ_2 and equal|isomorphic to μ_2. Now we have obviously

$$\mu_2 = \underbrace{S\mathcal{R}^{\circ}_{\rho,\sigma} \cap SG}_{\operatorname{Ker}\Theta} \subset S\mathcal{R}_{\rho,\sigma} \cap SG$$

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 434]

[p. d1 519]

we note

$$\underbrace{\mathcal{R}_{\rho,\sigma}}_{\operatorname{Ker}\widetilde{\Theta}} \cap SG = \operatorname{Ker}(\widetilde{\Theta}|SG), \qquad \underbrace{\mathcal{R}^{\circ}_{\rho,\sigma}}_{\operatorname{Ker}\widetilde{\Theta}^{\circ}} \cap SG = \operatorname{Ker}(\widetilde{\Theta}^{\circ}|SG),$$

now

$$\widetilde{\Theta}|SG = \widetilde{\Theta}^{\circ}|SG = \text{canonical morphism} \quad SG \longrightarrow PG$$

whose kernel is indeed μ_2.

On the other hand we have

$$\underbrace{S\mathcal{R}_{\rho,\sigma}}_{\mathrm{Ker}\,\Theta} \cap SG = \mathrm{Ker}(\Theta|SG) = \{1\}$$

since $\Theta|SG$ is the canonical inclusion $SG \subset G$, a fortiori $S\mathcal{R}^{\circ}_{\rho,\sigma} \cap SG = \{1\}$. The fact that we have isomorphisms

$$(98) \qquad \begin{cases} S\mathcal{R}_{\rho,\sigma} \twoheadrightarrow \mathcal{T}^{+}_{\rho,\sigma} \simeq S'T_{\rho} \times SN'_{\sigma} \\ S\mathcal{R}^{\circ}_{\rho,\sigma} \twoheadrightarrow \mathcal{T}^{+\circ}_{\rho,\sigma} \simeq ST_{\rho} \times ST_{\sigma} \end{cases}$$

follows, [d3] for the second, from the comparison of (62) and (28), for the first this is deduced from it by the five lemma, since

$$S\mathcal{R}_{\rho,\sigma}/S\mathcal{R}^{\circ}_{\rho,\sigma} \xrightarrow{\sim} \mathcal{T}^{+}_{\rho,\sigma}/\mathcal{T}^{+\circ}_{\rho,\sigma} \simeq \mu_2 \times \mu_2.$$

The fact that [d4] we have isomorphisms (98) implies that in

$$\begin{array}{c} \mathcal{M}^{+}_{\rho,\sigma} \\ \| \,\mathrm{dfn} \\ \mathrm{Ker}\,|\,\mathrm{Ker}'(\chi:\mathcal{M}_{\rho,\sigma}\to\mathbb{G}_m) \end{array} \simeq \underbrace{\mathcal{M}^{+}_{\rho,\sigma}(0)}_{\simeq\mathcal{T}^{+}_{\rho,\sigma}} . \underbrace{\widetilde{\mathcal{G}}^{+}_{\rho,\sigma}}_{SG} \qquad \begin{array}{c}(\text{product } \frac{1}{2} \text{ direct} \\ \text{cf. (44)})\end{array}$$

regarded as an extension of $\mathcal{T}^{+}_{\rho,\sigma}$ by SG, there is, alongside the splitting by $\mathcal{M}^{+}_{\rho,\sigma}(0) \subset \mathcal{M}^{+}_{\rho,\sigma}$, induced by $\mathcal{M}_{\rho,\sigma}(0)$, another, splitting,

Marginal note. m1121 this is (46), which I had forgotten along the way…

who can do better!. On the other hand, the fact that $R_{\rho,\sigma} \longrightarrow \mathcal{T}_{\rho,\sigma}$ is an isogeny mod μ_2 shows that we have, up to this isogeny, a "section" of|even d3 $\mathcal{M}_{\rho,\sigma}$ itself i2 as an extension of $\mathcal{T}_{\rho,\sigma}$ by $\mathcal{G}|\mathcal{C}^{+}_{\rho,\sigma} \simeq SG$. In fact, we have

$$\begin{cases} R_{\rho,\sigma} \cap SG = \mu_2 \\ \\ R_{\rho,\sigma} \text{ commutes with } SG \end{cases} \tag{101}$$

(trivial by definition of $R_{\rho,\sigma}$ as $\operatorname{Ker} \widetilde{\Theta}$

so we have an exact sequence

[p. 521]

as a subgroup
(109)

$$\begin{array}{ccc} \mathcal{T}_{\rho,\sigma} \hookrightarrow T_0 & & \times T_\rho \times N'_\sigma \\ & \overset{\simeq}{\downarrow}\delta_0 & \\ & G_m & \end{array}$$

$$\begin{array}{c} \| \\ \left\{ \left(\underset{T_0}{\underline{u}}, \underset{T_\rho}{\underline{a}}, \underset{N'_\sigma}{\underline{b}} \right) \;\middle|\; \delta_0(\underline{u}) = \delta_\sigma(\underline{b}) = \varepsilon' \delta_\rho(\underline{a}), \quad \varepsilon'^2 = 1 \right\} \\ \simeq \left\{ \left(\underset{T_\rho}{\underline{a}}, \underset{N'_\sigma}{\underline{b}} \right) \;\middle|\; \delta_\rho(\underline{a}) = \varepsilon' \delta_\sigma(\underline{b}), \quad \varepsilon'^2 = 1 \right\} \end{array}$$

with

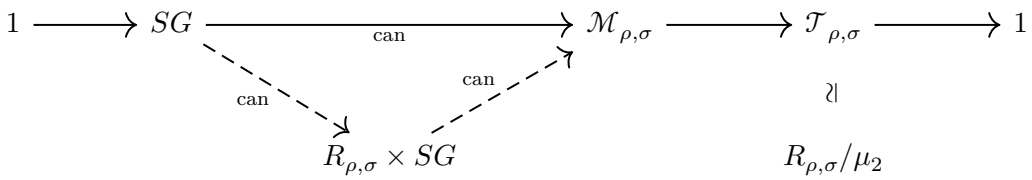
$$\begin{cases} \chi(\underline{a}, \underline{b}) = \delta_\sigma | \delta_0(\underline{b}) \\ \varepsilon_3(\underline{a}, \underline{b}) = \delta_\rho(\underline{a}) / \delta_\sigma(\underline{b}) \; . \\ \varepsilon_2(\underline{a}, \underline{b}) = \varepsilon_\sigma(\underline{b}) \end{cases} \tag{110}$$

With the help of this, we can construct $\mathcal{M}_{\rho,\sigma}$ by (102), and of course the homomorphism
(111) Θ :

$$\mathcal{M}_{\rho,\sigma} \longrightarrow G$$

is deduced by passage to the quotient from the obvious homomorphisms
(112)

$$SG \hookrightarrow G$$



,

$$\begin{array}{ccc} R_{\rho,\sigma} & \longrightarrow & G \\ & \searrow^{\kappa} & \uparrow \\ & G_m \xrightarrow[\simeq]{} & \underline{\mathrm{Centr}}(G) \end{array}$$

[d4] whence we deduce the composites
(113)

$$\begin{cases} \mathcal{M}_{\rho,\sigma} \xrightarrow{\Theta} G \longrightarrow PG \\ \qquad\qquad \widetilde{\Theta} \\ \mathcal{M}_{\rho,\sigma} \xrightarrow{\Theta} G \xrightarrow{\det} G_m \\ \qquad\qquad \chi \end{cases}$$

We also deduce the exact sequence
(114)

[scan 439]

from the description (102), whence composites
(115)

In all this, we have not needed the datum of|of the sections ρ, σ of G, nor to know anything at all about the way in which T_ρ, N'_σ [d1]have been[i1] obtained from such sections. But more delicate additional structures of the $\mathcal{M}_{\rho,\sigma}$ — such as the datum of the integral subgroups $\mathcal{M}_{\rho,\sigma}(w)|(\omega)$ — depend on them, and will perhaps allow us to recover them.

Remark|Remark The cube (96) is the "composite" of two cubical diagrams, which I am going to make explicit, the first of which completes (95) — which can be regarded as a partial diagram of this one:

[p. 438]

[scan 441]

[p. 523]

(117)

The composite front left face of the cube is of a particularly simple nature, since the middle terms $\mathcal{M}^+_{\rho,\sigma}$, $\mathcal{M}^{+\circ}_{\rho,\sigma}$ are identified simply with the direct products of the outer terms

$$\begin{array}{ll} SR_{\rho,\sigma} \xrightarrow{\sim} \mathcal{T}^+_{\rho,\sigma} & \text{and} \quad SR^\circ_{\rho,\sigma} \xrightarrow{\sim} \mathcal{T}^{+\circ}_{\rho,\sigma} \\ \simeq S'T_\rho \times SN'_\sigma & \simeq ST_\rho \times ST_\sigma \end{array}$$

with the group SG. This is almost the case too for the parallel face (back right face), up to the group μ_2 – this becomes true on[i2] on condition of replacing the [d1] middle terms $\mathcal{M}_{\rho,\sigma}$, $\mathcal{M}^\circ_{\rho,\sigma}$ by the μ_2-coverings

$$\mathcal{M}^\sim_{\rho,\sigma} \simeq R_{\rho,\sigma}\times SG, \qquad \mathcal{M}^{\circ\sim}_{\rho,\sigma} \simeq R^\circ_{\rho,\sigma}\times SG \tag{118}$$

(cf. (107)|(102), (103)), which will have also the virtue

[p. 440]

[scan 442]

delectable of making the four squares of the upper and lower faces of the two attached cubes cartesian and cocartesian, which they were not before, regrettably.

To finish these scales on the radicals I am going to introduce a canonical homomorphism

$$G_m \overset{i_R}{\hookrightarrow} R^\circ_{\rho,\sigma} \tag{118}$$

via a canonical homomorphism

$$\begin{aligned} G_m &\overset{i_{\mathcal{T}}}{\hookrightarrow} \mathcal{T}^\circ_{\rho,\sigma} \simeq T_\rho \times_{G_m} T_\sigma \\ \lambda &\longmapsto (\lambda, \lambda) \end{aligned} \tag{119}$$

of which the composite|the composite with

$$\chi : \mathcal{T}^\circ_{\rho,\sigma} \longrightarrow G_m$$

is indeed given by $\lambda \mapsto \lambda^2$ (104)[i1], so that thanks to the description (105) of $R_{\rho,\sigma}$ in terms of $\mathcal{T}_{\rho,\sigma}$[i2] as a fiber product (paraphrased as an expression of $R^\circ_{\rho,\sigma}$ in terms of $\mathcal{T}^\circ_{\rho,\sigma}$) we have a unique homomorphism (118), making the diagram commutative

[p. 441]

Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

[scan 443]

[p. 524]

$$\begin{array}{ccc} G_m & \xrightarrow{i_{\mathcal{T}}} & \mathcal{T}^\circ_{\rho,\sigma} \\ & \searrow^{i_R} & \uparrow \mathrm{can} \\ & & R^\circ_{\rho,\sigma} \end{array} \tag{120}$$

or, more prettily, the diagram of exact sequences

$$\begin{array}{ccccccccc} 1 & \longrightarrow & \mu_2 & \longrightarrow & G_m & \overset{\lambda\mapsto\lambda^2}{\longrightarrow} & G_m & \longrightarrow & 1 \\ & & & & \| & & & & \\ & & & & G_m & & & & \end{array} \quad . \tag{121}$$

By construction, we find at once

$$\begin{array}{ccccc} G_m & \xrightarrow{i_R} & R^\circ_{\rho,\sigma} & \xrightarrow{\kappa} & G_m \\ & \searrow & & \nearrow & \\ & & \mathrm{id} & & \end{array} \tag{122}$$

whence direct product decompositions

$$\begin{cases} R_{\rho,\sigma} \simeq SR_{\rho,\sigma} \times G_m \simeq S'T_\rho \times SN'_\sigma \times G_m \\ R^\circ_{\rho,\sigma} \simeq SR^\circ_{\rho,\sigma} \times G_m \\ \qquad\quad \simeq ST_\rho \times ST_\sigma \times G_m \end{cases} , \tag{123}$$

which considerably sharpens (96) with which I was nevertheless so pleased!

In terms of this decomposition, we are going to make explicit the [d1]homomorphism

$$\mu_2 \hookrightarrow R^\circ_{\rho,\sigma} \subset R_{\rho,\sigma} \qquad \Big(\text{and} \quad R_{\rho,\sigma} \twoheadrightarrow \mathcal{T}_{\rho,\sigma} \ , \quad R^\circ_{\rho,\sigma} \twoheadrightarrow \mathcal{T}^\circ_{\rho,\sigma} \Big)$$

which occurs in (102), (103), $\mu_2 = R_{\rho,\sigma} \cap SG = R^\circ_{\rho,\sigma} \cap SG$,

[d2]

[p. 442]

Apparatus for this scan

140-3-s443-D001 *deletion. Manuscript:* h

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

140-3-s443-D002 *deletion. Manuscript:* We find in the explicit description (104), that μ_2 corresponds to the $\varepsilon \in \Gamma\mu_2$, that ε [illeg. 2]

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 444]

For the homomorphism

$$R_{\rho,\sigma} \longrightarrow \underset{\underset{T_{\rho,\sigma}}{\|}}{\{(\underline{a},\underline{b}) \mid (\det \underline{a}/\det \underline{b})^2 = 1\}} \hookrightarrow T_\rho \times N'_\sigma$$

it suffices to [d1] make explicit[i2] the composites

$$\begin{cases} R_{\rho,\sigma} \longrightarrow T_{\sigma\sigma}|T_{\rho,\sigma} \nearrow T_\rho \\ \wr\| \qquad\qquad\qquad\quad \searrow N'_\sigma \\ S'T_\rho \times SN'_\sigma \times G_m \\ (\underline{a},\underline{b},\lambda) \longrightarrow (\lambda\underline{a},\lambda\underline{b}) \end{cases} \tag{124}$$

m1122

Marginal note. [m1122] we have as well

$$\underbrace{\det(\lambda\underline{a})^2}_{\substack{\lambda^2 \\ \text{since } (\det \underline{a})^2=1}} = \underbrace{\det(\lambda\underline{b})^2}_{\substack{\lambda^2 \text{ since} \\ \det \underline{b}=1}}$$

The kernel of this homomorphism therefore consists of the $(\lambda^{-1},\lambda^{-1},\lambda)$, with|where $\lambda \in \Gamma G_m$ such that $\lambda^{-1} \in \Gamma S'T_\rho$, $\lambda^{-1} \in \Gamma SN'_\sigma$, [d2] i.e. $(\lambda^2)^2 = 1$ and $\lambda^2 = 1$, i.e. $\lambda \in \Gamma\mu_2$. Thus

$$\begin{cases} \overset{\mu_2}{\underset{\|}{R_{\rho,\sigma} \cap SG}} \xrightarrow{\text{can}} \underbrace{R^\circ_{\rho,\sigma}}_{ST_\rho \times ST_\sigma \times G_m} \subset \underbrace{R_{\rho,\sigma}}_{S'T_\rho \times SN'_\sigma \times G_m} . \\ \lambda \longmapsto (\lambda,\lambda,\lambda) \end{cases} \tag{125}$$

We thus find the particularly simple explicit description

$$\mathcal{T}_{\rho,\sigma} \simeq (S'T_\rho \times SN'_\sigma \times G_m)/ \underset{\mu_2 \text{ sent "diagonally" into the triple product}}{\overset{\mu_2}{\uparrow}} \tag{126}$$

We will note that we have canonical homomorphisms

$$\mu_2 \to ST_\rho \subset S'T_\rho \ , \quad \mu_2 \to ST_\sigma \subset SN'_\sigma \ , \quad \mu_2 \text{ — } G_m$$

(which are used in (125)) whence

$$\begin{cases} \mu_2 \times \mu_2 \times \mu_2 \longrightarrow \underbrace{ST_\rho \times ST_\sigma \times G_m}_{R^\circ_{\rho,\sigma}} \subset \underbrace{S'T_\rho \times SN'_\sigma \times G_m}_{R_{\rho,\sigma}} \\ (\lambda', \lambda'', \lambda) \longmapsto (\lambda', \lambda'', \lambda) \end{cases} \tag{127}$$

which is none other than (48))

[p. 443]

[scan 445]

[p. 525]

The Center of $\mathcal{M}_{\rho,\sigma}$. It maps under $\widetilde{\Theta}$ into the center of PG which is trivial, hence

$$\underline{\text{Cent}}(\mathcal{M}_{\rho,\sigma}) \subset \text{Ker}\,\widetilde{\Theta} = R_{\rho,\sigma} \simeq S'T_\rho \times SN'_\sigma \times G_m$$

whence obviously. Since $R_{\rho,\sigma}$ commutes with SG, and $R_{\rho,\sigma} \cdot SG = \mathcal{M}_{\rho,\sigma}$, we conclude

$$\underline{\text{Cent}}(\mathcal{M}_{\rho,\sigma}) = \underline{\text{Cent}}(R_{\rho,\sigma}) = S'T_\rho \times \underset{?}{\underline{\text{Cent}}}(SN'_\sigma) \times G_m \tag{128}$$

let us therefore determine $\text{Cent}(SN'_\sigma)$. Let us note that

$$\begin{cases} \mu_2 \simeq N'_\sigma/T_\sigma \quad \text{operates faithfully on } T_\sigma \\ \text{and } T_\sigma = G_m.ST_\sigma \end{cases} \quad \Big| \quad \begin{array}{l} \text{hence} \quad \mu_2 \quad \text{operates faithfully} \\ \qquad\quad \wr| \\ \qquad SN'_\sigma/T_\sigma \\ \text{on } ST_\sigma \end{array}$$

whence

$$\underline{\text{Cent}}(SN'_\sigma) \subset ST_\sigma \quad \text{whence} \quad \underline{\text{Cent}}(SN'_\sigma) \simeq (ST_\sigma)^{\mu_2}. \tag{129}$$

Now we find that

$$T_\sigma^{\mu_2} \simeq G_m \tag{130}$$

i1 d2 whence[i2]

$$\underline{\text{Cent}}(SN'_\sigma) = ST_\sigma{}^{\mu_2} = ST_\sigma \cap G_m = \mu_2 \tag{131|129}$$

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

140-3-s445-I001 *insertion. Manuscript:*

$$T_\sigma^{\mu_2} \simeq G_m \tag{130}$$

Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

140-3-s445-D002 *deletion. Manuscript:* the section -1 of μ_2 operates on ST_σ by $x \longrightarrow x^{-1}$, which shows that

$$\underline{\text{Cent}}(SN'_\sigma) \subset {}_2(ST_\sigma) = \left\{ c\sigma + d \;\middle|\; \begin{array}{l} -\nu c^2 + d^2 = 1 \\ \nu c^2 + d^2 + 2\sigma cd = 0 \end{array} \right\}$$

We have for a section of ${}_2ST_\sigma$, g|that

$$g = c\sigma + d \quad \begin{array}{l} \det g = -\nu c^2 + d^2 = 1 \\ g^2 = \nu c^2 + d^2 + 2cd\sigma = 1 \end{array}$$

$$\text{i.e.} \quad \left\{ \begin{array}{l} -\nu c^2 + d^2 = 1 \quad \nu c^2 + d^2 = 1 \\ 2cd = 0 \end{array} \right.$$

whence i.e.

$$\left\{ \begin{array}{ll} 2\nu c^2 = 0 & \text{hence } 2c^2 = 0 \quad (\text{since } \nu \text{ invertible}). \\ 2cd = 0 & \\ -\nu c^2 + d^2 = 1 & \end{array} \right.$$

if 2 invertible this amounts to

$$\left\{ \begin{array}{lll} & c^2 = 0 & \\ c^2 = 0 & d^2 = 1 & (\text{hence } d \text{ invertible}) \\ d^2 = 1 & cd = 0 & \text{hence } c = 0 \end{array} \right.$$

hence

$$\boxed{c = 0,\ d^2 = 1} \quad \text{i.e. } g \in \mu_2$$

for|hence if 2 invertible.

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 449]

[p. 527]

Let us recall that we define, in terms of (135)

$$(137)\quad \begin{cases} ST_\rho = \operatorname{Ker}\delta_\rho, \quad S'T_\rho = \operatorname{Ker}\delta_\rho^2 \\ T_\sigma = \operatorname{Ker}\varepsilon_\sigma, \quad SN'_\sigma = \operatorname{Ker}\delta'_\sigma, \quad ST_\sigma = SN'_\sigma \cap T_\sigma = \operatorname{Ker}\delta_\sigma \\ \qquad\qquad (\delta_\sigma = \delta'_\sigma | T_\sigma) \\ \mu_2 \to ST_\rho \subset S'T_\rho \qquad \text{as composite} \qquad \mu_2 \subset G_m \xrightarrow{i_\rho} T_\sigma \\ \mu_2 \to ST_\sigma \subset SN'_\sigma \qquad \text{———————} \qquad \mu_2 \subset G_m \xrightarrow{i_\sigma} T_\sigma \end{cases},$$

which determines the left-hand part of diagram (134), where $\mathcal{M}_{\rho,\sigma}$ can be considered (and defined) as quotient of the[i1 d1] sum of the four factors $SG, S'T_\rho, SN'_\sigma, G_m$, by μ_2 embedding itself in it diagonally.[i2]

This makes it possible in principle to reduce the description of the four fundamental morphisms from $\mathcal{M}_{\rho,\sigma}$ in (134) – $\Theta_G, \Theta_\rho, \Theta_\sigma$ and $\varepsilon_{3|2}$ – to their composites with the four homomorphisms $j_G, j_\rho, j_\sigma, j_\mu$ – subject to checking that the[i3 d2] of the four composites [d3]commute, and that their product of[i4 d4]their values on the images of an $\varepsilon \in \Gamma\mu_2$ is trivial.[i5 d6] We will have

$$(138)\quad \begin{cases} \Theta_G j_G : & SG \hookrightarrow G, \quad \text{canonical inclusion} \quad (136) \\ & \Theta_G j_\rho,\ \Theta_G j_\sigma \quad \text{trivial} \\ \Theta_G j_\mu : & G_m \longrightarrow G_m \quad \text{canonical inclusion} \end{cases}$$

(conditions of compatibility|compatibilities satisfied !)

finally isomorphisms

$$\begin{cases} R_{\rho,\sigma}/\mu_2 \xrightarrow{\sim} \mathcal{T}_{\rho,\sigma} \\ R^{\circ}_{\rho,\sigma}/\mu_2 \xrightarrow{\sim} \mathcal{T}^{\circ}_{\rho,\sigma} \\ SR_{\rho,\sigma} \simeq \mathcal{T}^{+}_{\rho,\sigma} \\ SR^{\circ}_{\rho,\sigma} \simeq \mathcal{T}^{+\circ}_{\rho,\sigma} \end{cases} . \tag{151}$$

(8°)

If U is an element of $\mathcal{M}_{\rho,\sigma}$, we associate to it its images under $\Theta=\Theta_G$, Θ_ρ, Θ_σ, and under
d1 χ, ε_3, ε_2, we denote them respectively

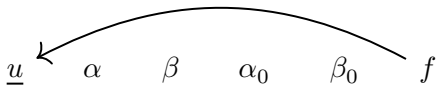
$$\begin{cases} \underline{U}\in\Gamma G \\ \underline{a}\in\Gamma T_\rho \\ \underline{b}\in\Gamma N'_\sigma \\ \mu\in\Gamma G_m \end{cases} \qquad (\varepsilon,\varepsilon'\in\Gamma\mu_2) \tag{152}$$

m1126

Marginal note. m1126 satisfying

$$\begin{cases} \mu=\delta_G(\underline{U})=\delta'_\sigma|\delta_\sigma(\underline{b})=\varepsilon'\delta_\rho(a) \\ \varepsilon'|\varepsilon=\varepsilon_\sigma(\underline{b}) \end{cases} \tag{152'}$$

thus these quantities are determined by the mere knowledge of $\underline{U},\underline{a},\underline{b}$



m1127

Marginal note. m1127

It would be necessary to make explicit that the equalities|relations (152)' characterize $\mathcal{M}_{\rho,\sigma}$ as a subgroup of $G \times T_\rho \times N'_\sigma$ – it would be necessary to carry out the verification, to see whether we have not forgotten, in (135) some hyp[ses] to be made…

N.B. $G^{\pm 1} \overset{\text{déf}}{=} \operatorname{Ker} \delta^2_G$

with notations from § 46 and following. missing however, in|for the perspective of the integral points, are the elements previously denoted

, with

$$\begin{cases} u \in \Gamma T_0 \subset \Gamma G \\ \alpha, \alpha_0 \in \Gamma G^{\pm 1} \subset \Gamma G \\ \beta, \beta_0, f \in \Gamma SG. \end{cases}$$

linked to one another and to the preceding ones,[i1] by relations

$$\begin{cases} \alpha = \underline{u}\,\underline{a}^{-1} \\ \beta = \underline{u}\,\underline{b}^{-1} \\ \underline{U} = f^{-1}\underline{u} \\ \alpha_0 = f^{-1}\alpha \\ \beta_0 = f^{-1}\beta \end{cases} \qquad \text{i.e.} \quad \underline{u} = \alpha\overline{a} = \beta b.$$

formulas in G

m1130

Marginal note. [m1130] N.B. of these 6 quantities (153), $\underline{u}$ is distinguished by the fact of being multiplicative (like the quantities (152))

m1131

Marginal note. [m1131] We could introduce

$$\begin{cases} \xi = \alpha\rho(\alpha)^{-1} \\ \eta = \varepsilon\,\beta\sigma(\beta)^{-1} \end{cases} \qquad (153)$$

$$\begin{aligned} g &= \alpha_0\rho(\alpha_0)^{-1} \\ h &= \varepsilon\,\beta_0\sigma(\beta_0)^{-1} \end{aligned}$$

but little do we care here.

[scan 454]

formulas which have a meaning only if we suppose given embeddings (or at least morphisms)

$$(155)\quad \begin{cases} T_\rho \hookrightarrow G \\ \\ T_\sigma \hookrightarrow G \end{cases} \qquad \text{and a subgroup } T_0 \hookrightarrow G \ .$$

When we have such embeddings, the formulas (154) have a meaning, and define [d1] (with the quantities (152) known) the quantities (153) in terms of one [d2]of them[i1], say $\underline{u}$, or [d3] f, or α, or β (but not in terms of α_0 or of β_0).

In fact, we have a subgroup

$$(156)\quad \Big\downarrow \text{ such that } \begin{cases} T_0 \subset G \\ T_0 \xrightarrow[\sim]{\delta_G|T_0} G_m \\ \text{i.e.} \quad G \simeq T_0.SG \\ \qquad\qquad \text{product } 1/2 \text{ direct,} \end{cases}$$

so that [d5]for $U \in \Gamma G$,[i2] there exists a unique [d6]pair $(f, u) \in \Gamma(SG \times T_0)$ with[i3]

$$U = f^{-1}\underline{u}.$$

hence unique $\alpha, \beta, \alpha_0, \beta_0 \in \Gamma G$ satisfying (with the preceding f, u) (154) :

$$(157)\quad \alpha = \underline{u}\,\underline{a}^{-1}, \quad \beta = \underline{u}\,\underline{b}^{-1}, \quad \alpha_0 = f^{-1}\alpha = f^{-1}\underline{u}\,\underline{a}^{-1}, \quad \beta_0 = f^{-1}\beta = f^{-1}\underline{u}\,\underline{b}^{-1}.$$

[scan 455]

[p. 530]

We will moreover have

$$\det \underline{u} = \det \underline{U} = \mu$$

$$\det \alpha = \underline{\det}(\underline{u}) \det(\underline{a})^{-1} = \varepsilon' \quad \text{by (152')}$$

$$\det \beta = \det(\underline{u}) \det(\underline{b})^{-1} = 1$$

$$\text{and} \quad \det \alpha_0 = \det \alpha = \varepsilon'$$

$$\det \beta_0 = \det \beta = 1$$

we will thus indeed have

$$\alpha, \alpha_0 \in \Gamma G^{\pm 1} \overset{\text{definition}}{=} \{g \mid (\det g)^2 = 1\}$$

$$\beta, \beta_0 \in \Gamma SG$$

— but we have assumed, of course, that the homomorphisms $\delta_\rho, \delta_\sigma$ of (135) are induced, via the embeddings (155), by the determinant δ_G.

To arrive at the relation or of equation

$$(157) \qquad \underbrace{[\alpha, \rho]}_{\xi} = \varepsilon \underbrace{[\beta, \sigma]}_{\eta} \varepsilon_1(\mu - 1),$$

we must give ourselves sections ρ, σ of G ([d2] more precisely probably, resp.[ti1] of maximal T_ρ and T_σ), and a strict unipotent $\varepsilon_1 \in \Gamma SG$, for the relation (157) to make sense. Let us replace α, β by some|the values $\underline{u}\,\underline{a}^{-1}, \underline{u}\,\underline{b}^{-1}$, the relation becomes (using the commutativity of T_ρ, [d3] which we had not really brought into play until now)

$$(*) \qquad [u, \rho] = \varepsilon \cdot \underline{u}(\underline{b}^{-1}\sigma(\underline{b}))\sigma(\underline{u})^{-1}\varepsilon_1(\mu - 1).$$

and will follow from the two conditions together

$$(158)\quad \begin{cases} \text{a)} & b^{-1}\sigma(b) = \varepsilon_\sigma(b) & \underline{\text{identically}} \text{ if } b \in \Gamma N'_\sigma \\ & \text{i.e.} \quad b(\sigma) = \varepsilon_\sigma(b).\sigma & \text{identically} \\ \text{b)} & [u,\rho] = [u,\sigma]\varepsilon_1(\mu - 1) & \text{identically in } u \in \Gamma T_0 \\ & & \text{for } \mu = \delta_{T_0}(u) \overset{\text{dfn}}{=} \det(u) \\ & \text{i.e.} \quad \rho(u) = \varepsilon_1(1-\mu)\sigma(u) & \text{identically in } u \end{cases}$$

which can also be written (applying σ^{-1} to the two sides|sides)

$$\sigma^{-1}\rho(u) = \varepsilon_0(1-\mu).u \qquad \text{where} \quad \varepsilon_0 = \sigma^{-1}(\varepsilon_1)$$

and is hardly conceivable unless $\underline{T_0 \text{ normalizes } L_0}$, and unless $\sigma^{-1}\rho \in \Gamma T_0.L_0$ [d1] is of the form

$$(159)\quad \begin{cases} \text{a)} & \widetilde{\sigma^{-1}\rho} = \widetilde{\varepsilon_0 u_0} \qquad u_0 \in \Gamma T_0 \\ \text{b)} & T_0 \text{ operates on } L_0 \text{ by the coaction|action induced} \\ & \qquad\qquad\qquad \text{by the determinant} \end{cases}$$

(There is all the same still some leeway, in relation|by to the draconian conditions envisaged in VII !)

But here equation (157) came a bit like hair in soup — there must be more convincing and demanding ways of bringing it in namely [d2] in connection with formulas

$$(160)\quad \begin{cases} \underline{U}(\rho) = \text{int}(\alpha_0).\rho & (= \alpha_0\rho(\alpha_0)^{-1}\rho) \\ \underline{U}(\sigma) = \varepsilon\,\text{int}(\beta_0)\sigma & (= \beta_0\sigma(\beta_0)^{-1}) \\ \underline{U}(\varepsilon_0) = \text{int}(f^{-1})(\varepsilon_0(\mu)) \end{cases} \qquad \text{i.e.} \quad \begin{matrix} [\underline{U},\rho] = \alpha\rho(\alpha)^{-1} \\ [\underline{U},\sigma] = \varepsilon\beta\sigma(\beta)^{-1} \end{matrix}$$

watch the sign ε

The third relation follows at once from $\underline{U} = f^{-1}\underline{u}$, and from the fact that by hypothesis (159 b)[i2] $\underline{u} \in \Gamma T_0$ operates on L_0 (identically) with the multiplier $\mu = \det(\underline{u})$. [p. 455]

[p. 531]

The other two formulas are made explicit successively, by writing $\alpha = \underline{u}\,\underline{a}^{-1}$, $\beta = \underline{u}\,\underline{b}^{-1}$, $\underline{U} = f^{-1}\underline{u}$

$$\alpha_0 = f^{-1}\alpha, \quad \beta_0 = f^{-1}\beta$$

$$(161) \qquad \begin{cases} \underline{u}(\rho) = \mathrm{int}(\alpha)(\rho) \\ \underline{u}(\sigma) = \varepsilon\,\mathrm{int}(\beta)(\sigma) \end{cases} \qquad \text{where } f \text{ no longer appears}$$

i.e. $\underline{u}(\rho) = \mathrm{int}(\underline{u})(\rho)$ since $\mathrm{int}(\underline{a}^{-1})\rho = \rho$ (as T_ρ commutative)

OK !

$$\underline{u}(\sigma) = \varepsilon\,\mathrm{int}(u)\,\underbrace{(\underline{b}^{-1}(\sigma))}_{\substack{=\varepsilon.\sigma \\ \text{cf. (158)(a)}}} = \mathrm{int}(u)\sigma \quad \text{OK !}$$

To prove (160) we have used only (158 a) and (159) (b). Let us now try to deduce from them the "loop relation" (157) — it must be a formal calculation, which I must already have done a dozen times, in contexts which become differentiated as we go along ! We eliminate f by writing the relations (160) in the equivalent form (161) and

$$(161 \text{ bis}) \quad \underline{u}(\varepsilon_0) = \varepsilon_0(\mu) \qquad \text{i.e.} \quad \underbrace{[\underline{u}, \varepsilon_0]}_{u\varepsilon_0(u)^{-1}} = \varepsilon_0(\mu - 1)$$

now $[\underline{u}, \varepsilon_0] = u\ \underbrace{\varepsilon_0(u)^{-1}}_{\text{i.e. } \sigma^{-1}\rho(u)}$

i.e. $\sigma([u, \varepsilon_0]) = \sigma(u)\rho(u)^{-1}$

now $\xi \overset{\text{dfn}}{=} \alpha\rho(\alpha)^{-1}$

$u\rho u^{-1}\rho^{-1} = \xi$

$\rho(u^{-1}) = u^{-1}\xi$

$\rho(u) = \xi^{-1}u$

of = |likewise $\sigma(u) = \eta^{-1}u$ $\eta \overset{\text{dfn}}{=} \varepsilon\beta\sigma(\beta)^{-1}$

hence $\sigma([u, \varepsilon_0]) = \eta^{-1}\xi$

and (*)|(α) becomes, on applying σ

$$\eta^{-1}\xi = \varepsilon_1(\mu - 1) \qquad \text{i.e.} \quad \xi = \eta\varepsilon_1(\mu - 1) \qquad \text{i.e. (157)}$$

OK ! [p. 456]

[scan 458]

In summary :

Proposition Let us suppose given, in addition to the data of the preceding section 7° (page 526' and following }|), in particular (135)(136)), d1 the following

(162)
$$\begin{cases} \text{a)} & \text{section } \rho \in \Gamma T_\rho, \quad \sigma \in \Gamma T_\sigma \quad \underline{\text{central}} \text{ sections} \\ \text{b)} & \text{Embeddings} \quad T_\rho \hookrightarrow G\ , \quad N'_\sigma \longrightarrow G \\ \text{c)} & \text{torus} \quad T_0 \hookrightarrow G \quad \text{such that } \delta_G : \quad T_0 \xrightarrow{\sim} G_m \\ & \text{i.e.} \quad G \simeq T_0.SG \quad \text{(semidirect)} \\ \text{d)} & \varepsilon_0 \in \Gamma G \quad \text{regular unipotent, defining} \\ & \text{thus} \quad \lambda \longmapsto \varepsilon_0(\lambda) \ : \quad G_a \hookrightarrow SG \end{cases}$$

and let us suppose d3

a) $\delta_G|T_\rho = \delta_\rho, \quad \delta_G|N'_\sigma = \delta_\sigma$

(163)
b) $\mathrm{int}(\underline{b})(\sigma) = \varepsilon_\sigma(\underline{b})\sigma$ in G identically for $\underline{b} \in \Gamma N'_\sigma|N'^2_\sigma$

c) T_0 normalizes L_0, and we have $u(\varepsilon_0(\lambda)) = \varepsilon_0(\mu\lambda)$ where $\mu = \delta_G(u)$

d) $\widetilde{\sigma|\rho}^{-1}\tilde{\rho} \in \Gamma\tilde{\varepsilon}_0\widetilde{L}_0$ i.e. $\exists$locally^{t} section $\lambda_0 \in \Gamma G_m$ with $\lambda_0\tilde{\sigma}^{-1}\tilde{\rho} = \varepsilon_0 u_0$, with $u_0 \in \Gamma T_0$

m1134

links L_0, T_0

Marginal note. m1134 links L_0, T_0 ρ, σ

Under these conditions, we have for every system (152) satisfying the relations (152') (i.e. in fact for every [d7] section of $\mathcal{M}_{\rho,\sigma}$!) a unique system (153), satisfying the relations (154) — namely $\underline{U}$ can be written uniquely in the form

$$(164) \quad \underline{U} = f^{-1}\underline{u}, \qquad f \in \Gamma SG, \quad \underline{u} \in \Gamma T_0$$

and we put

$$(165) \quad \alpha = \underline{u}\,\underline{a}^{-1}, \quad \beta = \underline{u}\,\underline{b}^{-1}, \quad \alpha_0 = f^{-1}\alpha|\alpha_\rho = f^{-1}\underline{u}\,\underline{a}^{-1},$$
$$\beta_0 = f^{-1}\beta = f^{-1}\underline{u}\,\underline{b}^{-1}.$$

[p. 532]

All this being laid down, we then have the formulas (160), (161), (161 bis), and the "loop" formula (157).

We now ask ourselves the question under what conditions knowledge of (α, β, f) (for example) among the quantities (153), allows us to recover the quantities (152) — i.e. a section of $\mathcal{M}_{\rho,\sigma}$

— and what conditions must be imposed on (α, β, f). It would suffice (for uniqueness)[i1] to be able to construct $\underline{u}$, whence $\underline{U}, \underline{a}, \underline{b}$ by the first three formulas (154). [d1] We must therefore find $\underline{a} \in \Gamma T_\rho$ such that $\alpha\underline{a}$ is a section of T_0, — indeterminacy in $\underline{a}$ is by $\Gamma T_0 \cap T_\rho$, and $\underline{b} \in \Gamma N'_\sigma$ such that $\beta\underline{b}$ is a section of T_0 — indeterminacy in [d2] $\Gamma T_0 \cap N'_\sigma$. The indeterminacy in $\underline{u}$ is right multiplication by a section of $T_0 \cap T_\rho \cap N'_\sigma$, so it will suffice that we have

$$(164) \qquad T_0 \cap T_\rho \cap N'_\sigma = \{1\}.$$

m1135

Marginal note. [m1135] in fact, we will even have $T_0 \cap T_\rho = \{1\}$ in the cases considered in II, III and following|sequel...

Assuming this relation satisfied, what conditions to put on (α, β, f) to come from a system (152) — i.e. from a section of $\mathcal{M}_{\rho,\sigma}$?

[p. 458]

[scan 460]

We see that if a section [d1] φ_0 of $\mathcal{M}_{\rho,\sigma}$, [d2] [d3] corresponding to α_0, β_0, f_0, is replaced by $\varphi_1 \overset{\text{definition}}{=} f^{-1}.\varphi_0$, corresponding to α_1, β_1, f_1, then

$$(165) \qquad \alpha_1 = \alpha_0, \quad \beta_1 = \beta_0, \quad f_1 = f_0 f,$$

for we see that if φ_0 corresponds to $(\underline{U}_0, \underline{a}_0, \underline{b}_0)$, then φ_1 to $(U_1, \underline{a}_1, \underline{b}_1)$, then we have

$$(166) \qquad U_1 = f^{-1}U_0, \quad \underline{a}_1 = \underline{a}_0, \quad \underline{b}_1 = \underline{b}_0$$

(for $\Theta_G \mid SG =$ the canonical inclusion $SG \hookrightarrow G$, and $\Theta_\rho, \Theta_\sigma$ [i1] [d4] trivial on SG). [d5] Thus [d6i2] we will have

$$u_1 = u_0 \qquad (\text{for } \det U_1 = \det U_0)$$

whence (165). This shows that the conditions sought on (α, β, f) depend only on α, β, not on f. We would like them to be expressed by the validity of the loop formula(157)[i3], for a parameter ε,[i4] μ not specified ($\varepsilon^2 = 1$) (which will be then uniquely determined — and will allow the secondary definition of local notion|local action...).

m1136

Marginal note. [m1136] to tell the truth, this condition is not sufficient even in the cases considered — we will find therefore|in a $\underline{u} \in B'_0$, and we must require that $\underline{u} \in T_0$ (already for (α, β) to be "normalized") i.e. $B = 0$, where $B = ac + bd + bc$, if $\underline{u} = \left(\begin{smallmatrix} a & b \\ c & d \end{smallmatrix}\right)$ (modular case) cf. proposition page 412'... To have it R ; itself being additional condition, it|which is necessary to replace|is necessary to consider $\mathcal{M}_{\rho,\sigma}$ by the product $\frac{1}{2}$ direct by L_0, on which we set $f_\Delta = 0$, i.e. $S\mathcal{M}_{\rho,\sigma}$.

The sufficiency of this condition will be the subject of the reflections in (II) (III), under conditions (more draconian than those of the preceding proposition (page 531') which we have imposed on the triple $(\varepsilon_0, \rho, \sigma)$. It

is possible that the conditions at which we there[i1] arrived were more restrictive than necessary, and that I shall be obliged to come back to this later, in a context more general than that of forms of Gl(2), GP(1), Sl(2), but for the moment the detailed study made by taking our inspiration from the hypotheses brought out in [d1] II, III will have served to clear the ground for us, to clarify our ideas on an important particular case.

Remark. Let us recall that we have seen that in fact μ is already defined in terms of α alone, and even in terms of $\alpha\rho(\alpha)^{-1} = \xi$; [d2] But it is determined in terms of β — in fact, of $\beta\sigma(\beta)^{-1}$ — only modulo knowledge of ε (in practice, modulo sign…). But if we impose (for example) $\varepsilon = 1$, the datum of α determines β only modulo [d3] $\beta \longrightarrow \beta T_\sigma$…

The structure of $\mathcal{M}_{\rho,\sigma}$ being well understood, let us return to the group $S\mathcal{M}_{\rho,\sigma}$(cf. page 495')[i1], considered as the semidirect product of $\mathcal{M}_{\rho,\sigma}$ by the subgroup L_0 of SG, on which $\mathcal{M}_{\rho,\sigma}$ in fact operates via χ. Denoting by
(165)

$$\mathcal{E}|\varepsilon_{L_0} : G_a \xrightarrow{\sim} \mathrm{Ker}(S\mathcal{M}_{\rho,\sigma} \longrightarrow \mathcal{M}_{\rho,\sigma})$$

corresponding to ε_0,[i3] we will have by [d2] construction

$$(166) \qquad U(\mathcal{E}|\varepsilon_{L_0}(\lambda)) = \mathcal{E}|\varepsilon_{L_0}(\mu\lambda) \qquad \text{where } \mu = \chi(U).$$

[d3]

[p. 534]

[d1] § The subgroups $\mathcal{M}_{\rho,\sigma}(0)$, [d2] $\mathcal{M}_{\rho,\sigma}[0]$, and the group[i1] $S\mathcal{M}_{\rho,\sigma}$, the isomorphism

$$S\mathcal{M}_{\rho,\sigma} \xrightarrow{\sim} \Sigma^+_{\rho,\sigma}$$

The group $\mathcal{M}_{\rho,\sigma}$ is an extension of $\mathcal{T}_{\rho,\sigma}$ by $\widetilde{G}|\widetilde{\mathcal{C}}^+_{\rho,\sigma} \simeq SG$, and the three subgroups which we are going to make explicit will be [d3]subgroups|subgroups[i2], [d4] with the grain of salt that for the third, it will be a partial section only, over the subgroup $\mathcal{T}'_{\rho,\sigma}$[i3] of index 2 in $\mathcal{T}_{\rho,\sigma}$, kernel of ε_3.

⟦Let us determine in a general way the sections of $\mathcal{M}_{\rho,\sigma}$ over $\mathcal{T}_{\rho,\sigma}$. Since we have
(1)

$$\begin{array}{ccc} R_{\rho,\sigma} & \longrightarrow & \mathcal{T}_{\rho,\sigma} \quad \text{epimorphism with kernel } \mu_2 \\ \wr| \simeq & & \\ S'T_\rho \times SN'_\sigma \times G_m & & \end{array}$$

it comes to the same to give oneself a section, or: a homomorphism
(2)

$$R_{\rho,\sigma} \xrightarrow{\psi} \mathcal{M}_{\rho,\sigma}$$

which is [d6]

$$(3) \qquad \begin{cases} \text{a)} & \text{trivial on } \mu_2 \\ \text{b)} & \text{“lifts” (1)} \end{cases}$$

The homomorphisms $\Xi|\Sigma$ satisfying (3) correspond to the splittings of the trivial extension of $R_{\rho,\sigma}$ by SG (product extension), hence simply to the homomorphisms
(4)

$$R_{\rho,\sigma} \xrightarrow{\psi^0} SG$$

,
[p. 462]

in the end this won't be of much use...

terms of the canonical realization

$$\mathcal{M}_{\rho,\sigma} \simeq \underbrace{R_{\rho,\sigma} \times SG}_{\widetilde{\mathcal{M}}_{\rho,\sigma}} / \underset{\text{diagonal}}{\mu_2} \tag{9}$$

and of the homomorphism m1140

Marginal note. m1140

$$\kappa : R_{\rho,\sigma} \longrightarrow \mathbf{G}_m$$

the canonical homomorphism making it possible to express $\Theta|R_{\rho,\sigma}$

$$(10) \qquad i_{T_0} : \mathbf{G}_m \xrightarrow{\sim} T_0 \hookrightarrow G$$

isomorphism|homomorphism inverse to the isomorphism

$$\delta_{T_0} = \det|T_0 : \quad T_0 \xrightarrow{\sim} \mathbf{G}_m,$$

we have, for an element

$$\begin{matrix} (\underline{r}, & U_0) \\ \wedge & \wedge \\ R_{\rho,\sigma} & SG \end{matrix}$$

of $\Gamma\widetilde{\mathcal{M}}_{\rho,\sigma}$

$$\Theta(\underline{r}, U_0) = \kappa(\underline{r})U_0, \quad \text{determinant } \kappa(r)^2$$

to say that this is $\in U$ therefore means we have

$$\kappa(\underline{r})U_0 = i_{T_0}(\kappa(\underline{r})^2) \quad \text{i.e.}$$

$$(11) \qquad U_0 = \kappa(\underline{r})^{-1} i_{T_0}(\kappa(\underline{r})^2)$$

so the inverse image $\widetilde{\mathcal{M}}^{(0)}_{\rho,\sigma}$ of $\mathcal{M}^{(0)}_{\rho,\sigma}$ in $\widetilde{\mathcal{M}}_{\rho,\sigma}$ consists of the

$$(12) \qquad (\underline{r}, \kappa(\underline{r})^{-1} i_{T_0}(\kappa(\underline{r}))^2) \in \Gamma\widetilde{\mathcal{M}}_{\rho,\sigma}$$

in other words this corresponds to a group section, with

$$(13) \qquad \psi^0_0(\underline{r}) = \kappa(\underline{r})^{-1} i_{T_0}(\kappa(\underline{r})^2).$$

As it should be, we do indeed have here a homomorphism

$$\psi^0_0 : R_{\rho,\sigma} \longrightarrow SG$$

and its value on μ_2 is the identity, for $\kappa(\underline{r})^2 = 1$ and we have

$$\psi^0_0(r) = \kappa(\underline{r})^{-1} = \begin{matrix} \kappa(\underline{r}) \\ \| \\ \underline{r} \end{matrix}$$

Remark [d2] To define this section, it sufficed

(from the point of view of pure calculation) to give oneself an arbitrary homomorphism, denoted $i'_{T_0}|i_{T_0}$, from $\mathbf{G}_m$ to SG, and to set (13).

Before leaving $\mathcal{M}^{(0)}_{\rho,\sigma}$, I am going to introduce the slightly larger group (of dimension 4, instead of 3)

$$\mathcal{M}^{[0]}_{\rho,\sigma} \overset{\text{dfn}}{=} \Theta^{-1}(B'_0) \tag{14}$$

where, let us recall, B'_0 is defined as the $\frac{1}{2}$ direct product

$$B'_0 = T_0.L_0 \tag{15}$$

This time, $U = U_0\kappa(r) \in \Gamma B'_0$ is not determined by knowledge alone of its determinant $2^{i2}\ \underline{\kappa}(r)^2$, which determines it only modulo L_0. This corresponds to the fact that $\mathcal{M}^{[0]}_{\rho,\sigma} \cap \overbrace{\overbrace{G|\mathcal{C}}^{SG}{}^{+}_{\rho,\sigma}}^{=B'_0\cap SG}$ is no longer reduced to (1), but to L_0, which therefore appears as an invariant subgroup of $\mathcal{M}^{[0]}_{\rho,\sigma}$, and we obviously will have|have (taking into account that $\mathcal{M}^{(0)}_{\rho,\sigma} \subset \mathcal{M}^{[0]}_{\rho,\sigma}$ and

$$\mathcal{M}^{(0)}_{\rho,\sigma} \xrightarrow{\sim} \mathcal{T}_{\rho,\sigma}$$

) by|that

$$\mathcal{M}^{[0]}_{\rho,\sigma} = \mathcal{M}^{(0)}_{\rho,\sigma}.L_0 \qquad \text{product } \frac{1}{2} \text{ direct} \tag{16}$$

This is again a construction which makes sense as soon as we have a T_0 as above, ^{d1} and a subgroup ^{d2} L_0 of SG,

[p. 536]

invariant under T_0. [d1]

The operation of $\mathcal{M}^{[0]}_{\rho,\sigma}$ on SG takes place through Θ, only recently regarded as an epimorphism

$$\mathcal{M}^{[0]}_{\rho,\sigma} \xrightarrow{\Theta|\mathcal{M}^{[0]}_{\rho,\sigma}} B'_0$$

; this operation being specified, we can introduce [m1141]

Marginal note. [m1141] for a more transparent definition, cf. pages 538', 539

$$(17) \qquad S\mathcal{M}_{\rho,\sigma} \overset{\text{definition}}{=} \begin{matrix} \mathcal{M}^{[0]}_{\rho,\sigma}.SG \\ \text{product } \frac{1}{2} \text{ direct} \end{matrix}$$

in which SG is invariant, and $\mathcal{M}^{[0]}_{\rho,\sigma}$ is identified with a subgroup of $S\mathcal{M}_{\rho,\sigma}$. Since $\mathcal{M}^{(0)}_{\rho,\sigma} \subset \mathcal{M}^{[0]}_{\rho,\sigma}$, we have a canonical inclusion

$$(18) \qquad \underbrace{\mathcal{M}^{(0)}_{\rho,\sigma} : SG}_{\simeq \mathcal{M}_{\rho,\sigma}} \subset \underbrace{\mathcal{M}^{[0]}_{\rho,\sigma}.SG}_{= S\mathcal{M}_{\rho,\sigma}}$$

whose image is [d3] identified with $\mathcal{M}_{\rho,\sigma}$. [d4]

[d5] I am beginning again to get lost in it, I am going to hang on — for an understanding of the "geometric" meaning of $S\mathcal{M}_{\rho,\sigma}$, $\mathcal{M}^{[0]}_{\rho,\sigma}$, to the notations of page 529, which deserves to be made explicit|made explicit by a

[scan 468]

Proposition Let us consider the homomorphism

$$(19)\quad \mathcal{M}_{\rho,\sigma} \longrightarrow G \times T_\rho \times N'_\sigma \times \mathbf{G}_m \times \mu_2^2|\mu_2$$

$$x \longmapsto (\Theta_G(x), \Theta_\rho(x), \Theta_\sigma(x), \chi(x), \varepsilon_2(x), \varepsilon_3(x))$$

This is a monomorphism, whose image consists of the [d2]systems[i1] $(\underline{U}, \underline{a}, \underline{b}, \mu, \varepsilon, \varepsilon')$ satisfying

$$(20)\qquad \begin{cases} \mu = \delta_G(\underline{U}) = \delta_\sigma(\underline{b}) = \varepsilon' \delta_\rho(\underline{a}) \\ \varepsilon = \varepsilon_\sigma(\underline{b}) \end{cases}$$

Corollary. The morphism.

$$(21)\quad \left| \begin{array}{ccc} \mathcal{M}_{\rho,\sigma} & \longrightarrow & G \times T_\rho \times N'_\sigma \\ x & \longmapsto & \Theta_G(x), \Theta_\rho(x), \Theta_\sigma(x) \end{array} \right.$$

is a monomorphism, the image consists of the triples $(\underline{U}, \underline{a}, \underline{b})$ satisfying [m1142]

Marginal note. [m1142] N.B. we have $\begin{cases} \varepsilon = \varepsilon_\sigma(\underline{b}) \\ \varepsilon' = \delta_\rho(\underline{a})/\delta_\sigma(\underline{b}) \\ \mu = \delta_\sigma(\underline{b}) = \delta_G(\underline{U}) \end{cases}$

$$(22)\qquad \begin{cases} \delta_G(\underline{U}) = \delta_\sigma(\underline{b}), \\ [\delta_\rho(\underline{a})/\delta_\sigma(\underline{b})]^2 = 1. \end{cases}$$

Proof of the proposition. We have [d4]

$$\mathrm{Ker}(\Theta_G, , \varepsilon_2, \varepsilon_3) = SR^{\circ|0}_{\rho,\sigma} \simeq ST_\rho \times ST_\sigma$$

and $\Theta_\rho, \Theta_\sigma$ [d6] on $SR^{\circ|0}_{\rho,\sigma}$ are identified with the two projections, hence [d7]

$$\mathrm{Ker}((\Theta_\rho, \Theta_\sigma)|SR^{\circ|0}_{\rho,\sigma}) = \{1\}, \quad \text{hence}$$

$$\mathrm{Ker}(\Theta_G, \chi, \varepsilon_2, \varepsilon_3, \Theta_\rho, \Theta_\sigma) = (1),$$

[p. 537]

hence a monomorphism. For the epimorphism, we are reduced to the equivalent form of the Corollary. — We may assume that we have a λ such that

$$\lambda^2 = \mu \overset{\text{dfn}}{=} \det \underline{U}$$

we want to write

$$\underline{U} = \Theta_{\widetilde{\mathcal{M}}}\begin{pmatrix} r & , & U_0 \\ \cup & & \cup \\ R_{\rho\sigma} & & SG \end{pmatrix} = \kappa(r)U_0$$

m1143

Marginal note. m1143 N.B. $\Theta_{\widetilde{\mathcal{M}}}$ the canonical homomorphism

$$\widetilde{\mathcal{M}}_{\rho,\sigma} \overset{\text{dfn}}{=} R_{\rho,\sigma} \times SG \longrightarrow G$$

which I had|wrote|write Θ_G.

with $U_0 \in \Gamma(SG)$, i.e. $\kappa(r)^2 = \det \underline{U}$ i.e. $\kappa(r)^2 = \mu$, we shall take r with d1

$$\kappa(r) = \lambda,$$

d2 we therefore put

$$\underline{U}_0 = \lambda^{-1}U, \quad \underline{a}_0 = \lambda^{-1}\underline{a}, \quad \underline{b}_0 = \lambda^{-1}b$$

d3 and we are[i1] reduced to seeing that $\underline{U}_0, \underline{a}_0, \underline{b}_0$ are in the image of $\mathcal{M}_{\rho,\sigma}$ (in being|removing "corrected ones" $(\underline{U}, \underline{a}, \underline{b})$ by the image d4 $G \times T_\rho \times T_\sigma$ of the section λ of $G_m \hookrightarrow R_{\rho,\sigma}$). We are reduced to seeing that $(\underline{a}_0, \underline{b}_0)$ is in the image of

$$R_{\rho,\sigma} \longrightarrow T_\rho \times N'_\sigma.$$

But now $\underline{a}_0$ is in $S'T_\rho$, $\underline{b}_0$ in SN'_σ, and precisely $R_{\rho,\sigma} \simeq S'T_\rho \times SN'_\sigma$, we have won...

Remark. We cannot replace G by PG, i.e.

$$\mathcal{M}_{\rho,\sigma} \longrightarrow PG \times T_\rho \times N'_\sigma$$

(where we can still add $G_m \times \mu_2 \times \mu_2$ if we want!) is not a monomorphism — its kernel is precisely the subgroup μ_2 of $\widetilde{G|\mathcal{C}}^+_{\rho,\sigma} = SG$.

[scan 470]

Let us consider, now that the quantities $\underline{U}, \underline{a}, \underline{b}$ (*and* $\mu, \varepsilon, \varepsilon'$) of page 529 (152) are understood, the quantities (153) of loc. cit. $\underline{u}, f, \alpha, \beta, \alpha_0, \beta_0$ (g, h ξ, η do not appear there, besides…) They are determined in terms of the $\underline{U}, \underline{a}, \underline{b}$, as soon as we know either $\underline{u}$ or f, by the formulas (154), $\underline{u}$ and f being related by the single relation

$$\underline{U} = f^{-1}\underline{u} \tag{23}$$

with in addition on f the condition

$$f \in \Gamma \underset{\widetilde{G|\mathcal{C}}^+_{\rho,\sigma}}{\overset{\sim}{SG}}, \tag{24}$$

plus a condition on u which, in loc. cit., was written

$$\underline{u} \in \Gamma T_0, \tag{25}$$

and was suggested by the calculations of §46 $\overline{\text{V}}$ (taken up again later in §48 $\overline{\text{II}}$, $\overline{\text{III}}$ etc). This condition ensures the uniqueness of $f, \underline{u}$ satisfying|satisfying (23) — that is, from the p^t of view of calculation, its main virtue! — but in certain contexts it is preferable to replace it by the more broad condition

$$\underline{u} \in \Gamma B'_0 \qquad \text{where} \quad \begin{array}{c} B'_0 = T_0.L_0. \\ (\text{product } \tfrac{1}{2} \text{ direct}) \end{array} \tag{26}$$

Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

[scan 471]

[p. 538]

We no longer have [d1] uniqueness for writing $\underline{U}$ in the form (23) — on the other hand we have an existence theorem in a simple form:

If we start with (α, β, f)[d2], sections of G such that

$$(\det \alpha)^2 = \det \beta = \det f = 1, \tag{27}$$

for [d3] this triple[i1] and as a result|consequence the quantities deduced from it: [d4] [d5]

$$\begin{cases} \alpha_0 = f^{-1}\alpha, & \beta_0 = f^{-1}\varepsilon\beta \\ \xi = \alpha\rho(\alpha)^{-1}, & \eta' = \beta\sigma(\beta)^{-1} \\ g = \alpha_0\rho(\alpha_0)^{-1}, & h = \beta_0\sigma(\beta_0)^{-1} \end{cases} \tag{28}$$

to come from a system $(x, \underline{u})$, with $x \in \Gamma\mathcal{M}_{\rho,\sigma}$, $\underline{u} \in \Gamma B_0'$ such that

$$f \overset{\text{dfn}}{=} \underline{u}\,\underline{U}^{-1} \in \Gamma SG, \quad \text{i.e.} \quad \det \underline{u} = \det \underline{U}, \tag{29}$$

by the formulas

$$\alpha = \underline{u}\,\underline{a}^{-1}, \quad \beta = \underline{u}\,\underline{b}^{-1}, \quad f = \underline{u}\,\underline{U}^{-1}, \tag{30}$$

it is necessary and sufficient that we have the relation (which does not involve f, only α, β):

$$\alpha\rho(\alpha)^{-1} = \varepsilon\beta\sigma(\beta)^{-1}\varepsilon_1(\mu - 1) \qquad \begin{array}{c} \text{for : } \varepsilon \in \Gamma\mu_2 \\ \mu \in \Gamma G_m \\ \text{suitable.} \end{array} \tag{31}$$

(N.B. $\varepsilon|\varepsilon_1, \mu$ are uniquely determined (thus in terms of α β). Then the pair $(x, \underline{u})$ is unique. For $f = 1$, (i.e. $\underline{u} = \underline{U}$),[i6] We can say [d11] also that we have a 1-1 correspondence between the the set [d12] sections of the|of the[i7] subgroups|subgroup $\mathcal{M}_{\rho,\sigma}[0]$ (not $\mathcal{M}_{\rho,\sigma}(0)$!) of $\mathcal{M}_{\rho,\sigma}$, and the set

[scan 472]

of pairs α, β satisfying the two relations

$$(\det \alpha)^2 = \det \beta = 1 \qquad \text{of (27)}$$

and the loop relation. For this, we have [d1] no use for the group $S\mathcal{M}_{\rho,\sigma}$.

But returning to the case of arbitrary f, to interpret the algebraic sheaf on the triples (α, β, f), satisfying (27)(31),[i1] with the structure of[i2] a strange group on it via cocycle relation,[i3] (to which I shall have to return in more[i4] geometric terms…) and because the three quantities α, β, f mix

intimately — there is reason to introduce $S\mathcal{M}_{\rho,\sigma}$ — which will be isomorphic to the|to scheme (in groups) of the common solutions of (27)(31).

From this point of view, $S\mathcal{M}_{\rho,\sigma}$ is derived from ρ as [d2] scheme[i5] [d3]

$$S\mathcal{M}_{\rho,\sigma} = \text{scheme of triples } (x, \underline{u}, f) \quad \text{with} \begin{cases} x \text{ in } \mathcal{M}_{\rho,\sigma}, \\ \underline{u} \text{ in } B'_0 \\ f \text{ in } SG \end{cases} \quad \begin{cases} \underline{U} = f^{-1}\underline{u} \\ \| \text{ definition} \\ \Theta_G(x) \end{cases} \tag{32}$$

Thus

$$(33) \quad S\mathcal{M}_{\rho,\sigma} \hookrightarrow \mathcal{M}_{\rho,\sigma} \times B'_0 \quad \leftarrow$$

$$\wr|$$

$$\left\{ x, \underline{u} \;\middle|\; \chi|\gamma(x) = \underbrace{\delta_G(\underline{u})}_{\| \text{ dfn}} \det \underline{u} \right\}$$

or again, more simply

Scans 473–491

[scan 473]

[p. 539]

$$\left\{\begin{array}{l} S\mathcal{M}_{\rho,\sigma} \xrightarrow{\sim} \mathcal{M}_{\rho,\sigma} \underset{\mathbb{G}_m}{\times} B'_0 \\ \\ \text{where} \quad \left\{\begin{array}{l} \mathcal{M}_{\rho,\sigma} \xrightarrow{\chi} \mathbb{G}_m \\ \\ B'_0 \xrightarrow{\delta_{B'_0}=\delta_G|B'_0} \mathbb{G}_m \end{array}\right. \end{array}\right. \quad , \quad \text{Whew !} \tag{34}$$

This formula will serve us as the definition of $S\mathcal{M}_{\rho,\sigma}$ from now on – it defines at once a group law on $S\mathcal{M}_{\rho,\sigma}$, and we find on $S\mathcal{M}_{\rho,\sigma}$ two extension structures

$$\begin{array}{ccccccccc} 1 & \longrightarrow & L_0 & \longrightarrow & S\mathcal{M}_{\rho,\sigma} & \longrightarrow & \mathcal{M}_{\rho,\sigma} & \to & 1\,, \\ & & \| & & & & & & \\ & & \mathrm{Ker}(B'_0 \xrightarrow{\delta_{B'_0}} \mathbb{G}_m) & & \tilde{x} = (x, \underline{u}|y) & \longmapsto & x & & \end{array} \tag{35}$$

$$\begin{array}{ccccccccc} 1 & \longrightarrow & \mathcal{M}^+_{\rho,\sigma} & \longrightarrow & S\mathcal{M}_{\rho,\sigma} & \to & B'_0 & \to & 1 \\ & & \| & & & & & & \\ & & \mathrm{Ker}(\mathcal{M}_{\rho,\sigma} \xrightarrow{\chi} \mathbb{G}_m) & & \begin{array}{c}\tilde{x} \\ \| \\ (x, \underline{u})\end{array} & \longmapsto & \underline{u} & & \end{array} \tag{36}$$

The subgroup $S\mathcal{M}_{\rho,\sigma}[0]$ of $S\mathcal{M}_{\rho,\sigma}$ corresponds to the condition $f = 1$ i.e. $\begin{array}{c}\underline{U} \\ \| \\ \Theta_G(x)\end{array} = \underline{u}$ (which already implies $\begin{array}{c}\det \underline{U} \\ \| \\ \chi(x)\end{array} = \det \underline{u}$ – it is also the subgroup of the (x, u) in $\mathcal{M}_{\rho,\sigma} \times B'_0$ such that we have $u = \Theta_G(x)$. Thus $S\mathcal{M}_{\rho,\sigma}[0]$ is the subgroup of $S\mathcal{M}_{\rho,\sigma}$ which is the isomorphic[i1] image of $\mathcal{M}_{\rho,\sigma}[0]$ [d1] [d2] (cf. (14|19) page 536')[i2] under $x \longmapsto (x, \Theta_G(x))$:

$$S\mathcal{M}_{\rho,\sigma}[0] = \mathrm{Im}\left(\begin{array}{ccc} \mathcal{M}_{\rho,\sigma}[0] & \hookrightarrow & S\mathcal{M}_{\rho,\sigma} \\ \\ x & \longmapsto & (x, \Theta_G(x)) \end{array}\right) \tag{37}$$

$$(\text{where} \quad \mathcal{M}_{\rho,\sigma}[0] = \Theta_G^{-1}(B'_0) \quad)$$

[scan 474]

Giving a splitting of (35) amounts to a splitting of

$$1 \longrightarrow L_0 \longrightarrow B_0' \longrightarrow \mathbb{G}_m \longrightarrow 1\,,$$

now there is one ready-made via the subgroup T_0. So we deduce from this an embedding of $\mathcal{M}_{\rho,\sigma}$ into $S\mathcal{M}_{\rho,\sigma}$, which thereby does indeed become a 1/2-direct product.

$$S\mathcal{M}_{\rho,\sigma} \simeq \mathcal{M}_{\rho,\sigma} \cdot L_0 \tag{38}$$

$\mathcal{M}_{\rho,\sigma}$ operating moreover on L_0 via the character $\chi : \mathcal{M}_{\rho,\sigma} \longrightarrow \mathbb{G}_m$ – but this description now seems to me much less "telling" than (34), for it does not bring out the canonical homomorphism

$$S\mathcal{M}_{\rho,\sigma} \longrightarrow B_0'$$

which is nevertheless the essential thing for the introduction of $S\mathcal{M}_{\rho,\sigma}$. Once this is in place, we find ("for the record") the

Theorem We have a canonical isomorphism

$$S\mathcal{M}_{\rho,\sigma} \longrightarrow S\Sigma^*_{\rho,\sigma} \qquad \begin{array}{c}\text{group}\\ \text{scheme of the}\\ \text{systems } (\alpha,\beta,f)\\ \text{satisfying (17)}\\ \text{and (31)}\end{array} \tag{39}$$

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 475]

[p. 540]

given by :

$$(x, \underline{u}) \longmapsto (\alpha, \beta, f) \quad \text{with} \quad \alpha = \underline{ua}^{-1}, \quad \beta = \underline{ub}^{-1}, \quad f = \underline{uU}^{-1} \qquad \text{(how beautiful it is !)} \qquad (40)$$
$$\text{where} \quad \underline{a} = \Theta_\rho(x), \quad \underline{b} = \Theta_\sigma(x), \quad \underline{U} = \Theta_G(x)$$

[d1]The operation of L_0[i1] on $\Sigma_{\rho,\sigma}$ by

$$(\alpha, \beta, f) \longrightarrow ''|(\ell\alpha, \ell\beta, \ell f \qquad (41)$$

corresponds to the operation of left[i2] translation by the subgroup L_0 of $S\mathcal{M}_{\rho,\sigma}$ (cf. (35)), consisting of the $(1, \ell)$ with ℓ in L_0, so we recover $\mathcal{M}_{\rho,\sigma} \simeq S\mathcal{M}_{\rho,\sigma}/L_0$ as the quotient (group)[i3] scheme of $S\Sigma^*_{\rho,\sigma}$ by the action (41) of L_0.

Remark In this description of the (α, β, f) the new quantities $\underline{u}$, $\underline{a}$, $\underline{b}$, $\underline{U}$ occur, which leads to considering the morphism

$$\begin{cases} S\mathcal{M}_{\rho,\sigma} \longrightarrow B'_0 \times T_\rho \times N'_\sigma \times G \\ (x, \underline{u}) \longmapsto (\underline{u}, \underline{a}, \underline{b}, \underline{U}) \end{cases} \quad \text{with} \quad \begin{array}{l} \underline{a} = \Theta_\rho(x) \\ \underline{b} = \Theta_\sigma(x) \\ \underline{U} = \Theta_G(x) \end{array} \qquad (42)$$

We have in this connection :

Proposition The homomorphism (42) is a monomorphism, its image consists of the systems satisfying

$$\det \underline{u} = \det \underline{b} = \det \underline{U} \quad \text{i.e. } \mu, \quad \text{and} \quad \det \underline{a}/\mu \in \Gamma\mu_2 \qquad (43)$$

This is an immediate consequence of the corollary to the proposition on page 536', and of the definition of $S\mathcal{M}_{\rho,\sigma}$ as a fiber product.

10°) The section-subgroups $\mathcal{M}_{\rho,\sigma}(\sigma)$, $\mathcal{M}_{\rho,\sigma}(\rho)$.

We define $\mathcal{M}_{\rho,\sigma}(\sigma)$ by the condition

$$\beta_0 = 1 \quad \text{i.e.} \quad \beta = f \quad \text{i.e. cf. (40))}$$

$$\underline{U} = \underline{b} \tag{43}$$

It is evident from the proposition on page 536' that the subgroup

$$\begin{gathered} \mathcal{M}_{\rho,\sigma}(\sigma) \subset \mathcal{M}_{\rho,\sigma}) \\ \| \text{ df} \\ \{(\underline{a},\underline{b},\underline{U}) \in \Gamma\mathcal{M}_{\rho,\sigma} \mid U = \underline{b}\} \end{gathered} \tag{44}$$

provides a section – when $\underline{a},\underline{b}$ is given in $\mathcal{T}_{\rho,\sigma}$[i1], i.e.[i2] satisfying the condition

$$\delta_\rho(\underline{a})/\delta_\sigma(\underline{b}) \in \Gamma\mu_2,$$

and the simplest way of lifting it to an element $(\underline{a},\underline{b},\underline{U})$[i3] of $\mathcal{M}_{\rho,\sigma}$ isn't it by $(\underline{a},\underline{b},\underline{U}\,\text{df} = \underline{b})$! (And we will have indeed $\delta_G(\underline{U}) = \delta_\sigma(\underline{b})$.). We likewise define $\mathcal{M}_{\rho,\sigma}(\rho)$ by $\alpha_0 = 1$ i.e. $\alpha = f$ i.e.

$$\begin{gathered} \mathcal{M}_{\rho,\sigma}(\rho) \subset \mathcal{M}_{\rho,\sigma} \\ \| \\ \{(\underline{a},\underline{b},\underline{U}) \text{ in } \mathcal{M}_{\rho,\sigma} \mid \underline{U} = \underline{a}\} \end{gathered} \tag{45}$$

which gives a partial section over[i4] the subgroup $\mathcal{T}'_{\rho,\sigma}$ of $\mathcal{T}_{\rho,\sigma}$ defined as

$$\begin{gathered} \mathcal{T}'_{\rho,\sigma} \in \mid \subset \mathcal{T}_{\rho,\sigma} \\ \| \text{ df} \\ ((\underline{a},\underline{b}) \in T_\rho \times N'_\sigma \mid \delta_\rho(\underline{a}) = \delta_{\sigma|\rho}(\underline{b})) \\ \| \\ \text{Ker}(\mathcal{T}_{\rho,\sigma} \xrightarrow{\epsilon_3} \mu_2) \end{gathered} \tag{46}$$

so

$$\mathcal{T}'_{\rho,\sigma} = T_\rho \times_{\mathbb{G}_m} N'_\sigma, \quad \text{and we have} \tag{47}$$

XII Retrospective

After many unnecessarily complicated detours, I ended up quite simply constructing two group schemes over $\mathbb{Z}$

$$\mathcal{M}_{\rho,\sigma} \subset T_\rho \times N'_\sigma \times G \tag{1}$$

$$S\mathcal{M}_{\rho,\sigma} \subset B'_0 \times T_\rho \times N'_\sigma \times \dagger G \tag{2}$$

by

$$\mathcal{M}_{\rho,\sigma} = \left\{ \overbrace{(\dagger\underline{a}, \dagger\underline{b}, \dagger\underline{U})}^{x} \;\middle|\; \overbrace{\det \underline{U} = \det \underline{b}}^{\chi(x)} = \overset{\varepsilon_3(x)}{\varepsilon'} \det \underline{a}, \varepsilon'^2 = 1 \right\} \tag{3}$$

$$S\mathcal{M}_{\rho,\sigma} = \left\{ (\underline{u}, \underline{a}, \underline{b}, \underline{U}) \;\middle|\; \det \underline{U} = \det \underline{u} = \det \underline{b} = \varepsilon' \det \underline{a},\ \varepsilon'^2 = 1 \right\} \tag{4}$$

with

$$\mathcal{M}_{\rho,\sigma} \simeq S\mathcal{M}_{\rho,\sigma}/L_0 \tag{5}$$

thus $S\mathcal{M}_{\rho,\sigma} = B'_0 \times_{\mathbb{G}_m} \mathcal{M}_{\rho,\sigma}$

where

$$L_0 \hookrightarrow S\mathcal{M}_{\rho,\sigma}$$

$$\lambda \longmapsto (1, 1, 1, \lambda)$$

and

$$S\mathcal{M}_{\rho,\sigma} \simeq \underset{\frac{1}{2}\text{-direct product}}{\mathcal{M}_{\rho,\sigma} \,.\, L_0} \tag{6}$$

where

$$\begin{cases} \mathcal{M}_{\rho,\sigma} \hookrightarrow S\mathcal{M}_{\rho,\sigma} \\ \\ x = (\underline{U}, \underline{a}, \underline{b}) \longmapsto (\underline{U}, \underline{a}, \underline{b}, i_{T_0}(\dagger\mu)) \end{cases} \qquad \text{where } \mu = \chi(x). \tag{7}$$

Here (for reference) in the modular case

$$\rho = \begin{pmatrix} 0 & 1 \\ -1 & 1 \end{pmatrix} \qquad \sigma = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} \tag{8}$$

$$\begin{cases} T_\rho = \left\{ (c\rho + d) \,\middle|\, \underbrace{\det(c\rho+d)}_{c^2+cd+d^2} \text{ inv.} \right\} \\ T'_\sigma = \left\{ (t\sigma + u) \,\middle|\, \underbrace{\det(t\sigma+u)}_{t^2+u^2} \text{ inv.} \right\}. \end{cases} \tag{9}$$

m1146

Marginal note. m1146

$$\begin{cases} B'_0 = \left\{ \begin{pmatrix} \mu & \lambda \\ 0 & 1 \end{pmatrix} \middle| \, \mu \text{ inv.} \right\} \\ T_0 = \left\{ \begin{pmatrix} \mu & 0 \\ 0 & 1 \end{pmatrix} \middle| \, \mu \text{ inv.} \right\} \\ i_{T_0}(\mu) = \begin{pmatrix} \mu & 0 \\ 0 & 1 \end{pmatrix} \\ L_0 = \left\{ \begin{pmatrix} 1 & \lambda \\ 0 & 1 \end{pmatrix} \right\} \end{cases}$$

d8

$$N'_\sigma = \left\{ \underline{b} \text{ in } G \,\middle|\, \underline{b}(\sigma) = \underset{\varepsilon_\sigma(\underline{b})}{\varepsilon} \sigma,\ \varepsilon^2 = 1 \right\}, \tag{10}$$

whence exact sequence

$$1 \longrightarrow T_\sigma \longrightarrow N'_\sigma \xrightarrow{\varepsilon_\sigma} \mu_2 \longrightarrow 1\ , \tag{11}$$

and the three homomorphisms

$$\mathcal{M}_{\rho,\sigma} \xrightarrow{\Theta_G} G\ , \qquad \mathcal{M}_{\rho,\sigma} \xrightarrow{\Theta_\rho} T_\rho\ , \qquad \mathcal{M}_{\rho,\sigma} \xrightarrow{\Theta_\sigma} N'_\sigma \tag{12}$$

given in the definition (1)(3) are completed by

$$\mathcal{M}_{\rho,\sigma} \xrightarrow{\chi=\det\circ\Theta_G} \mathbb{G}_m\ , \qquad \mathcal{M}_{\rho,\sigma} \xrightarrow{\varepsilon_2=\varepsilon_\sigma\circ\Theta_\sigma} \mu_2\ , \qquad \mathcal{M}_{\rho,\sigma} \xrightarrow{\varepsilon_3(x)=\frac{\det a}{\det b}} \mu_2 \tag{12 bis}$$

so that we find

$$\begin{aligned} \mathcal{M}_{\rho,\sigma} &\overset{(\Theta_G,\Theta_\rho,\Theta_\sigma,\chi,\varepsilon_2,\varepsilon_3)}{\hookrightarrow} G\times T_\rho\times N'_\sigma\times\mathbb{G}_m\times\mu_2\times\mu_2 \\ x &\longmapsto (\underline{U},\underline{a},\underline{b},\mu,\varepsilon,\varepsilon') \end{aligned} \tag{13}$$

whose image consists of the systems satisfying

$$\begin{cases} \det\underline{U}=\det\underline{b}=\varepsilon'\det\underline{a}=\mu \\ \varepsilon=\varepsilon_\sigma(\underline{b}) \quad \text{i.e} \quad \underbrace{\sigma(\underline{b})}_{{}^t\underline{b}^{-1}}=\varepsilon\underline{b} \quad \text{i.e} \quad \underline{b}\,{}^t\underline{b}=\varepsilon \end{cases} \qquad \underline{b}(\sigma)=\varepsilon\sigma \quad \text{i.e.} \tag{14}$$

Likewise we have a monomorphism

$$\begin{aligned} S\mathcal{M}_{\rho,\sigma} &\hookrightarrow B'_0\times T_\sigma\times N'_\sigma\times\dagger\underline{G}\times\mathbb{G}_m\times\mu_2\times\mu_2 \\ x &\longmapsto (\underline{u},\underline{a},\underline{b},\underline{U},\mu,\varepsilon,\varepsilon') \end{aligned} \tag{15}$$

whose image consists of the systems satisfying

$$\begin{cases} \mu=\det\underline{u}=\det\underline{U}=\det\underline{b}=\varepsilon'\det\underline{a} \\ \varepsilon=\varepsilon_\sigma(\underline{b}) \quad \text{i.e} \quad \underline{b}(\sigma)=\varepsilon(\sigma) \end{cases} \tag{16}$$

Let [d2] on the other hand

$$\begin{aligned} S\Sigma^*_{\rho,\sigma} &\hookrightarrow G\times G\times G\times\mathbb{G}_a\times\mu_2 \\ &\| \\ \left\{ \underbrace{(\alpha,\beta,f,\mu,\varepsilon)}_{y} \,\middle|\, \begin{array}{c} (\det\alpha)^2=\det\beta=\det f=1 \\ \underbrace{\alpha\rho(\alpha)^{-1}}_{\xi}=\underbrace{\varepsilon\beta\sigma(\beta)^{-1}}_{\eta}\varepsilon_1(\mu-1) \end{array} \right\} \end{aligned} \tag{17}$$

(where we define

$$\varepsilon_1=\begin{pmatrix}1&0\\1&1\end{pmatrix}, \qquad \varepsilon_1(\nu)=\varepsilon_1^\nu \overset{\text{dfn}}{=} \begin{pmatrix}1&0\\\nu&1\end{pmatrix}.) \tag{18}$$

[scan 481]

[p. 543] in fact the projection

$$\begin{cases} S\Sigma^*_{\rho,\sigma} \hookrightarrow G \times G \times G \\ \\ y \longmapsto (\alpha, \beta, f) \end{cases} \tag{19}$$

is already a monomorphism. We let act d1 freely i1

$$L_0 = \mathrm{Ker}\left(B'_0 \xrightarrow{\det} \mathbb{G}_m \right) = \left\{ \begin{pmatrix} 1 & \lambda \\ 0 & 1 \end{pmatrix} \right\} \quad \text{on } S\Sigma^*_{\rho,\sigma}$$

by

$$(\alpha, \beta, f) \longmapsto (l\alpha, l\beta, lf) \ , \tag{20}$$

and we set

$$\Sigma^*_{\rho,\sigma} \overset{\text{dfn}}{=} L_0 \backslash S\Sigma^*_{\rho,\sigma}. \tag{21}$$

This being so, we have an isomorphism

$$\begin{gathered} S\mathcal{M}_{\rho,\sigma} \xrightarrow{\sim} S\Sigma^*_{\rho,\sigma} \\ (\underline{u}, \underline{a}, \underline{b}, \underline{U}) \longmapsto \begin{cases} (\alpha, \beta, f), \\ \alpha = \underline{u}\,\underline{a}^{-1}, \quad \beta = \underline{u}\,\underline{b}^{-1}, \quad f = \underline{u}\,\underline{U}^{-1} \end{cases} \end{gathered} \tag{22}$$

transforming the action of L_0 on $S\dagger\mathcal{M}_{\rho,\sigma}$ by translation on the left i2 into i3 the action of L_0 described in (20), and inducing an isomorphism

$$\mathcal{M}_{\rho,\sigma} \xrightarrow{\sim} \Sigma^*_{\rho,\sigma} \tag{23}$$

by passage to the quotient.

We have canonical homomorphisms

$$S_0\mathcal{M}^{\sim}_{0,3} \longrightarrow S\mathcal{M}_{\rho,\sigma}(\widehat{\mathbb{Z}})/\Sigma \tag{24}$$

$$\mathcal{M}^{\sim}_{0,3} \longrightarrow \mathcal{M}_{\rho,\sigma}(\widehat{\mathbb{Z}})/\Sigma \tag{25}$$

the second deduced from the first by passage to the quotient, and coinciding on $\mathcal{G}^{+\wedge}_{0,3}$ with d5 [p. 480]

[scan 482]

the composite homomorphism

$$\mathcal{G}^{+\wedge}_{0,3} \xrightarrow[\sim]{\S 42\ \overline{\text{IV}}} \begin{array}{c}\mathrm{Sl}(2,\widehat{\mathbb{Z}})' \\ \| \\ SG(\widehat{\mathbb{Z}})/SG(\widehat{\mathbb{Z}})\cap\Sigma\end{array} \hookrightarrow \mathcal{M}_{\rho,\sigma}(\widehat{\mathbb{Z}})/\Sigma \tag{26}$$

thanks to the canonical homomorphism

$$\begin{array}{ccc} SG & \hookrightarrow & \mathcal{M}_{\rho,\sigma} \\ \| & & \\ \mathrm{Sl}(2) & = & \left\{ (\underline{a},\underline{b},\underline{U}) \,\middle|\, \underline{a} \overset{\text{in } \mathcal{M}_{\rho,\sigma}}{=} \underline{b} = 1 \right\} \end{array} \tag{27}$$

We have defined[d3]

$$\Sigma = \begin{array}{c}(\mathbb{Z}/2\mathbb{Z})^3 \\ \| \\ (\mu_2)^3(\mathbb{Z})\end{array} \hookrightarrow \mathcal{M}_{\rho,\sigma}(\mathbb{Z}) \quad \subset \quad \mathcal{M}_{\rho,\sigma}(\widehat{\mathbb{Z}}) \tag{28}$$

via the canonical homomorphism (central)

$$\mu_2^3 \longrightarrow \mathcal{M}_{\rho,\sigma} \quad \subset \quad T_\rho \times N'_\sigma \times G \tag{29}$$

defined via the canonical composites

$$\mu_2 \hookrightarrow \mathbb{G}_m \hookrightarrow \begin{matrix} T_\rho \\ T_\sigma \\ G \end{matrix} \hookrightarrow N'_\sigma \ . \tag{30}$$

By passage to the quotient, the homomorphism (25) induces

$$\Gamma^{\sim}_{0,3} \longrightarrow \mathcal{T}_{\rho,\sigma}(\widehat{\mathbb{Z}}) / \underbrace{\{\pm 1\} \times \{\pm 1\}}_{\Sigma_0} \ , \tag{31|34}$$

where

$$\begin{array}{ccc} \mathcal{T}_{\rho,\sigma} & \hookrightarrow & T_\rho \times N'_\sigma \\ & \| & \\ \{(\underline{a}, \underline{b}) \mid \det \underline{a} / \det \underline{b} \in \Gamma\mu_2\} & & \end{array} \tag{32}$$

The giving — rather the construction made by us — of a [d6] group homomorphism (24) [p. 481]

[scan 483]

[p. 544]

amounts to the construction of the four group homomorphisms

$$S_0\mathcal{M}^{\sim}_{0,3} \xrightarrow{\text{giving } \underline{u} \ \Theta^{\pi}_{B'_0}} B'_0(\widehat{\mathbb{Z}}) = \widehat{\mathbb{Z}}^* \,.\, \widehat{\mathbb{Z}} \qquad (\tfrac{1}{2}\text{-direct product}) \tag{33}$$

$$\mathcal{M}^{\sim}_{0,3} \xrightarrow{\text{giving } \underline{U} \text{ (mod sign)} \ \Theta^{\pi}_{G}} G(\widehat{\mathbb{Z}}) / \pm 1 = \mathrm{Gl}(2, \widehat{\mathbb{Z}}) / \pm 1 \tag{34}$$

$$\Gamma^{\sim}_{0,3} \xrightarrow[\Theta^{\pi}_{\rho}]{\text{giving } \underline{a} \text{ (mod sign)}} T_\rho(\widehat{\mathbb{Z}})/\pm 1 \qquad \begin{matrix}(\text{adelic units}\\ (\text{mod } \pm 1) \text{ of the}\\ \text{field } \mathbb{Q}(j))\end{matrix} \tag{35}$$

$$\Gamma^{\sim}_{0,3} \xrightarrow[\Theta^{\pi}_{\sigma}]{\text{giving } \underline{b} \text{ (mod sign)}} T_\sigma(\widehat{\mathbb{Z}})/\pm 1 \qquad \begin{matrix}(\text{adelic units}\\ (\text{mod } \pm 1) \text{ of the}\\ \text{field } \mathbb{Q}(i))\end{matrix} \tag{36}$$

linked|unlinked by the relations (4), which we are going to identify. We use the subgroup

$$\begin{aligned}\mathcal{M}^{!\sim}_{0,3}[0]^{-} = {} & \text{subgroup of } \mathcal{M}^{!\sim}_{0,3} \text{ which}\\ & (\text{leaves invariant the classes of the loop subgroups}\\ & \text{of } \Pi^{\wedge}_{0,3}, \text{ and which})\\ & \text{normalizes } L_{0\pi} \text{ (closed subgroup}\\ & \text{generated by } l_0)\end{aligned} \tag{37}$$

and we note that

$$1 \longrightarrow L_{0\pi} \longrightarrow \mathcal{M}^{!\sim}_{0,3}[0] \longrightarrow \Gamma^{\sim}_{0,3} \longrightarrow 1 \tag{38}$$

and that

$$\begin{cases} \mathcal{M}^{\sim}_{0,3} = \mathcal{M}^{!\sim}_{0,3}[0] \,.\, \underbrace{\mathcal{G}^{+\wedge}_{0,3}}_{\substack{\text{invariant subgroup}\\ \text{of } \mathcal{M}^{\sim}_{0,3}}} \\ \text{with} \quad \mathcal{M}^{!\sim}_{0,3}[0] \cap \mathcal{G}^{+\wedge}_{0,3} = L_{0\pi} \end{cases} \tag{39}$$

— of course (38) is a consequence of (39).

finally

$$S_0\mathcal{M}^{\sim}_{0,3} \simeq \underbrace{\mathcal{M}^{!\sim}_{0,3}[0] \,.\, \mathcal{G}^{+\wedge}_{0,3}}_{(\frac{1}{2}\text{-direct product})} \tag{40}$$

1°) The homomorphism (33) from $S_0\mathcal{M}^{\sim}_{0,3}$ i3 d2 is trivial on the factor $\mathcal{G}^{+\wedge}_{0,3}$

[scan 484]

m1147

Marginal note. m1147 so the d1description i1 of (33) amounts to the description of the sole homomorphism|first homomorphism

$$\mathcal{M}^{\sim}_{0,3}[0] \longrightarrow B'_0(\widehat{\mathbb{Z}})$$

Its d2 value depends only on the pair (α, β) d3 of the triple (α, β, f) which describes an element of $\mathcal{M}^{\sim}_{0,3}$), and the d4 definition of $\underline{u}$ in terms of α, β — and even only in terms of the image of $\xi = \alpha\rho(\alpha)^{-1}$ in $\mathrm{Sl}(2, \widehat{\mathbb{Z}})$ d5 and even i2 only in $\mathrm{Sl}(2, \widehat{\mathbb{Z}})'$! — m1148

Marginal note. m1148 For one normalizes by the condition $\xi\rho(\xi)\rho^2(\xi) = \pm 1| + 1$!

to|has been made|made essentially in §45 or at least in §46 III, — we have

$$\underline{u} := \begin{pmatrix} 1/D & B/D \\ 0 & 1 \end{pmatrix} \qquad \text{where } \xi = \begin{pmatrix} A & B \\ C & D \end{pmatrix} \text{ (in } \mathrm{Sl}(2, \widehat{\mathbb{Z}})\text{)} \tag{41}$$

or again, in terms of

$$\underline{\alpha} = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \qquad \text{with } ad - bc = |\ \in \varepsilon' \in \{\pm 1\}$$

$$\begin{cases} \varepsilon' D = (c^2 + cd + d^2) \\ \varepsilon' B = ac + bd + bc \end{cases} \tag{42}$$

This does not depend on the foundations not laid for profinite groups — the "calculations in ξ, η" are in fact sufficient. It is thanks to the description of this homomorphism that one can define

$$\begin{array}{c} \mathcal{M}^{\sim}_{0,3}(0) \subset \mathcal{M}^{\sim}_{0,3}[0] \\ \| \\ \{\underline{u} \mid \underline{u} \in T_0(\widehat{\mathbb{Z}}) \quad \text{i.e. } B = 0\} \\ \text{i.e. } ac + bd + bc = 0 \end{array} \tag{43}$$

(normalization condition),

[scan 485]

[p. 545]

and obtain canonical decompositions into $\frac{1}{2}$-direct|direct products

$$\mathcal{M}^{\sim}_{0,3}[0] \simeq \mathcal{M}^{\sim}_{0,3}(0) \,.\, L_{0\pi} \tag{44}$$

$$\mathcal{M}^{\sim}_{0,3} \simeq \mathcal{M}^{\sim}_{0,3}(0) \,.\, \mathcal{G}^{+\wedge}_{0,3}. \tag{45}$$

2°) To describe (34), since it is already known on $\mathcal{G}^{+\wedge}_{0,3}$, it suffices to describe it on $\mathcal{M}^{\sim}_{0,3}[0]$ or even only on $\mathcal{M}^{\sim}_{0,3}(0)$ (subject of course to compatibilities…). And on $\mathcal{M}^{\sim}_{0,3}[0]$ it coincides with (33) — whereas on $\mathcal{M}^{\sim}_{0,3}(0)$ it is practically trivial and reduces to the multiplier μ

$$\Theta^{\pi}_{G} = \Theta^{\pi}_{B'_0} \quad \text{on } \mathcal{M}^{\sim}_{\rho|0,3}[0] \tag{46}$$

$$\begin{cases} \Theta^{\pi}_{G}(\underline{\underline{u}}) = i'_{T_0}(\mu) & \text{where } \mu \text{ is the multiplier of } \underline{\underline{u}} \\ \text{if|where} \quad \underline{\underline{u}} \in \mathcal{M}^{\sim}_{0,3}(0) \end{cases} \tag{47}$$

(this is even a possible definition of $\mathcal{M}^{\sim}_{0,3}(0)$).

Remark As Θ^{π}_{G} was constructed "by sheer strength of wrist|wrists" by way of $\Theta^{\pi}_{B'_0}$, i.e. $\underline{U}$ was constructed from $\underline{u}$, there was for a long time a sort of

[p. 484]

[scan 486]

confusion in my mind between $\underline{u}$ and $\underline{U}$, all the more so since most of the time I restricted myself to working in $\mathcal{M}^{\sim}_{0|\rho,3}[0]$ (after having fumbled about quite a bit with more varied points of view, before realizing that technically this was the most elegant way to proceed — from §46 on). This confusion was cleared up for good only yesterday and today, by dint of putting my feet in my own dishes again and again…

3°) The homomorphisms (35)(36) were obtained only by working in depth on the parameters α, β for $\underline{u}$ — here again, it suffices to work in $\mathcal{M}^{\sim}_{0,3}[0]$, and to define

$$\underline{\underline{u}} \longmapsto \underline{a}$$

$$\mathcal{M}^{\sim}_{0,3}[0] \longrightarrow T_{\rho}(\widehat{\mathbb{Z}})/\pm 1$$

$$\longrightarrow N'_{\sigma}(\widehat{\mathbb{Z}})/\pm 1$$

$$\underline{\underline{u}} \longmapsto \underline{b}$$

[p. 485]

[scan 487]

[p. 546]

so that it is trivial on L^{π}_0.

The quantities $\underline{a}, \underline{b}$ appeared in the calculations gradually starting with §44 (page 366′ and following), light began to be shed on their role only starting with §48 $\underline{\overline{\text{III}}}, \underline{\overline{\text{IV}}}, \underline{\overline{\text{V}}}$ — and a complete understanding of their nature, from the point of view of the group schemes that enter into the theory, likewise came about only in these very last days. This understanding moreover remains for the moment rather formal, and one should go deeper in several directions,

a) Make explicit the meaning from the point of view of the class fields of $\mathbb{Q}(j)$ and of[i1] $\mathbb{Q}(i)$.

b) Make explicit the meaning for the theory of "congruential|congruential" maps (i.e. subordinate|subordinate to [d3] representations of the quotient $\mathrm{Sl}(2, \widehat{\mathbb{Z}})'$ of $\mathrm{Sl}(2, \mathbb{Z})^{\wedge\prime}$) of the results obtained,

[scan 488]

c) Introduce on $\mathcal{M}_{\rho,\sigma}$ the elements of structure characteristic of arithmetic Galois groups – and make the connection with the typical constructions of this sort in class field theory.

d) Examine to what extent in this context one can bring in the seemingly draconian compatibility conditions on α, β of §47 linked to compatibility with

$$\varphi : \widehat{\Pi}'_{0,3} \xrightarrow{\sim} \mathcal{G}^{+\wedge}_{0,3}$$

– I foresee. moreover that the framework of the preceding calculations is too narrow to manage to bring these additional conditions into it.

e) What interests me most for the moment is a systematization of the preceding calculations in a framework much broader than that of the group SG alone and of the standard homomorphism

[p. 487]

[scan 489]

[p. 547]

$$\mathcal{G}_{0,3}^{+\wedge} \longrightarrow G(\widehat{\mathbb{Z}})/\pm 1$$

– I have the feeling of having put my finger on a systematic procedure for constructing "motivic" representations of $\Gamma_{\mathbb{Q}}$, via representations of the "geometric" part $\mathcal{G}_{0,3}^{+\wedge}$ of

$$\mathcal{M}_{0,3}^{+} \simeq \Pi_1(M_{0,3\,\mathbb{Q}}, \mathfrak{S}_3) \simeq \Pi_1(M'_{1,1\,\mathbb{Q}})$$

– or better, via[i1] representations of the discrete group $\mathcal{G}_{0,3}^{+} \simeq \mathrm{Sl}(2,\mathbb{Z})'$ (or the "variants such as $\mathrm{Sl}(2,\mathbb{Z})$, $\Pi_{0,3}$ …) with values in the integral points of group schemes (generically[i2] reductive ??) over $\mathbb{Z}$.

f) Yet there is another direction of investigation that attracts me a great deal, not necessarily linked to the introduction of group schemes, and which could be pursued in vitro|in addition[i3] within the framework of just the "big" profinite fundamental groups –

[p. 548]

Let us return for the moment to the question of identifying the four[i1] homomorphisms obtained (33) to (36), in terms of classical things. One can consider the homomorphism (33) $\Theta^{\pi}_{B'_0}$[i2] as being of an essentially technical nature, or at least as being subordinate to the homomorphism Θ^{π}_{G} of (34). Moreover, (35) and (36) are deduced from it, by composing them[i3] with the two homomorphisms

$$\Gamma^{\sim}_{0,3} \longrightarrow \mathcal{M}^{\sim}_{0,3}$$

(morally at least, for the moment !)[i4] associated with the [d1] points $\frac{1}{2}$ and $-\bar{j}$ of $U_{0,3\,\mathbb{Q}}(\mathbb{C})$, and which correspond, at the level of group schemes, to the two splittings ψ_ρ, ψ_σ of $\overset{(3)}{\mathcal{M}}_{\rho,\sigma}$ over $\overset{(31)}{\mathcal{T}}_{\rho,\sigma}$, given [d2] respectively by

$$\begin{cases} \psi_\rho : (\underline{a}, \underline{b}) \longmapsto (\underline{a}, \underline{b}, \underline{a}) \\ \psi_\sigma : (\underline{a}, \underline{b}) \longmapsto (\underline{a}, \underline{b}, \underline{b}) \end{cases} \tag{48}$$

m1149

Marginal note. [m1149]

$$\mathcal{T}'_{\rho,\sigma} \longrightarrow \mathcal{M}_{\rho,\sigma}$$
$$\mathcal{T}_{\rho,\sigma} \longrightarrow \mathcal{M}_{\rho,\sigma},$$

with this grain of salt that the first is defined only on the subgroup $\mathcal{T}'_{\rho,\sigma}$ defined by

$$\begin{cases} \mathcal{T}'_{\rho,\sigma} \subset \mathcal{T}_{\rho,\sigma} \\ \quad \| \quad \left\{ \left(\underset{\underset{T_\rho}{\cap\!\!\cap}}{\underline{a}}, \underset{N'_\sigma}{\underline{b}} \right) \;\middle|\; \det \underline{a} = \det \underline{b} \right\} \\ \quad \| \quad T_\rho \underset{\mathbb{G}_m}{\times} N'_\sigma. \end{cases} \tag{49}$$

and likewise d1 m1150

Marginal note. m1150
$$\begin{cases} \Psi^{\pi}_{-\bar{\jmath}|-\jmath} : \widetilde{\Gamma}'_{\mathbb{Q}} \simeq \widetilde{\mathcal{F}}'_{0,3} \longrightarrow T_\rho(\widehat{\mathbb{Z}})/\pm 1 \\ \widetilde{\Gamma}'_{\mathbb{Q}} = \{\gamma \in \widetilde{\Gamma}_{\mathbb{Q}} \mid \varepsilon_3(\mu) = 1, \text{ where } \mu = \chi(\gamma)\} \end{cases}$$

(50

We thus see that the indeterminacies of the signs for $\Theta^{\pi}_{\rho}, \Theta^{\pi}_{\sigma}$ correspond precisely to the indeterminacies for Θ_G itself — everything hangs together! The latter is removed [d2] tautologically when we replace $\widetilde{M}_{0,3}$ by the [d3] ad-hoc extension[i1] $\widetilde{\mathcal{T}}_{1,1}$ by ± 1, so that we find [m1152]

Marginal note. [m1152] We will note however that Θ^{π}_{ρ}, unlike the splitting $\Psi^{\pi}_{\rho} = \Psi^{\pi}_{1/2}$, is defined on $\widetilde{\mathcal{T}}_{0,3}$ in its entirety.

$$(50) \qquad \widetilde{\mathcal{T}}_{1,1} \longrightarrow \mathrm{GL}(2, \widehat{\mathbb{Z}})$$

and one should [d4] interpret this homomorphism as the fundamental "modular" homomorphism of the theory of elliptic curves (that the inverse image of [d5] $\Gamma_{\mathbb{Q}} \subset \tilde{\Gamma}_{\mathbb{Q}}$ in $\widetilde{\mathcal{T}}_{1,1}$ can be interpreted as $\mathcal{T}_{1,1} \simeq \pi_1(M_{1,1\,\mathbb{Q}})$ must be more or less tautological, by construction.)

It is clear in any case that the two coincide for every $\gamma \in \widetilde{M}_{0,3}$[i2] viewed as|when elements of

$$(51) \qquad \mu_2(\widehat{\mathbb{Z}}) = \{\pm 1\}^{\mathbb{P}} \qquad (\mathbb{P} = \text{set of prime numbers})$$

[p. 549] i.e. they coincide modulo a homomorphism

$$\tilde{\Gamma}_{\mathbb{Q}} \longrightarrow \mu_2(\widehat{\mathbb{Z}}) \simeq \{\pm 1\}^{\mathbb{P}}$$

i.e. a homomorphism

$$G_{\mathrm{m}}(\widehat{\mathbb{Z}})_2 = (\widehat{\mathbb{Z}}^*)_2 \simeq \{\pm 1\}^{\mathbb{P}} \longrightarrow {}_2G_{\mathrm{m}}(\widehat{\mathbb{Z}}) = \mu_2(\widehat{\mathbb{Z}}) \simeq \{\pm 1\}^{\mathbb{P}}$$

— so it is not a certain indeterminacy that is at issue! It is morally certain that the two coincide — I have not tried to prove it.

As for (35) (36), they must surely correspond to the action of $\Gamma_{\mathbb{Q}}$ on the Tate modules of elliptic curves with exceptional isomorphisms, corresponding precisely to the points $(1/2, 2, -1)$ and $(-\bar{\mathrm{j}}, -\mathrm{j})$ of $M_{0,3\,\mathbb{Q}} = M_{1,1}[2]'_{\mathbb{Q}}$. The indeterminacy of sign must|of which[i2] correspond|corresponds to the indeterminacy in lifting a point of $M_{1,1}[2]'_{\mathbb{Q}}$ to a point of $M_{1,1}[2]_{\mathbb{Q}}$, i.e. in choosing an elliptic curve (with "rigidification" of level 2) corresponding to the Legendre data $(0, 1, \infty, q|\rho)$ with $\rho|q = 1/2$ or $\rho|q = -\bar{\mathrm{j}}$. [scan 494]

Even once the ambiguity of sign for Θ^{π}_{G} is removed by passing to the two-sheeted extension $\widetilde{\mathcal{T}}_{1,1}$ of $\widetilde{M}_{0,3}$, the indeterminacy of the signs for $\Theta^{\pi}_{\rho}, \Theta^{\pi}_{\sigma}$ is not removed for all that, for the splittings[d1] $\Psi^{\pi}_{1/2}, \Psi^{\pi}_{-\bar{\mathrm{j}}}$) are not for all that splittings (even partial!) of[d2] the extension $\widetilde{\mathcal{T}}_{1,1}$, but only of $\widetilde{M}_{0,3}$ — and lifting them to splittings of $\widetilde{\mathcal{T}}_{1,1}$ over $\mathcal{T}_{1,1}$,[i1] amounts, very precisely, to choosing precisely elliptic curves with Legendre rigidification over the points $1/2, -\bar{\mathrm{j}}$. Thus, calculations made in terms of automorphisms of the groups with loops $\widehat{\Pi}_{0,3}$ or of[i2] $\mathcal{C}^{+\wedge}_{0,3}$, give back (without having looked for them!)[i3] results that fit very closely with particularly crucial arithmetico-geometric truths. [p. 550] 49. Homomorphisms of $M_{0,3}$, the general groups $M_{\rho,\sigma}$.
m1154

Where we get our feet wet…

Marginal note. m1154 All of this section I[i1] seems entirely useless for what follows, it is a preliminary groping to lead into section II page 553.

I) Consider a closed[i2] subgroup G of $M_{0,3}$, containing $\mathcal{C}^{+\wedge}_{0,3}$, hence the inverse image of a closed subgroup of $\tilde{\Gamma}_{0,3}$. We assume that the latter is "big enough" — say that it contains a subgroup of finite index in $\Gamma_{\mathbb{Q}} \subset \tilde{\Gamma}_{0,3}$. For the moment, we assume for simplicity that $G \subset \operatorname{Ker} \varepsilon_3$. In summary

$$(1) \qquad \mathcal{C}^{+\wedge}_{0,3} \subset G \subset \widetilde{M}_{0,3}, \qquad u \in G \Longrightarrow \mu(u) \equiv 1 \ (3).$$

This last hypothesis thus [d1]means[i3] that for every $u \in G$, we have $\alpha_0(u) \in \mathcal{C}^{\wedge+}_{0,3}$, so we have

$$(2) \qquad G \underset{\underline{\beta}_0}{\overset{\underline{\alpha}_0}{\rightrightarrows}} \mathcal{C}^{+}_{0,3} \ ,$$

characterized by

$$(2') \qquad \begin{cases} u(\rho) = \operatorname{int}(\alpha_0)\rho & \alpha_0 = \underline{\alpha}_0(u) \\ u(\sigma) = \operatorname{int}(\beta_0)\sigma & \beta_0 = \underline{\beta}_0(u). \end{cases}$$

We consider

$$(3) \qquad \begin{array}{c} G(0) = G \cap \widetilde{M}_{0,3}(0) \\ \cap \\ G[0] = G \cap \widetilde{M}_{0,3}[0] = \operatorname{Norm}_G(L^{\mathcal{C}}_0) \end{array}$$

so that

$$(4) \qquad G = G(0).\mathcal{C}^{+\wedge}_{0,3} \qquad \text{(semidirect product)}$$
$$(5) \qquad G[0] = G(0).L^{\mathcal{C}}_0 \qquad \text{id}$$
$$(6) \qquad G[0] \cap \mathcal{C}^{+\wedge}_{0,3} = L^{\mathcal{C}}_0.$$

We have set

$$(7) \qquad L^{\mathcal{C}}_0 = \text{closed subgroup of } \mathcal{C}^{+\wedge}_{0,3} \text{ generated by } \varepsilon_0$$

and we define likewise $L^{\mathcal{C}}_1, L^{\mathcal{C}}_\infty$. [p. 494]

[scan 496]

Consider a profinite[i1] group M, and a (continuous)[i3] surjective homomorphism

$$(8) \qquad \varphi : G \longrightarrow M.$$

We set

$$(9)\qquad \begin{cases} \varphi(\mathcal{C}_{0,3}^{+\wedge}) = \mathcal{C} & \text{normal subgroup of } M \\ \varphi(G(0)) = M(0) \\ \varphi(G[0]) = M[0]. \\ \varphi(L_0^{\mathcal{C}}) = L_0 \end{cases}$$

d6

Thus these are closed subgroups of M, satisfying

$$(10)\qquad M(0) \subset M[0] \subset \mathrm{Norm}_M(L_0)$$
$$(11)\qquad L_0 \subset \mathcal{C} \cap M[0].$$

By abuse of language, we still denote by $\rho, \sigma, \varepsilon_0, \varepsilon_1$ … the images of these elements in $\mathcal{C}$, which therefore satisfy there the relations known in $\mathcal{C}_{0,3}^{+\wedge}$, in particular

$$(12)\qquad \sigma^2 = \rho^3 = 1, \qquad \sigma\rho = \varepsilon_0, \quad \rho\sigma = \varepsilon_1, \qquad \varepsilon_1 = \sigma(\varepsilon_0) = \rho(\varepsilon_0).$$

The restrictions of the maps α_0, β_0 of (2,2') to $M_{\rho,\sigma}[0]$ will rather be denoted α, β, where α, β are in fact maps

$$(13)\qquad \begin{array}{c} SG \overset{\text{dfn}}{=} G \\ \text{by } L_0^{\mathcal{C}},\ \text{inverse} \\ \text{image of } G \\ \text{in } S\widetilde{M}_{0,3} \\ = \{(u,f) \in G \times \mathcal{C}_{0,3}^{+\wedge} \mid fu \in G[0]\} \end{array} \qquad \overset{\alpha}{\underset{\beta}{\rightrightarrows}}\ \mathcal{C}_{0,3}^{+\wedge}$$

of which we look at the restrictions to the subgroup ($\simeq M_{\rho,\sigma}[0]$) of SG defined by the relation $f = 1$.

Composing $\underline{\alpha}, \underline{\beta}$:

$$G[0] \rightrightarrows \mathcal{C}_{0,3}^{+\wedge}$$

with $\varphi \mid \mathcal{C}_{0,3}^{+\wedge}$, we find maps, again denoted $\underline{\alpha}, \underline{\beta}$ (where $\underline{\alpha}^M, \underline{\beta}^M$ in case of possible confusion)

$$(14)\qquad G[0] \overset{\underline{\alpha}}{\underset{\underline{\beta}}{\rightrightarrows}} \mathcal{C}$$

thus satisfying

$$(15)\qquad \begin{cases} u(\rho) = \mathrm{int}(\alpha)\rho \\ u(\sigma) = \mathrm{int}(\beta)\sigma \end{cases} \qquad \begin{array}{l} \text{for } u \in M[0] \text{ of the form } \varphi(u_0), \\ \text{and } \alpha = \underline{\alpha}(u_0),\ \beta = \underline{\beta}(u_0). \end{array}$$

[scan 497]

[p. 551]

A priori, α and β depend on the choice of u_0 from which u comes not only on u — but

$$(16) \qquad \begin{cases} \alpha\rho(\alpha)^{-1} = [u, \rho] \\ \beta\sigma(\beta)^{-1} = [u, \sigma] \end{cases}$$

do not depend on it. If we put

$$(17) \qquad T_\rho = \underline{\text{Centr}}_M(\rho) \qquad T_\sigma = \underline{\text{Centr}}_M(\sigma)$$

we thus see that, modulo T_ρ resp. T_σ, α, β depend only on u.

Hypothesis $\alpha = \alpha(u_0), \beta = \beta(u_0)$ depend only on $u = \varphi(u_0)$ (for $u_0 \in G[0]$).

We shall express this hypothesis in a slightly different way, by introducing

$$(18) \qquad J = \mathrm{Ker}(G[0] \longrightarrow M[0]),$$

we thus want that for

$$u_0' = \delta_0 u_0 \quad \text{with } u_0 \in G[0],\ \delta_0 \in J, \quad \text{we have}$$

$$\alpha(u_0') = \alpha(u_0), \qquad \beta(u_0') = \beta(u_0)$$

Write

$$\alpha_0 = \underline{\alpha}(u_0), \quad \beta_0 = \underline{\beta}(u_0), \quad \alpha_0' = \underline{\alpha}(u_0'), \quad \beta_0' = \underline{\beta}(u_0'), \quad \overline{\alpha}_0 = \underline{\alpha}(\delta_0), \quad \overline{\beta}_0 = \underline{\beta}(\delta_1|\delta_0),$$

in G, so that we shall have, by the cocycle formulas of G

$$\alpha_0' = \delta_0(\alpha_0)\overline{\alpha}_0, \qquad \beta_0' = \delta_0(\beta_0)\overline{\beta}_0,$$

whence, applying φ and noting that

$$\varphi(\delta_0(\alpha_0)) = \underbrace{\varphi(\delta_0)}_{1}(\varphi(\alpha_0)) = \varphi(\alpha_0) \overset{\text{dfn}}{=} \alpha \quad \text{and likewise}$$

$$\varphi(\delta_0(\beta_0)) = \varphi(\beta_0) \overset{\text{dfn}}{=} \beta$$

$$(19) \qquad \alpha' = \alpha\overline{\alpha}, \qquad \beta' = \beta\overline{\beta} \qquad \text{in } \mathcal{C}$$

where $\alpha, \beta, \alpha', \beta', \overline{\alpha}, \overline{\beta}$ are the images under φ of the quantities α_0 etc in $\mathcal{C}^{+\wedge}_{0,3}$. [d5] Thus the hypothesis means this

$$(20) \qquad \forall\, \delta_0 \in J \overset{\text{dfn}}{=} \mathrm{Ker}(G[0] \longrightarrow M[0]), \quad \text{we have} \quad \alpha^{\Pi}(\delta_0), \beta^{\Pi}(\delta_0) \in \mathrm{Ker}\varphi$$

[d6] When this hypothesis is satisfied, we thus have maps [p. 496]

[scan 498]

$$(21) \qquad M[0] \underset{\underline{\beta}}{\overset{\underline{\alpha}}{\rightrightarrows}} \mathcal{C}$$

d1 factoring (14), and thus satisfying

$$(22) \qquad \begin{cases} u(\rho) = \mathrm{int}(\alpha)\rho \\ u(\sigma) = \mathrm{int}(\beta)\sigma \end{cases} \qquad \text{for } u \in M[0], \quad \alpha = \underline{\alpha}(u), \quad \beta = \underline{\beta}(u),$$

which d2 paraphrase[i1] (2').

Moreover, let us put

$$(23) \qquad \zeta|\xi = \alpha\rho(\alpha)^{-1}, \qquad \eta = \beta\sigma(\beta)^{-1}$$

the relations (22) can be written thus

$$(24) \qquad u(\rho) = \zeta|\xi\rho, \qquad u(\sigma) = \eta\sigma$$

and we shall have

$$(25) \qquad \zeta|\xi = [u, \rho], \qquad \eta = [u, \sigma]$$

and moreover

$$(26) \qquad \zeta|\xi = \eta\varepsilon_1|{\ell_1}^{\nu} \qquad \text{where } \nu = \frac{\mu - 1}{2} \in \widehat{\mathbb{Z}} \quad (\mu \text{ the multiplier of } u).$$

which comes from the single relation in $\mathcal{C}^{+}_{0,3}$.

(We assume to fix ideas that the homomorphism

$$G \xrightarrow{\chi^G} \widehat{\mathbb{Z}}^* \qquad (\text{"multiplier"})$$

factors through

$$(27) \qquad G \longrightarrow M \xrightarrow{\chi^M} \widehat{\mathbb{Z}}^*,$$

so that we have a notion of multiplier ($\in \widehat{\mathbb{Z}}^*$) for the $u \in M$.)

Consider the natural homomorphism

$$(28) \qquad \begin{array}{ccc} M[0] & \longrightarrow & \mathrm{Aut}(\mathcal{C}) : \\ u & \longmapsto & \mathrm{int}(u)|\mathcal{C} \end{array}$$

we see from (22) even|or even (24)[i2] that it is known when we know [p. 497]

[scan 499]

[p. 552]
m1155

Marginal note. m1155 for d1 ρ, σ generate topologically $\mathcal{C}$

the functions $\underline{\alpha}, \underline{\beta} : M[0] \longrightarrow \mathcal{C}$, and even when we know only $\zeta|\xi, \eta : M[0] \longrightarrow \mathcal{C}$. If moreover we put

$$M'[0] = \mathrm{Im}(M[0] \longrightarrow \mathrm{Aut}(\mathcal{C})) \tag{29}$$

these latter functions $\zeta|\xi, \eta$ are already defined on $M'[0]$ — whereas it is not clear that the same holds for α, β, when $M[0]$ does not act|does not operate faithfully on $\mathcal{C}$. We thus have a map $(\zeta|\xi, \eta)$[i1] from a certain subgroup $M'[0] \subset \mathrm{Norm}_{\mathrm{Aut}(\mathcal{C})}(L_0)$ to the set $\mathcal{R}$ of solutions of the equation in $\zeta|\xi, \eta$ (26) which we write|shall write simply

$$\eta^{-1}\zeta|\xi \in L_1 \tag{30}$$

a relation which implies (26) (with the precise form of the exponent ν) if we assume (for example)[i2] $\mathcal{C}|M$ big enough that $\mathcal{C}^{+\wedge}_{0,3} \xrightarrow[2]{} \mathrm{SL}|\mathrm{PSL}(2, \widehat{\mathbb{Z}})$ [i3] factors through $\mathcal{C}$ — which we shall assume, to make life easier for ourselves.

d2 More precisely, let[i4] d3

$$(32) \qquad \left\{ \begin{array}{l} \qquad\qquad = \Sigma_{\mathcal{C},\rho,\sigma} \subset \mathcal{C} \times \mathcal{C} \\ \qquad\qquad\qquad\qquad \| \\ \left\{ \begin{array}{l|l} (\zeta|\xi, \eta) & \begin{array}{ll} \text{a)} & \zeta|\xi\rho \text{ conjugate to } \rho \quad \text{in } \mathcal{C} \\ \text{b)} & \eta\sigma \quad \underline{\qquad\qquad\qquad} \quad \sigma \quad \underline{\qquad\qquad} \\ \text{c)} & \eta^{-1}\zeta|\xi \in L_1 \quad \text{i.e.} \quad \exists \nu' \in \widehat{\mathbb{Z}} \text{ such that } \zeta|\xi = \eta\varepsilon_1^{\nu'} \end{array} \end{array} \right. \end{array} \right\}$$

Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

140-3-s499-D006 *deletion. Manuscript:* For every $u \in \mathrm{Aut}(\mathcal{C})$ normalizing L_0, and fixing must and fixing the conjugacy class of ρ and that of σ, i.e. such|such that

$$\zeta|\xi = [u, \rho] \qquad (\zeta|\xi, \eta) = ([u, \rho], [u, \sigma])$$

satisfy|satisfies the first two conditions of (33), and
Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 500]

and let $u \in \mathrm{Aut}(\mathcal{C})$ be an automorphism of $\mathcal{C}$, and let us put

$$(34) \qquad \begin{cases} \zeta|\xi = [u, \rho] = u\rho u^{-1}\rho^{-1} = u(\rho)\rho^{-1} & \text{i.e. } u(\rho) = \zeta|\xi\rho \\ \eta = [u, \sigma] = u(\sigma)\sigma^{-1} & \text{i.e. } u(\sigma) = \eta\sigma \end{cases}$$

then to say that $\zeta|\xi\rho$ $(= u(\rho))^{\mathrm{i1}}$ is conjugate to ρ means that u fixes the conjugacy class of ρ, to say that $\eta\sigma$ $(= u(\sigma))^{\mathrm{i2}}$ is conjugate of|to σ means that u fixes the conjugacy class of σ. Finally the condition $\eta^{-1}\zeta|\xi \in L_1$ can also be written, since cf. (24),(25)

$$\eta^{-1}\zeta|\xi = (\sigma u(\sigma^{-1}))(u(\rho)\rho^{-1}) = \sigma u(\sigma^{-1}\rho)\rho^{-1}$$
$$= \sigma \left(u(\underbrace{\sigma^{-1}\rho}_{\varepsilon_0})\, \underbrace{\rho^{-1}\sigma}_{\varepsilon_0^{-1}} \right)$$

d2

N.B. $\sigma^{-1} = \sigma$

$$= \sigma(u(\varepsilon_0)\varepsilon_0^{-1})$$

in the form

$$\sigma(u(\varepsilon_0)\varepsilon_0^{-1}) \in L_1 \qquad \text{i.e.} \qquad u(\varepsilon_0)\varepsilon_0^{-1} \in L_0$$

(since $L_0 = \sigma^{-1}(L_1)$) or again (since ε_0 [d3]$\in L_0$[i3])

$$u(\varepsilon_0) \in L_0, \quad \text{i.e. (since } \varepsilon_0 \text{ generates } L_0)$$

m1159

Marginal note. [m1159] In this argument, we have used only the relation $\sigma^{-1}\rho = \varepsilon_0$ and the fact that ε_0 generates L_0, and not that $\sigma^2 = 1$ or $\rho^3 = 1$ for example.

$$u(L_0) = L_0$$

i.e. that u normalizes L_0.

Thus let

$$(35) \qquad \left\{ \begin{array}{c} \widetilde{B}_0' \subset \mathrm{Aut}(\mathcal{C}) \\ \| \text{ dfn} \\ \left\{ u \in \mathrm{Aut}(\mathcal{C}) \;\middle|\; \begin{array}{l} u \text{ fixes conjugacy class of } \rho \text{ and that of } \sigma \\ u \text{ normalizes } L_0 \end{array} \right\} \end{array} \right.,$$

so that we have a map (injective because ρ, σ generate $\mathcal{C}$)

$$(36) \qquad \begin{array}{ccc} \widetilde{B}_0' & \hookrightarrow & \Sigma \\ u & \longmapsto & ([u,\rho] = u(\rho)\rho^{-1},\ [u,\sigma] = u(\sigma)\sigma^{-1}). \end{array}$$

[p. 553]

$$(37) \qquad \left\| \begin{array}{l} \text{Fundamental hypothesis on } \mathcal{C}, \text{ equipped with } \rho, \sigma, \text{ whence } \varepsilon_0 = \sigma^{-1}\rho, \\ \varepsilon_1 = \rho\sigma^{-1} = \sigma(\varepsilon_0) = \rho(\varepsilon_0) : \\ \text{a) } \mathcal{C} \text{ is generated topologically by } \rho, \sigma \\ \text{b) The map (36) (injective by a)) is} \\ \quad \text{bijective.} \end{array} \right.$$

d3

Condition b) thus means that for [d4] $(\alpha, \beta) \in \mathcal{C} \times \mathcal{C}$, satisfying a relation

$$\underline{\alpha\rho(\alpha)^{-1}} = \underline{\beta\sigma(\beta)^{-1}}\varepsilon_1^{\nu'}, \qquad \nu''|\nu' \text{ suitable},$$

there exists $u \in \mathrm{Aut}(\mathcal{C})$ such that we have

$$[u, \rho] = \alpha\rho(\alpha)^{-1} \quad \text{i.e. } u(\rho) = \mathrm{int}(\alpha)(\rho) \quad \text{i.e. } u(\rho)|u\rho) = \zeta|\xi\rho$$
$$[u, \sigma] = \beta\sigma(\beta)^{-1} \quad \text{i.e. } u(\sigma) = \mathrm{int}(\beta)\sigma \quad \text{i.e. } u(\sigma) = \eta\sigma$$

(we shall thus necessarily have $u \in B_0'$ }, and u will be unique if we have a)).

Thus, on the set of the|of $R|\mathcal{R}_{\rho,\sigma}$ of the $(\zeta|\xi, \eta)$ satisfying a) b) c), we shall have a group structure, +|and deduced|described by transport of structure from that of $\widetilde{B}_0'$

etc.

[scan 502]

The groups $M_{\rho,\sigma}$ etc

II Let us return to the situation above, forgetting (at least for the moment) G, φ etc.
m1162

Marginal note. [m1162] For a systematic rectification of the notations that follow|following cf. page 564, remark.

Let $\mathcal{C}$ be a group — we place ourselves, for what follows, either in the category of discrete groups, or in that of profinite groups, as we choose. We shall (to fix ideas) take that of profinite groups. We suppose given

$$(1) \qquad \rho, \sigma \in \mathcal{C}$$

m1163

Marginal note. m1163 [i.e. we have between $\varepsilon_0 = \ell'_0$, $\sigma = \ell'_1$ and $\rho^{-1} = \ell'_\infty$ with relation (2) $\ell'_\infty \ell'_1 \ell'_0 = 1$]

we put

$$(3)\qquad \begin{aligned} &\varepsilon_0 = \sigma^{-1}\rho, \qquad \varepsilon_1 = \rho\sigma^{-1} = \sigma(\varepsilon_0) = \rho(\varepsilon_0) \\ &L_0 = \text{closed subgroup generated by } \varepsilon_0 \\ &L_1 = \underline{\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad} \ \varepsilon_1 \end{aligned} \quad \text{, i.}$$

thus $L_1 = \rho(L_0) = \sigma(L_0)$.

We d1 consider

$$\mathrm{Aut}(\mathcal{C}) \xrightarrow{\Phi=(\underline{\zeta|\xi},\underline{\eta})} \mathcal{C} \times \mathcal{C}$$

(4) defined by

$$(5)\qquad \begin{cases} \underline{\zeta|\xi}(u) = [u,\rho] = u\rho u^{-1}\rho^{-1} = u(\rho)\rho^{-1} & \text{thus } u(\rho) = \zeta|\xi\rho \quad (\zeta|\xi = \underline{\zeta|\xi}(u)) \\ \qquad\quad = u\rho(u)^{-1} & \\ \underline{\eta}(u) = [u,\sigma] = u\sigma u^{-1}\sigma^{-1} = u(\sigma)\sigma^{-1} & \text{thus } u(\sigma) = \eta\sigma \quad (\eta = \underline{\eta}(u)) \\ \qquad\quad = u\sigma(u)^{-1}. & \end{cases}$$

Thus for $u \in \mathrm{Aut}(\mathcal{C})$, and $\zeta|\xi = \underline{\zeta|\xi}(u)$, $\eta = \underline{\eta}(u)$, we have

$$(6)|(5)\qquad \begin{cases} u \text{ fixes the } \mathcal{C}\text{-conjugation class of } \rho & \iff \quad \zeta|\xi\rho \text{ conjugate to } \rho \\ & \iff \quad \zeta|\xi = \alpha\rho(\alpha)^{-1} \quad (\alpha \in \mathcal{C}) \\ u \text{ fixes the } \mathcal{C}\text{-conjugation class of } \sigma & \iff \quad \eta\sigma \text{ conjugate to } \sigma \\ & \iff \quad \eta = \beta\sigma(\beta)^{-1} \quad (\beta \in \mathcal{C}) \\ u \text{ normalizes } L_0 \iff \eta^{-1}\zeta|\xi \in L_1 & \iff \quad \zeta|\xi = \eta\varepsilon_1^\nu \quad \text{with } \nu \in \widehat{\mathbb{Z}} \text{ suitable.} \end{cases}$$

[scan 503]

[p. 554] Let|Let d1

$$(7)\qquad \begin{aligned} &B_{\rho,\sigma} \subset \mathrm{Aut}(\mathcal{C}) \\ &\{u \mid \text{satisfying the three conditions } (6|5)\} \end{aligned}$$

$$\Sigma_{\rho,\sigma} \subset \mathcal{C} \times \mathcal{C}$$
$$\| \tag{8}$$
$$\left\{ (\zeta|\xi, \eta) \;\middle|\; \begin{array}{c} \zeta|\xi = \alpha\rho(\alpha)^{-1}, \quad \eta = \beta\sigma(\beta)^{-1} \quad (\alpha, \beta \in \mathcal{C}) \\ \text{i.e. } \zeta|\xi\rho \text{ conjugate to } \rho, \qquad \text{i.e. } \eta\sigma \text{ conjugate to } \sigma \\ \eta^{-1}\zeta|\xi \in L_1 \quad \text{i.e. } \zeta|\xi = \eta\varepsilon_1^{\nu} \quad (\nu \in \widehat{\mathbb{Z}}) \end{array} \right\},$$

so that $B_{\rho,\sigma}$ is the inverse image of $\Sigma_{\rho,\sigma}$ under (4), and we have an induced map

$$B_{\rho,\sigma} \xrightarrow{\varphi=\varphi_{\rho,\sigma}} \Sigma_{\rho,\sigma}. \tag{9}$$

We suppose

$$\boxed{\begin{cases} \text{a)} & \rho, \sigma \text{ generate } \mathcal{C} \text{ topologically} \\ \text{b)} & \text{the map (9) (injective by a))} \\ & \text{is surjective (thus bijective).} \end{cases}} \tag{10}$$

m1164

Marginal note. m1164 Careful, this condition is d2 satisfied for $\mathcal{C} = \mathrm{SL}(2, \widehat{\mathbb{Z}})'$! (it imposes d3 $\varepsilon = \varepsilon_3(\mu)$ on the group γ on writing $\zeta|\xi, \eta$...)

We then transport by φ the group structure of $B_{\rho,\sigma}$ to $\Sigma_{\rho,\sigma}$. We d4put i2 d5

$$u_{\zeta|\xi,\eta} = \varphi^{-1}(\zeta|\xi, \eta) \in B_{\rho,\sigma} \qquad ((\zeta|\xi, \eta) \in \Sigma_{\rho,\sigma}), \tag{11}$$

so that d6 $u_{\zeta|\xi,\eta}$ is characterized by

$$\begin{cases} u_{\zeta|\xi,\eta}(\rho) = \zeta|\xi\rho \\ u_{\zeta|\xi,\eta}(\sigma) = \eta\sigma \end{cases} \tag{12}$$

Hypothesis b) therefore means that, as soon as $(\zeta|\xi, \eta) \in \Sigma_{\rho,\sigma}$ i.e. $\zeta|\xi\rho$ conjugate to ρ, $\eta\sigma$ conjugate to σ and $\eta^{-1}\zeta|\xi \in L_1$, there exists [p. 502]

[scan 504]

an automorphism $u_{\zeta|\xi,\eta}$ of $\mathcal{C}$ satisfying (12) (and which will be unique by (10) a)). The group law on $\Sigma_{\rho,\sigma}$ is made explicit as follows:

$$(13)\quad (\zeta|\xi', \eta')(\zeta|\xi, \eta) = (\zeta|\xi'', \eta'') \quad \text{with} \quad \begin{cases} \zeta|\xi'' = u_{\zeta|\xi',\eta'}(\zeta|\xi)\zeta|\xi' \\ \eta'' = u_{\zeta|\xi',\eta'}(\eta)\eta'. \end{cases}$$

Let us consider the homomorphism d1 d2 d3

$$\mathcal{C} \longrightarrow \mathrm{Aut}(\mathcal{C})$$

$$g \longmapsto \mathrm{int}(g)$$

and the inverse image of $B_{\rho,\sigma}$ is none other than the normalizer of L_0 in $\mathcal{C}$, i.e. N_0. We then want to construct a group $G_{\rho,\sigma}$, containing $\mathcal{C}$ as an invariant subgroup[i1] and into which d4 $B_{\rho,\sigma}$ maps, so that the tautological action of $B_{\rho,\sigma}$ on $\mathcal{C}$ is deduced from this homomorphism, and $G_{\rho,\sigma}$ is generated by $\mathcal{C}$ and the image of $B_{\rho,\sigma}$, denoted $B'_{\rho,\sigma}$, which will contain d5 N_0.

d6If[i2] the center of $\mathcal{C}$ is trivial i.e.

$$\mathcal{C} \hookrightarrow \mathrm{Aut}(\mathcal{C})$$

($\mathcal{C}$ normal subgroup), d7

$$\longrightarrow$$

$$\longmapsto$$

it suffices to take the subgroup $G_{\rho,\sigma}$ of $\mathrm{Aut}(\mathcal{C})$ generated by $\mathcal{C}$ and $B_{\rho,\sigma}$.

d12 But the hypothesis that the center of $\mathcal{C}$ be|is trivial is not a happy one — for example it is not satisfied if $\mathcal{C} = \mathrm{SL}(2, \widehat{\mathbb{Z}})/\pm 1$. It seems to me that the introduction of N_0 (over which in practice we have no control) [p. 503]

[scan 505]

[p. 555] was not judicious either, and [d1] the condition $B'_{\rho,\sigma} \supset N_0$ — it suffices to have $B'_{\rho,\sigma} \supset L_0$. I shall therefore consider

$$(14) \quad \Big\{ S_0 G_{\rho,\sigma} \overset{\text{dfn}}{=} B_{\rho,\sigma} \cdot \mathcal{C} \qquad \text{the product } \tfrac{1}{2} \text{ direct, and}$$

$$L_0 \overset{i}{\hookrightarrow} S_0 G_{\rho,\sigma}$$

$$g \longmapsto \mathrm{int}(g^{\mathcal{C}}) \cdot g^{-1}$$

the image of this homomorphism is a normal subgroup, for a) it commutes with $\mathcal{C}$ (trivial) and b) it is invariant under $B_{\rho,\sigma}$, for we shall have for $u \in B_{\rho,\sigma}$

$$\mathrm{int}(u)(i(g)) = \mathrm{int}(u)(\mathrm{int}(g) \cdot g^{-1}) = \mathrm{int}(u(g)) \cdot \underbrace{\mathrm{int}(u)(g^{-1})}_{u(g^{-1}) = u(g)^{-1}} = i(u(g))$$

(i.e. i commutes with the actions of $B_{\rho,\sigma}$, operating on L_0 by restriction to L_0 of the tautological|total[i1] operation of $B_{\rho,\sigma}$ on $\mathcal{C}$, and on [d3]$S_0 G_{\rho,\sigma}$[i2] $\supset B_{\rho,\sigma}$ by inner automorphisms).

We can therefore consider

$$G_{\rho,\sigma} \overset{\text{dfn}}{=} S_0 G_{\rho,\sigma}/i(L_0) \tag{15}$$

then the inclusion homomorphisms

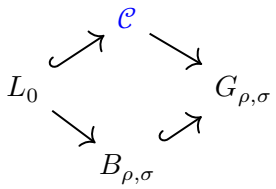
$$B_{\rho,\sigma} \hookrightarrow S_0 G_{\rho,\sigma}$$

,

$$\mathcal{C} \longrightarrow S_0 G_{\rho,\sigma}$$

give, by composition with

$$S_0 G_{\rho,\sigma} \longrightarrow G_{\rho,\sigma}$$



, homomorphisms

$$\mathcal{C} \longrightarrow G_{\rho,\sigma}$$

,

$$B_{\rho,\sigma} \hookrightarrow G_{\rho,\sigma}$$

(16) making the diagram commutative

(17) We note

$$\mathrm{Ker}(\mathcal{C} \longrightarrow G_{\rho,\sigma}) = L_0 \cap \mathrm{Centr}(\mathcal{C}) = \mathrm{Ker}(L_0 \longrightarrow B_{\rho,\sigma}) \tag{18}$$

[scan 506]

In the case $\mathcal{C} = \mathrm{SL}(2, \widehat{\mathbb{Z}})'$, (with ρ, σ as usual) we shall have $L_0 \cap \mathrm{Centr}(\mathcal{C}) = \{1\}$. Thus it does not seem a priori that there are any major drawbacks to supposing that

$$(18) \qquad L_0 \cap \mathrm{Centr}(\mathcal{C}) = \{1\} \quad \text{i.e.}$$

$$\mathcal{C} \hookrightarrow G_{\rho,\sigma} \quad \text{injective}$$

Let us note that [d1] the image of

$$L_0 \longrightarrow B_{\rho,\sigma}$$

$$\ell \longmapsto \mathrm{int}(\ell)$$

(composite of (14) and the projection $S_0 G_{\rho,\sigma} \longrightarrow B_{\rho,\sigma}$) is obviously invariant|invariant, and putting

$$(19) \qquad \Gamma^*_{\rho,\sigma}|\gamma_{\rho,\sigma} = B_{\rho,\sigma}/\operatorname{Im} L_0$$

we find

$$(20) \qquad G_{\rho,\sigma}/\mathcal{C}_{\rho,\sigma} \simeq B_{\rho,\sigma}/L_0 \simeq \Gamma|\gamma_{\rho,\sigma}.$$

m1165

Marginal note. [m1165] i.e. homomorphism of exact sequences

$$\begin{array}{ccccccccc} 1 & \longrightarrow & L_0 & \longrightarrow & B_{\rho,\sigma} & \to & \Gamma|\gamma_{\rho,\sigma} & - & 1 \\ & & \downarrow & & \downarrow & & \| & & \\ 1 & \longrightarrow & \mathcal{C} & \longrightarrow & G_{\rho,\sigma} & \to & \Gamma|\gamma_{\rho,\sigma} & - & 1 \\ & & \| & & & & & & \\ & & SG_{\rho,\sigma} & & & & & & \end{array}$$

[scan 507]

[p. 556]

But in the more general cases to which we aspire, one must not at all expect $\Gamma_{\rho,\sigma}$ to be so small — for example that it be commutative. For example in the "universal" case, $\mathcal{C} = \mathcal{C}^{+\wedge}_{0,3}$, we will have

$$B_{\rho,\sigma} = \widetilde{M}_{0,3}[0]' = \mathrm{Ker}(\widetilde{M}_{0,3}[0] \xrightarrow{\varepsilon_3} \{\pm 1\}) \tag{23}$$

hence

$$\Gamma_{\rho,\sigma} \simeq \tilde{\Gamma}'_{0,3} \quad (\supset \Gamma'_{\mathbb{Q}} \ !). \tag{24}$$

On the other hand, we should be able without inconvenience to postulate the existence of a canonical[i1] splitting of the extension $B_{\rho,\sigma}$ of $\Gamma_{\rho,\sigma}$ by L_0. In fact, if we assume, [d1] [d2] in the general case, where nevertheless we assume $\sigma^2 = \rho^3 = 1$, i.e. $\mathcal{C}$ a quotient of $\mathcal{C}^{+\wedge}_{0,3}$, that the

quotient $\mathcal{C}$ of $\mathcal{C}^{+\wedge}_{0,3}$ is large enough to map to GP|CP($\widehat{\mathbb{Z}}$), then [d3] $B_{\rho,\sigma} \simeq \Sigma_{\rho,\sigma}$ maps to $\widetilde{B}'_{0,3}|\widetilde{B}'_0$, and the inverse image of $\tilde{T}_0$ is a subgroup (which we could denote $T_{\rho,\sigma}$)

$$T_{\rho,\sigma} \subset B_{\rho,\sigma} \qquad T_{\rho,\sigma} \overset{\sim}{\to} \Gamma_{\rho,\sigma} \tag{25}$$

which is a section subgroup, for $B_{\rho,\sigma} \to \Gamma_{\rho,\sigma}$, and also (as a subgroup of $G_{\rho,\sigma}$) for $G_{\rho,\sigma} \to \Gamma_{\rho,\sigma}$, so that we will have

$$B_{\rho,\sigma} \simeq T_{\rho,\sigma}.L_0, \quad G_{\rho,\sigma} \simeq T_{\rho,\sigma}.\mathcal{C} \qquad (\tfrac{1}{2}\text{-direct products}) \tag{26}$$

[scan 508]

Now let

$$\left\{ \begin{array}{c} S_0 g_{\rho,\sigma} \subset \mathcal{C} \times \mathcal{C} \\ \| \text{ dfn} \\ \left\{ (\alpha,\beta) \;\middle|\; \underbrace{\alpha\rho(\alpha)^{-1}}_{\zeta|\xi} = \underbrace{\beta\sigma(\beta)^{-1}}_{\eta} \varepsilon_1^{\nu}, \text{ for } \nu \in \widehat{\mathbb{Z}} \text{ suitable} \right\} \\ \text{i.e.} \qquad \eta^{-1}\zeta|\xi \in L_1 \end{array} \right. \tag{27}$$

We have a canonical map

$$\left\{ \begin{array}{l} S_0 g_{\rho,\sigma} \longrightarrow \Sigma_{\rho,\sigma} \\ (\alpha,\beta) \longmapsto (\zeta|\xi,\eta), \quad \begin{array}{rl} \zeta|\xi & = \alpha\rho(\alpha)^{-1} \\ \eta & = \beta\sigma(\beta)^{-1} \end{array}, \end{array} \right. \tag{28}$$

which is a surjection by [d4]definition[i1] of $\Sigma_{\rho,\sigma}$, and in fact by hypothesis (10) we have almost[i2] a canonical section

$$\Sigma_{\rho,\sigma} \longrightarrow S_0 g_{\rho,\sigma}$$

$$(\zeta|\xi,\eta) \longmapsto u_{\zeta|\xi,\eta}$$

except that $u_{\zeta|\xi,\eta}$ is not in $\mathcal{C}$, but only in $G_{\rho,\sigma}$. We are going to consider the sets|the set of larger size

$$g_{\rho,\sigma} \subset G_{\rho,\sigma} \times G_{\rho,\sigma}$$
$$\| \text{ dfn}$$
$$\left\{ (\alpha\beta) \;\middle|\; \underbrace{\alpha\rho(\alpha)^{-1}}_{\zeta|\xi} = \underbrace{\beta\sigma(\beta)^{-1}}_{\eta} \varepsilon_1^{\nu} \quad \text{for } \nu \in \widehat{\mathbb{Z}} \text{ suitable} \right\} \tag{29}$$
$$\zeta|\xi$$

m1167

Marginal note. m1167 N.B. We will also have $\zeta|\xi = \alpha(\rho)\rho^{-1}$, $\eta = \beta(\sigma)\sigma^{-1}$ hence $\zeta|\xi, \eta \in \mathcal{C}$ (since $\mathcal{C}$ invariant in $G_{\rho,\sigma}$)

so that we will have

$$Sg_{\rho,\sigma} = g_{\rho,\sigma} \cap (\mathcal{C} \times \mathcal{C}). \tag{30}$$

(assuming (18) to simplify). [p. 507]

[p. 508] [p. 557]

d1 We find again

$$\begin{cases} g_{\rho,\sigma} \longrightarrow \Sigma_{\rho,\sigma} \\ (\alpha,\beta) \longmapsto (\zeta|\xi,\eta), \quad \begin{matrix} \zeta|\xi & = \alpha\rho(\alpha)^{-1} = [\alpha,\rho] = \alpha(\rho)\rho^{+1|-1} \\ \eta & = \beta\sigma(\beta)^{-1} = [\beta,\sigma] = \beta(\sigma)\sigma^{-1} \end{matrix} \end{cases} \tag{31}$$

(by definition of $B_{\rho,\sigma}$ we do indeed find that the $(\zeta|\xi,\eta)$ associated with the (α,β) are in $\Sigma_{\rho,\sigma}$). This time hypothesis (10) implies that we have a canonical section

$$\begin{matrix} \Sigma_{\rho,\sigma} \longrightarrow g_{\rho,\sigma} \\ (\zeta|\xi,\eta) \longrightarrow (u_{\zeta|\xi,\eta}, u_{\zeta|\xi,\eta}) \end{matrix} \tag{32}$$

and we find the same|the statements of § 48 III).

Theorem Let us consider d2 subgroups of $G_{\rho,\sigma}$

$$\begin{cases} Z_\rho = \underline{\mathrm{Centr}}_{G_{\rho,\sigma}}(\rho) \\ Z_\sigma = \underline{\mathrm{Centr}}_{G_{\rho,\sigma}}(\sigma) \end{cases}, \tag{33}$$

m1168

Marginal note. m1168 (N.B. in the case $\mathcal{C} = \mathrm{SL}(2,\widehat{\mathbb{Z}})'$ etc., we will have

$$Z_\rho = T_\rho, \qquad Z_\sigma = N'_\sigma$$

and the product group

$$B_{\rho,\sigma} \times T_\rho \times T_\sigma$$

then we have a i2 d6 bijective map

$$\begin{matrix} B_{\rho,\sigma} \times T_\rho | Z_\rho \times T_\sigma | Z_\sigma \xrightarrow{\sim} g_{\rho,\sigma} \\ (u,a,b) \longmapsto (ua^{-1}, ub^{-1}) \end{matrix} \tag{34}$$

m1169

Marginal note. m1169 by definition of $B_{\rho,\sigma}$ (7) and we see that $Z_\rho \to B_{\rho,\sigma}$ and $Z_\sigma \to B_{\rho,\sigma}$ are epimorphisms, hence also their composites $\delta_\rho, \delta_\sigma$ with $B_{\rho,\sigma} \to \Gamma_{\rho,\sigma}$. hence the maps (35) are epimorphisms.

Corollary. Let us consider the group homomorphisms $\delta_B : B_{\rho,\sigma} \to \Gamma_{\rho,\sigma}$, i4

$$\{\delta_G : G_{\rho,\sigma} \longrightarrow \Gamma_{\rho,\sigma}, \quad \delta_\rho : Z_\rho \longrightarrow \Gamma_{\rho,\sigma}, \quad \delta_\sigma : Z_\sigma \longrightarrow \Gamma_{\rho,\sigma}, \tag{35}$$

$\delta_B : B_{\rho,\sigma} \to \Gamma_{\rho,\sigma}$ i5 δ_G is the canonical homomorphism of passage to the quotient $\mathcal{C}_{\rho,\sigma} = \mathcal{C}$, and $\delta_\rho, \delta_\sigma, \delta_B$ are the composites of δ_G with the inclusions $Z_\rho \subset G_{\rho,\sigma}$, $Z_\sigma \hookrightarrow G_{\rho,\sigma}$, $B_{\rho,\sigma} \subset G_{\rho,\sigma}$ i7

[scan 510]
m1170

Marginal note. m1170 denoted $S_0\Gamma^b_{\rho,\sigma}$ in the § 48, $\overline{\text{IX}}$ ff

Let

$$S_0\Gamma^{b_0}_{\rho,\sigma} \subset B_{\rho,\sigma} \times Z_\rho \times Z_\sigma \tag{36}$$
$$\| \text{ dfn}$$
$$\{(u,a,b) \mid \delta_G(u) = \delta_\rho(a) = \delta_\sigma(b)\}.$$

d2 i.e.

$$S\Gamma'_{\rho,\sigma} = B_{\rho,\sigma} \times_{\Gamma_{\rho,\sigma}} Z_\rho \times_{\Gamma_{\rho,\sigma}} Z_\sigma. \tag{37}$$

a bijection [d3]

$$\begin{aligned} S_0\Gamma^{b_0}_{\rho,\sigma} &\xrightarrow{\ \sim\ } S_0 g_{\rho,\sigma} \quad \text{(defined in (27))} \\ (u,a,b) &\longmapsto (\zeta|\xi,\eta), \quad \text{with } \zeta|\xi = ua^{-1},\ \eta = ub^{-1}. \end{aligned} \tag{38}$$

[m1171]

Marginal note. [m1171] N.B. The letter S here is inspired by the usage of Mister Ahlfors for the "special Teichmüller groups", and does not at all have the same meaning as in SZ_ρ, SZ_σ, where it indicates that we take the kernels of $\delta_\rho, \delta_\sigma$ (playing the role of a "determinant"…)

⟹

Scholium By the bijections (34) (38), we transport onto $g_{\rho,\sigma}$, $S_0 g_{\rho,\sigma}$ the natural group structures of $\tilde{\Gamma}_{\rho,\sigma}$, $\Gamma^{b_0}_{\rho,\sigma}$. Making this group structure explicit we find in particular for $Sg_{\rho,\sigma}$

$$\begin{cases} (\alpha',\beta')(\alpha,\beta) = \alpha''\beta'', \quad \text{with } \alpha'' = u'(\alpha)\alpha', \quad \beta'' = u'(\beta)\beta'. \\ u' = u_{\zeta|\xi',\eta'} : \ \mathcal{C} \longrightarrow \mathcal{C}\ , \quad \text{defined by } \begin{cases} u(\rho) = \zeta|\xi\rho = \mathrm{int}(\alpha)\rho \\ u(\sigma) = \eta\sigma = \mathrm{int}(\beta)\sigma \end{cases} \end{cases} \tag{39|37}$$

(with $\zeta|\xi = \alpha\rho(\alpha)^{-1},\ \eta = \beta\sigma(\beta)^{-1}$).

In $S_0\Gamma^{b_0}_{\rho,\sigma}$ we have a subgroup isomorphic to L_0, i.e. [m1172]

Marginal note. [m1172]

$$\begin{aligned} L_0 &\longrightarrow S\Gamma'_{\rho,\sigma} \\ \ell &\longmapsto (\ell,1,1) \end{aligned} \tag{39}$$

and we have exact sequence

$$1 \to L_0 \to S\Gamma'_{\rho,\sigma} \to \Gamma_{\rho,\sigma} \to 1 \tag{40}$$

[i3]

[d5] [p. 509]

Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

140-3-s510-I003 *insertion. Manuscript:*

$$\begin{aligned} L_0 &\longrightarrow S\Gamma'_{\rho,\sigma} \\ \ell &\longmapsto (\ell, 1, 1) \end{aligned} \tag{39}$$

and we have exact sequence

$$1 \to L_0 \to S\Gamma'_{\rho,\sigma} \to \Gamma_{\rho,\sigma} \to 1 \tag{40}$$

Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

140-3-s510-D005 *deletion. Manuscript:* • Let us now put

$$\begin{array}{c} M_{\rho,\sigma} \subset \mathrm{Aut}(\mathcal{C}) \\ \| \text{ dfn} \\ \left\{ u \;\middle|\; \begin{array}{l} \text{a)}|1°) \; u \textit{ which} \text{ fixes the conjugacy classes of } \rho, \sigma \text{ in } \mathcal{C}, \\ \quad \text{i.e. } \exists \alpha_0, \beta_0 \in \mathcal{C} \text{ such that with } \; u(\rho) = \mathrm{int}(\alpha_0)\rho, \quad u(\sigma) = \mathrm{int}(\beta_0)\sigma, \\ \text{b)}|2°) \; u \text{ fixes the conjugacy class of } L_0, \\ \quad \text{i.e. } \exists f \in \mathcal{C} \text{ such that } u(L_0) = \mathrm{int}(f^{-1}).L_0, \\ \quad \text{i.e. } fu \in \mathrm{Norm}_{\mathrm{Aut}(\mathcal{C})}(L_0) \end{array} \right\} \end{array} \tag{39}$$

hence by definition of

$$\mathcal{T}|\Gamma_{\rho,\sigma} \overset{\text{dfn}}{=} Z_\rho \times_{\Gamma_{\rho,\sigma}} Z_\sigma \tag{41}$$

hence

$$1 \to SZ_\rho \times SZ_\sigma \to \mathcal{T}|\Gamma_{\rho,\sigma} \overset{\delta_{\mathcal{T}}}{\to} \Gamma_{\rho,\sigma} \to 1 \tag{42}$$

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

Scans 511–529

[scan 511]

[p. 558]

$$\begin{aligned} L_0 &\longrightarrow S\Gamma^0_{\rho,\sigma} \subset B_{\rho,\sigma} \times Z_\rho \times Z_\sigma \\ \ell &\longmapsto (\ell, 1, 1) \end{aligned} \tag{40}$$

and the action of L_0 by left translation on $S\mathcal{T}'_{\rho,\sigma}|S\Gamma'_{\rho,\sigma}$ becomes, by (39), the action on $S\mathcal{G}|\mathcal{G}_{\rho,\sigma}$ given by

$$(\alpha, \beta) \longmapsto (\ell\alpha, \ell\beta). \tag{41}$$

Let us therefore set m1173

Marginal note. m1173 denoted $\Gamma|\mathcal{T}^0_{\rho,\sigma}$ in § 48, $\overline{\underline{\text{IX}}}$ #.

$$\Gamma^0_{\rho,\sigma} \overset{\text{dfn}}{=} S\Gamma^0_{\rho,\sigma}/\operatorname{Im} L_0 \simeq Z_\rho \times_{\gamma_{\rho,\sigma}} Z_\sigma, \tag{42}$$

we find that (39) induces a canonical bijection

$$\Gamma^0_{\rho,\sigma} \xrightarrow{\sim} L_0\backslash S\mathcal{G}|\mathcal{G}_{\rho,\sigma} \tag{43}$$

d6

Setting

$$\begin{cases} \dot{SZ}_\rho \overset{\text{dfn}}{=} \operatorname{Ker}(Z_\rho \longrightarrow \Gamma_{\rho,\sigma}) = \operatorname{Centr}_{\mathcal{G}}(\rho) \\ SZ_\rho = \operatorname{Ker}(Z_\rho - \Gamma_{\rho,2|\sigma}) = \operatorname{Centr}_{\mathcal{G}}(\sigma) \end{cases} \tag{44}$$

m1174

Marginal note. m1174 also introduce $S\Gamma_{\rho,\sigma} = \operatorname{Ker}(\Gamma_{\rho,\sigma} \longrightarrow \gamma_{\rho,\sigma})$, $SG_{\rho,\sigma} = \operatorname{Ker}(G_{\rho,\sigma} \longrightarrow \gamma_{\rho,\sigma}) = \mathcal{G}_{\rho,\sigma} = \mathcal{G}$.

we thus have exact sequences

$$\begin{cases} 1 \text{ — } SZ_\rho \to Z_\rho \text{ — } \Gamma_{\rho\sigma|\rho,\sigma} \text{ — } 1 \\ 1 \text{ — } SZ_\sigma \text{ — } Z_\sigma \text{ — } \Gamma_{\rho,\sigma} \text{ — } 1 \end{cases}, \tag{45}$$

and the expressions (37), (42) for $S\Gamma^0_{\rho,\sigma}$, $\Gamma^0_{\rho,\sigma}$ give

$$1 \to L_0 \times SZ_\rho \times SZ_\sigma \text{ — } S_0\Gamma^0_{\rho,\sigma} \text{ — } \gamma_{\rho,\sigma} \text{ — } 1 \tag{46}$$

$$1 \to SZ_\rho \times SZ_\sigma \to \Gamma^0_{\rho,\sigma} \text{ — } \gamma_{\rho,\sigma} \to 1\ . \tag{47}$$

N.B. In the case $\mathcal{G} = \mathrm{Sl}(2, \widehat{\mathbb{Z}})$, ρ and σ "modular", we recover d14 the $S_0\Gamma^{04|\#}_{\rho,\sigma}$ and $\Gamma^0_{\rho,\sigma}$ of § 48 $\overline{\text{IX}}$.

[scan 512]

[p. 559]

Now let

$$S_0 M^{0*}_{\rho,\sigma} \subset S\Gamma^0_{\rho,\sigma} \times G_{\rho,\sigma} \quad (\subset B_{\rho,\sigma} \times Z_\rho \times Z_\sigma \times G_{\rho,\sigma})$$
$$\overset{\text{dfn}}{=}$$
$$\left\{ (u,a,b,U) \,\middle|\, \underbrace{\delta_B(u) = \delta_\rho(a) = \delta_\sigma(b) = \delta_G(U)}_{\text{relation in } \gamma_{\rho,\sigma} \text{ cf. (17)}} \right\} \tag{49}$$

$$M^0_{\rho,\sigma} \subset T_\rho \times T_\sigma \times G_{\rho,\sigma}$$
$$\overset{\text{dfn}}{=}$$
$$\left\{ (a,b,U) \,\middle|\, \underbrace{\delta_\rho(a) = \delta_\sigma(b) = \delta_G(U)}_{\text{relations in } \gamma_{\rho,\sigma}} \right\} \tag{50}$$

We thus have a canonical homomorphism

$$\begin{array}{ccc} SM^0_{\rho,\sigma} & \longrightarrow & M^0_{\rho,\sigma} \\ (u,a,b,U) & \longrightarrow & (a,b,U) \end{array} \tag{51}$$

whose kernel consists of the $(u,1,1,1)$ where $u \in B_{\rho,\sigma}$ is such that $\delta_B(u) = 1$ i.e. $u \in L_0$, whence an exact sequence

$$1 \text{ — } L_0 \to SM^0_{\rho,\sigma} \to M^0_{\rho,\sigma} \text{ — } 1 \tag{52}$$

and canonical homomorphisms

$$\begin{array}{ccc} & \overset{\Theta_G}{\nearrow} & G_{\rho,\sigma} \\ M^0_{\rho,\sigma} & \overset{\Theta_\rho}{\longrightarrow} & Z_\rho \\ & \underset{\Theta_\sigma}{\searrow} & Z_\sigma \end{array} \tag{53}$$

$$\left(\text{resp.} \quad \begin{array}{ccc} & \nearrow & U \\ (a,b,U) & \mapsto & a \\ & \searrow & b \end{array} \right),$$

giving back the analogous homomorphisms on $SM^0_{\rho,\sigma}$ by composition with (41), and moreover we have a canonical homomorphism

$$\begin{array}{ccc} SM^0_{\rho,\sigma} & \overset{\Theta_B}{\longrightarrow} & B_{\rho,\sigma} \\ (u,a,b,U) & \longmapsto & u \end{array} . \tag{54}$$

[p. 511]

Apparatus for this scan

140-3-s512-D001 *deletion. Manuscript:* $\mathcal{T}$
Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 513]

We also have [d1] the interpretation

$$S_0 M^0_{\rho,\sigma} \simeq M^0_{\rho,\sigma} \times_{\gamma_{\rho,\sigma}} B_{\rho,\sigma}; \tag{55}$$

($S_0 M^0_{\rho,\sigma}$ is expressed in terms of $M^0_{\rho,\sigma}$ and $B_{\rho,\sigma}$, and we see that the extension of $M_{\rho,\sigma}$ by L_0 is the inverse image of the extension $B_{\rho,\sigma}$ of $\gamma_{\rho,\sigma}$ by L_0. And we have

$$M^0_{\rho,\sigma} \simeq \underbrace{Z_\rho \times_{\gamma_{\rho,\sigma}} Z_\sigma}_{\Gamma^0_{\rho,\sigma}} \times_{\gamma_{\rho,\sigma}} G_{\rho,\sigma}. \tag{56}$$

whence we deduce (since $\delta_\rho, \delta_\sigma, \delta_G$ are epimorphisms)

$$1 \to \underbrace{SZ_\rho \times SZ_\sigma \times \mathcal{G}}_{\overset{\text{dfn}}{=} M^{0+}_{\rho,\sigma}} \to M'_{\rho,\sigma} | M^0_{\rho,\sigma} \overset{\delta_M^{\#|*}}{\to} \gamma_{\rho,\sigma} \to 1 \tag{57}$$

where we have [d4] (44)

$$\begin{cases} SZ_\rho = Z_\rho \cap \mathcal{G} = \underset{\mathcal{G}}{\text{Centr}} \ (\rho) \\ SZ_\sigma = Z_\sigma \cap \mathcal{G} = \underset{\mathcal{G}}{\text{Centr}} \ (\sigma) \end{cases}$$

Similarly we have

$$S_0 M^0_{\rho,\sigma} \simeq \underbrace{B_{\rho,\sigma} \times_{\gamma_{\rho,\sigma}} Z_\rho \times_{\gamma_{\rho,\sigma}} Z_\sigma}_{S_0 \Gamma^0_{\rho,\sigma}} \times_{\gamma_{\rho,\sigma}} G_{\rho,\sigma} \tag{49}$$

whence we have a canonical exact sequence

$$1 \to L_0 \times SZ_\rho \times SZ_\sigma \times \mathcal{G} \to S_0 M^0_{\rho,\sigma} \to \Gamma_{\rho,\sigma} \text{ — } 1 \tag{50}$$

Let us consider the canonical homomorphism

$$\begin{array}{ccc} \mathcal{G} & \xrightarrow{i_{\mathcal{G}}} & M^0_{\rho,\sigma} \\ & , & \\ U & \longmapsto & (1,1,U) \end{array} \tag{51}$$

[scan 514]

[p. 560]

its image is the third factor in the kernel of (57), and we have a canonical exact sequence (deduced from (56)–(57))

$$1 \to \underset{\substack{\text{sometimes denoted}\\ \mathcal{G}_{\rho,\sigma}?}}{\mathcal{G}} \to M^0_{\rho,\sigma} \to \Gamma^0_{\rho,\sigma} \text{ — } 1 \tag{52}$$

m1175

Marginal note. m1175 (53′)

$$1 \to SZ_\rho \times SZ_\sigma \to M^0_{\rho,\sigma} \to G|G_1 \text{ — } 1$$

and similarly we have (via (49) or 50))

$$\begin{cases} (53) \quad 1 \to \mathcal{G} \to S_0 M^0_{\rho,\sigma} \to S_0 \Gamma^0_{\rho,\sigma} \to 1 \ . \\ \text{Let us consider the map} \\ \qquad S_0 M^0_{\rho,\sigma} \longrightarrow \mathcal{G} \times \mathcal{G} \times \mathcal{G} \\ (54) \\ \qquad \{u, a, b, U\} \longmapsto (ua^{-1}, ub^{-1}, uU^{-1}) = (\alpha, \beta, f) \end{cases}$$

we see d3 by the corollary on page 557 (cf. (37)) that this induces a bijection

$$S_0 M^0_{\rho,\sigma} \simeq (S\mathcal{G}|\mathcal{G}_{\rho,\sigma}) \times \mathcal{G}. \tag{55}$$

We thus have, for an $x \in S_0 M^0_{\rho,\sigma}$, on the one hand the quantities

$$\begin{array}{cccc} u, & a, & b, & U \\ \cup & \cup & \cup & \cup \\ B_{\rho,\sigma} & Z_\rho & Z_\sigma & G_{\rho,\sigma} \end{array} , \tag{56}$$

associated, on the other hand the elements

$$\alpha, \beta, f, \quad \zeta|\xi, \eta, \quad \alpha_0\ \beta_0, g, h \qquad \text{all } \in \mathcal{G} \tag{57}$$

where (α, β, f) i2 defined in terms of (56) in (54), and where we have set

$$\begin{cases} \zeta = \alpha\rho(\alpha)^{-1}, \quad \eta = \beta\sigma(\beta)^{-1}, \quad \alpha_0 = f^{-1}\alpha\#|\zeta, \quad \beta_0 = f^{-1}\beta, \\ g = \alpha_0\rho(\alpha_0)^{-1} = f^{-1}\zeta\rho(f), \quad h = \beta_0\sigma(\beta_0)^{-1} = f^{-1}\eta\sigma(f) \end{cases} \tag{58}$$

[p. 513]

Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

[scan 515]

We will have, in terms of α, β, f, the following expressions for the action of U on $\mathcal{G}$:

$$\begin{cases} U(\rho) = \mathrm{int}(f^{-1}\alpha)\rho = \mathrm{int}(f^{-1})(\zeta\rho) \\ U(\sigma) = \mathrm{int}(f^{-1}\beta)(\sigma) = \mathrm{int}(f^{-1})(\eta\sigma). \end{cases} \tag{59}$$

d3

Remark|Remark Finally, in all these developments, we have not really used the so-called "fundamental hypothesis" (20), [d5] except part a). In the absence of b), one should introduce

$$\begin{array}{c} \Sigma^{\mathrm{eff}}_{\rho,\sigma} \subset \Sigma_{\rho,\sigma} \subset \mathcal{G} \times \mathcal{G} \\ \| \\ \left\{(\zeta,\eta) \in \mathcal{G}|\Sigma_\rho \times \mathcal{G} \mid \exists u \in B_{\rho,\sigma},\ u(\rho) = \zeta\rho,\ u(\sigma) = \eta\sigma\right\}, \end{array} \tag{60}$$

which is thus nothing other than the image of the map (9): effective pairs (ζ, η) satisfying the conditions defining [d6]$\Sigma_{\rho,\sigma}$ (cf. (8))[i1])

d7

let us write

$$\begin{array}{rl} S\mathcal{G}|\mathcal{G}^{\mathrm{eff}}_{\rho,\sigma} = & \text{Inverse image of } \Sigma^{\mathrm{eff}}_{\rho,\sigma} \\ & \text{under } S\mathcal{G}|\mathcal{G}_{\rho,\sigma} \longrightarrow \Sigma_{\rho,\sigma} \quad (28), \end{array} \tag{61}$$

then|by bijection|bis

[d8] and it is on $S\mathcal{G}|\mathcal{G}^{\mathrm{eff}}_{\rho,\sigma}$ that we will have a structure

[scan 517]
m1177

Marginal note. m1177 introduce it by equivalent conditions:
a)

$$M'^{\sim}_{0,3}[0] \longrightarrow \Sigma^{\text{eff}}_{\rho,\sigma}$$

all
b) $\forall u \in M'^{\sim}_{0,3}$, $\exists u_{\mathcal{G}} \in \operatorname{Aut}\mathcal{G}$ such that $u_{M|\mathcal{G}} \circ \psi = \psi \circ u$
b') Idem with $u \in M'^{\sim}_{0,3}[0]$
c) $\exists \psi_M$ which extends ψ
c') $\exists \psi_G$ which extends ψ
We will therefore say that d1 automatic|automorphism
ψ is effective if (20) b) satisfied

Definition We will say that ψ is effective if for every $u \in M'^{\sim}_{0,3}[0]$, putting $u(\rho) = \zeta\rho$, $u(\sigma) = \eta\sigma$,

$$(\zeta_{\mathcal{G}}, \eta_{\mathcal{G}}) = (u(\zeta), u(\eta)) \in \Sigma_{\rho,\sigma}$$

effective (i.e. $\in \Sigma^{\text{eff}}_{\rho,\sigma}$, i.e. $\exists u_{\mathcal{G}}$ automorphism $\mathcal{G}$ such that we have d2

$$(69) \qquad u_{\mathcal{G}}(\rho_{\mathcal{G}}) = \zeta_{\mathcal{G}}\rho_{\mathcal{G}}, \qquad u_{\mathcal{G}}(\sigma_{\mathcal{G}}) = \eta_{\mathcal{G}}\sigma_{\mathcal{G}}$$

or, what amounts to the same thing, that we have commutativity in

$$\begin{array}{ccc} \mathcal{G}_{0,3}^{+\wedge} & \xrightarrow{u} & \mathcal{G}_{0,3}^{+\wedge} \\ {\scriptstyle\psi}\downarrow & & \downarrow{\scriptstyle\psi} \\ \mathcal{G} & \xrightarrow[u_{\mathcal{G}}]{} & \mathcal{G} \end{array} \qquad (70).$$

(Thus to say that this is the case for every $u \in M_{0,3}'^{\sim}$ means that these u transform $\operatorname{Ker}\psi$ into itself — or also, that $M_{0,3}'^{\sim}$ $(= M_{0,3}'^{\sim}[0].\mathcal{G}_{0,3}^{+\wedge})$ in its entirety stabilizes $\operatorname{Ker}\psi$. [d5] This condition is therefore automatically fulfilled when $\mathcal{G}, \rho_{\mathcal{G}}, \sigma_{\mathcal{G}}$ satisfy the condition|the conditions b) of (20).

We have done what was needed to have the [p. 516]

[scan 518]

[p. 562]

Theorem Let $\psi = \psi_{\mathcal{G}} : \mathcal{G}_{0,3}^{+\wedge} \longrightarrow \mathcal{G}$ be an effective surjective homomorphism (cf. above). Then there exists a unique homomorphism

$$(71) \qquad \psi_M : M_{0,3}'^{\sim} \longrightarrow M^0_{\rho_{\mathcal{G}},\sigma_{\mathcal{G}}}$$

d4

d5

m1178

Marginal note. [m1178] In fact, we have of course in the first place a homomorphism

$$S_0 M_{0,3}'^{\sim} \longrightarrow S_0 M^0_{\psi}.$$

having the following property: if [d8] $u = \,| \in M_{0,3}'^{\sim}$ is of the form $u_{\alpha,\beta,f}$ $(\alpha, \beta, f \in \mathcal{G}_{0,3}^{+\wedge}$, satisfying the loop equation $\alpha\rho(\alpha)^{-1} = \beta\sigma(\beta)^{-1}\ell_1^{\nu})$, then $\psi_M(u)$ is the element of [d9] M^0_{ψ} defined by the invariants $\psi(\alpha), \psi(\beta); \psi(f)$.

Corollary We then have homomorphisms of exact sequences

$$\begin{array}{ccccccccc} 1 & \to & \mathcal{G}^{+\wedge}_{0,3} & — & M'^{\sim}_{0,3} & \to & \Gamma'^{\sim}_{\mathbb{Q}} & \to & 1 \\ & & \downarrow{\scriptstyle \psi_{\mathcal{G}}} & & \downarrow{\scriptstyle \psi_M} & & \downarrow{\scriptstyle \psi_{\mathcal{T}}|\psi_\Gamma} & & \\ 1 & \longrightarrow & \mathcal{G} & \longrightarrow & M^0_\psi & \longrightarrow & \Gamma^0_\psi & \to & 1 \end{array} \qquad (72).$$

(The homomorphism ψ_M is made explicit by means of three homomorphisms [p. 517]

[scan 520]

[p. 563]

. We can regard all this as a statement of functoriality of the constructions made, with respect to a surjective homomorphism

$$\mathcal{G} \xrightarrow{\varphi=\varphi_{\mathcal{G}}} \mathcal{G}' \qquad (81)$$

m1180

Marginal note. m1180 It would have been better to take then

$$\mathcal{G}' \xrightarrow{\varphi} \mathcal{G}$$

, in order to be able to specialize to $\mathcal{G}'$

transforming the pair (ρ, σ) of topological generators of $\mathcal{G}$ into a pair (ρ', σ'). There is then a unique homomorphism

$$S_0 M^0_{\mathcal{G}} \xrightarrow{\varphi_{M^0}} S_0 M^0_{\mathcal{G}'} \qquad (82)$$

satisfying the following conditions:
m1181

Marginal note. m1181 this shows that φ_{SM} is determined when we know the four homomorphisms $\varphi_B, \varphi_\rho, \varphi_\sigma, \varphi_G$

a) $\varphi_M|\varphi_{SM}$ passes to quotients as|to homomorphisms

$$\begin{cases} \varphi_B : B_{\rho,\sigma} \longrightarrow Z_{\rho,\sigma}|\Sigma_{\rho,\sigma} \\ \varphi_\rho : Z_\rho \longrightarrow Z_{\rho'} \\ \varphi_\sigma : Z_\sigma \text{ — } Z_{\sigma'} \\ \varphi_G : G_{\rho,\sigma} \text{ — } G_{\rho',\sigma'} \end{cases} ; \qquad (83)$$

b) d1 d2i1

$$(84) \quad \begin{cases} \varphi_G \qquad \text{(which shows that knowledge} \\ \text{[illeg. 1] of } \varphi_{SM} \text{ } b|se \text{ amounts to that of } \varphi_G); \end{cases}$$

c) We have commutativity in

$$\begin{array}{ccc} \mathcal{G} & \longrightarrow & G_{\rho,\sigma} \\ {\scriptstyle \varphi=\varphi_{\mathcal{G}}}\downarrow & & \downarrow{\scriptstyle \varphi_G} \\ \mathcal{G}' & \longrightarrow & G_{\rho',\sigma'} \end{array} \qquad (85)$$

(which shows, since $G_{\rho,\sigma} = B_{\rho,\sigma} \cdot \mathcal{G}$, that φ_G is known when we know φ_B;
d) For $u \in B_{\rho,\sigma}$, d4 putting $u' = \varphi_B(u)$i2, we have commutativity in

$$\begin{array}{ccc} \mathcal{G} & \xrightarrow{u} & \mathcal{G} \\ {\scriptstyle \varphi_{\mathcal{G}}}\downarrow & & \downarrow{\scriptstyle \varphi_{\mathcal{G}}} \\ \mathcal{G}' & \xrightarrow{u'} & \mathcal{G}' \end{array} \qquad (86)$$

[p. 519]

[scan 521]

– (which determines φ_B in terms of $\varphi = \varphi_{\mathcal{G}}$, thus this|it determines $\varphi_{S_0 M}$, and by passage to the quotient, also

$$\varphi_M : M_{\rho,\sigma} \longrightarrow M_{\rho',\sigma'}. \tag{87}$$

Another way, more direct, of describing $\varphi_{S_0 M^0}$ or φ_M, in terms of the d1 "parameters"i1 (α, β, f) instead of the (u, a, b, U), is to say that one d2 transforms a $u_{\alpha,\beta,f}$ into the $u_{\alpha',\beta',f'}$, where α', β', f' are the images of α, β, f under φ:

$$\varphi_{S_0 M_0 | M^0}\left(\underbrace{u_{\alpha,\beta,f}}_{\in S_0 M^0_{\rho,\sigma}}\right) = u_{\alpha',\beta',f'}, \qquad \begin{cases} \alpha' = \varphi(\alpha), \\ \beta' = \varphi(\beta), \\ f' = \varphi(f). \end{cases} \tag{88}$$

We thus recover, in a slightly more precise form, the preceding theorem, by d4 applying it to the case where $\mathcal{G} = \mathcal{G}_{0,3}^{+\wedge}$ (the "universal case")*, $\mathcal{G}'$ arbitrary — it is better in the notation (81) to interchange the role of $\mathcal{G}$ and $\mathcal{G}'$. m1182

Marginal note. m1182 * at least "universal" with respect to the additional hypothesis $\rho^3 = 1,\ \sigma^2 = 1$ in $\mathcal{G}$.

It is good to d5make explicit the essential invariantsi2 (in the "universal" case:
d6

$$\begin{aligned} &\mathcal{G}' = \mathcal{G}_{0,3}^{+\wedge}, \qquad B'_{\rho',\sigma'} = M'^{\sim}_{0,3}[0], \qquad \gamma'^{|0}_{\rho',\sigma'} = \Gamma'^{\sim}_{\mathbb{Q}}, \\ &G'^{|0}_{\rho',\sigma'} = M'^{\sim}_{0,3}, \qquad Z'_\rho = M'^{\sim}_{0,3}\left(-\frac{1}{3}\right) \mid \left(\frac{1}{3}\right), \qquad Z'_\sigma = M'^{\sim}_{0,3}\left(\frac{1}{2}\right) \mid \left(-\frac{1}{2}\right), \\ &\Gamma'_{\rho',\sigma'} = \Gamma'^{\sim}_{\mathbb{Q}} \quad . \end{aligned} \tag{90}$$

$$(91)|(92) \qquad S_0 M'_{\rho',\sigma'} \simeq S_0 M'^{\overset{S_0 G'_{\rho',\sigma'} \simeq |=}{\sim}}_{0,3}, \quad M'_{\rho',\sigma'} \overset{\sim}{\to} M'^{\overset{G'_{\rho',\sigma'} \overset{\sim}{\to}}{\sim}}_{0,3}.$$

m1183

Marginal note. m1183 hence

$$(92) \quad \begin{cases} SZ'_{\rho'} = SZ'_{\sigma'} \\ \qquad = S\Gamma|\mathcal{T}'_{\rho',\sigma'} = 1 \end{cases} \quad (cf.) \text{ of } (92)$$

Remark In writing the relations (86), it became evident that the notations used in this section II (from page 0 553') were inadequate, and that they should be modified as follows: m1184

Marginal note. m1184 This had been suggested to me in the case $\mathcal{G} = \mathrm{Sl}(2, \widehat{\mathbb{Z}})$, modular pair ρ, σ which does not come from $\mathcal{G}^{+\wedge}_{0,3}$, because of the $\{\pm 1\}$! but in this case [illeg. 1] universal, should have served me as a guiding thread for my notations.

$$(93) \qquad \begin{array}{l} \Sigma_{\rho,\sigma},\ B_{\rho,\sigma},\ \overset{S_0 G_{\rho,\sigma},}{G_{\rho,\sigma}}\ ,\ \gamma_{\rho,\sigma},\ ,\ Z_\rho,\ Z_\sigma,\ \mathcal{G}_{\rho,\sigma},\ S\mathcal{G}_{\rho,\sigma} \\ Z_\rho,\ Z_\sigma,\ S_0\Gamma^0_{\rho,\sigma},\ \Gamma^0_{\rho,\sigma},\ SZ_\rho,\ SZ_\sigma,\ S_0M^0_{\rho,\sigma},\ M^0_{\rho,\sigma}. \end{array}$$

We put a prime $'$ everywhere to make them $\Sigma'_{\rho,\sigma}$, $B'_{\rho,\sigma}$ etc, and we remove the exponent ^{0} from $S_0\Gamma^0_{\rho,\sigma}$, $\Gamma^0_{\rho,\sigma}$, $S_0M^0_{\rho,\sigma}$, $M^0_{\rho,\sigma}$ (which is thus replaced by a $'$).

Other important special cases to make explicit:

2°) $\mathcal{G} = \mathrm{Sl}(2, \widehat{\mathbb{Z}})/\pm 1$, (ρ, σ) modular pair.

$$(94) \qquad \left\{ \begin{array}{l} B'_{\rho,\sigma} \simeq \left\{ \begin{pmatrix} \mu & \lambda \\ 0 & 1 \end{pmatrix} \mid \mu \in \widehat{\mathbb{Z}}^*,\ \mu \equiv 1\ (3),\ \lambda \in \widehat{\mathbb{Z}} \right\} \\ \quad L_0 = \left\{ \begin{pmatrix} 1 & \lambda \\ 0 & 1 \end{pmatrix} \mid \lambda \in \widehat{\mathbb{Z}} \right\} \\ \\ G'_{\rho,\sigma} \simeq \mathrm{Gl}'(2, \widehat{\mathbb{Z}})/\pm 1, \quad \text{where} \quad \mathrm{Gl}'(2, \widehat{\mathbb{Z}}) \overset{\text{dfn}}{=} \{u \in \mathrm{Gl}(2, \widehat{\mathbb{Z}}) \mid \det u \equiv 1\ (3)\} \\ \\ Z'_\rho = \{c\rho + d \mid c^2 + cd + d^2 \in \widehat{\mathbb{Z}}^*\}/\pm 1 \\ \quad \simeq T_\rho | \mathcal{T}_\rho(\widehat{\mathbb{Z}})/\mu_2(\mathbb{Z}) \\ \\ Z'_\sigma = \\ \quad N'_\sigma(\widehat{\mathbb{Z}})/\mu_2(\mathbb{Z}) \quad \text{with notations of §48} \\ S_0M'_{\rho,\sigma} \simeq SM''_{\rho,\sigma} | SM'_{\rho,\sigma}(\widehat{\mathbb{Z}})/\Sigma \quad \text{with notations of §48} \\ M'_{\rho,\sigma} \simeq M'_{\rho,\sigma}(\widehat{\mathbb{Z}})/\Sigma \quad \text{id} \\ \Gamma'_{\rho,\sigma} \simeq \mathcal{T}'_{\rho,\sigma}(\widehat{\mathbb{Z}})/\Sigma_0 \quad \text{with notations of §48} \end{array} \right.$$

III The group $M_{\rho,\sigma}|M_\rho$
Let us consider the homomorphisms
(1)

$$\widehat{\mathbb{Z}} \xrightarrow[n\mapsto\sigma^n]{n\mapsto\rho^n} \mathcal{G} \xrightarrow[n\mapsto\epsilon_0^n]{} \mathcal{G}$$

with image $L_0^{\mathcal{G}}$

$$\widehat{\mathbb{Z}} \longrightarrow \mathcal{G}$$

$$n \longmapsto \epsilon_0^n$$

where $\epsilon_0 = \sigma^{-1}\rho$ (with image $L_0^{\mathcal{G}}$)
and let J be the intersection of the the kernels, in such a way that the image (1), factors through a

$$(2) \qquad (\widehat{\mathbb{Z}}^*/J)^* \simeq \mathrm{Aut}(L_0^{\mathcal{G}}).$$

We have thus an obvious homomorphism

$$(3) \qquad B'_{\rho,\sigma} \longrightarrow \mathrm{Aut}\, L_0^{\mathcal{G}} \simeq (\widehat{\mathbb{Z}}/J)^*$$

trivial on L_0, i.e. factors which gives a corresponding homomorphism

$$(4) \qquad \gamma'_{\rho,\sigma} \xrightarrow{\chi_\gamma} (\widehat{\mathbb{Z}}/J)^*,$$

hence on composing with $G'_{\rho,\sigma} \longrightarrow \gamma'_{\rho,\sigma}$

$$(4\text{bis}) \qquad G'_\rho \xrightarrow{\chi_G} (\widehat{\mathbb{Z}}/J)^*.$$

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 524]
[p. 565]

III d1

Let us consider the extension $\mathrm{Gl}(2,\mathbb{Z})^{\wedge}$ of $\mathcal{G}^{\wedge}_{0,3}$ by $\{\pm 1\}$:

(1)

$$\begin{array}{ccccccccc}
 & & & & 1 & & 1 & & \\
 & & & & \downarrow & & \downarrow & & \\
1 & \longrightarrow & \{\pm 1\} & \longrightarrow & \mathrm{Sl}(2,\widehat{\mathbb{Z}}) & \longrightarrow & \mathcal{G}^{+\wedge}_{0,3} & \longrightarrow & 1 \\
 & & \| & & \downarrow & & \downarrow & & \\
1 & \longrightarrow & \{\pm 1\} & \longrightarrow & \mathrm{Gl}(2,\widehat{\mathbb{Z}}) & \longrightarrow & \mathcal{G}^{\wedge}_{0,3} & \longrightarrow & 1 \\
 & & & & \downarrow & & \downarrow & & \\
 & & & & \{\pm 1\} & \longrightarrow & \{\pm 1\} & & \\
 & & & & \downarrow & & \downarrow & & \\
 & & & & 1 & & 1 & &
\end{array}$$

We are interested in the group $N^{\sim}_{1,1}$, defined extension of $M^{\sim}_{0,3}$ by $\{\pm 1\}$,[i1] as the inverse image of the extension $\mathrm{Gl}(2,\widehat{\mathbb{Z}})$ of $\mathrm{Gl}(2,\widehat{\mathbb{Z}})/\pm 1$ by $\{\pm 1\}$, via the canonical homomorphism

$$(2) \qquad M^{\sim}_{0,3} \longrightarrow \mathrm{Gl}(2,\widehat{\mathbb{Z}})' = \mathrm{Gl}(2,\widehat{\mathbb{Z}})/\pm 1$$

(cf. §45 page…), so that we find a homomorphism of exact sequences, d6

(3)

$$\begin{array}{ccccccccc}
1 & \longrightarrow & \{\pm 1\} & \longrightarrow & N^{\sim}_{1,1}|N^{\sim}_{0,3} & \longrightarrow & M^{\sim}_{0,3} & \longrightarrow & 1 \\
 & & \| & & \downarrow & & \downarrow & & \\
1 & \longrightarrow & \{\pm 1\} & \longrightarrow & \mathrm{Gl}(2,\widehat{\mathbb{Z}}) & \longrightarrow & \mathrm{Gl}(2,\widehat{\mathbb{Z}})' & \longrightarrow & 1
\end{array}$$

We find, d12 a[i2] as the inverse image of $\mathcal{G}^{+\wedge}_{0,3} \subset$ d14 $M^{\sim}_{0,3}$ in $N_{1,1}$, a $\mathrm{Gl}(2,\mathbb{Z})^{\wedge}$, deduc- m1186

Marginal note. m1186 N.B. $\mathcal{T}_{1,1} \simeq \mathrm{Gl}(2,\mathbb{Z})_{\wedge}|\mathrm{Gl}(2,\mathbb{Z})$.

Scans 530–548

[scan 530]

[p. 568] IV d1

So let $\mathcal{G}$ be a profinite group, equipped with the|with generators[i1] $\rho, \sigma \in \mathcal{G}$ satisfying the relations

$$(1) \qquad \rho^6 = \sigma^4 = 1, \qquad \rho^3 = \sigma^2 \quad (\overset{\text{dfn}}{=} \text{“}-1\text{”}).$$

m1191

Marginal note. m1191 This simply means that we give ourselves a surjective homomorphism

$$\mathrm{SL}(2, \mathbb{Z})^\wedge \longrightarrow \mathcal{G}$$

A particularly interesting case is the one where $\rho^3 = \sigma^2 = 1$, to which nevertheless I would not wish to limit myself. Let τ be an automorphism of $\mathcal{G}$ satisfying

$$(2) \qquad \tau(\sigma) = \begin{matrix} \sigma^{-1} \\ = -\sigma \end{matrix}, \qquad \tau(\rho) = \sigma(\rho^{-1})$$

m1192

Marginal note. m1192 Let us introduce d3 right away the equivalent element $\tau' = \sigma^{-1}\tau$ satisfying $\tau'(\rho) = \rho^{-1}$, $\tau'(\sigma) = \sigma^{-1}$ $(\tau'(\varepsilon_0) = \varepsilon_1^{-1}, \tau'(\varepsilon_1) = \varepsilon_0^{-1})$.

(which means that τ_∞ “passes to the quotient” as an automorphism τ of $\mathcal{G}$), which implies

$$(3) \qquad \tau^2 = 1$$

$$(4) \qquad \tau(\varepsilon_0) = \varepsilon_0^{-1}, \qquad \tau(\varepsilon_1) = \varepsilon_1^{-1}, \qquad \text{where}$$

$$(5) \qquad \begin{matrix} \varepsilon_0 = \sigma\rho \\ = -\sigma^{-1}\rho \end{matrix}, \qquad \varepsilon_1 = \rho\sigma = \sigma(\varepsilon_0) = \sigma^{-1}(\varepsilon_0) = \rho(\varepsilon_0).$$

m1193

Marginal note. m1193 of the formula forgotten a sign $-$, whereas we could from the outset|ask simply give|take $\varepsilon_0 = \sigma_\infty | \sigma^{-1}\rho$ ...

Put

$$(5) \qquad \mathcal{G}' = \{1, \tau\} \,.\, \mathcal{G},$$

so we have

$$(6) \qquad 1 \longrightarrow \mathcal{G} \longrightarrow \mathcal{G}' \longrightarrow \{1, \tau\} \longrightarrow 1.$$

Let d5

$$B_{\rho,\sigma} \subset \mathrm{Aut}(\mathcal{G}) \times \widehat{\mathbb{Z}}^*$$

$$(7) \qquad = \left\{ (u, \mu) \;\middle|\; \begin{array}{l} u(\varepsilon_0) = \varepsilon_0^\mu \\ u(\sigma) \text{ conjugate in } \mathcal{G} \text{ to } \sigma^\mu \\ u(\rho) \quad \text{——————————} \quad \mathcal{G} \text{ to } \rho^\mu \end{array} \right\}.$$

which is obviously a subgroup. The third condition can be made explicit moreover, 529

[scan 531]

since $\rho^6 = 1$ i.e. ρ^μ depends only on the image of μ in

$$(\mathbb{Z}/6\mathbb{Z})^* \simeq (\mathbb{Z}/2\mathbb{Z})^* \times (\mathbb{Z}/3\mathbb{Z})^* \simeq (\mathbb{Z}/3\mathbb{Z})^* \simeq \pm 1,$$

d1 so[i2]

$$\rho^\mu = \rho^{\varepsilon_3(\mu)} \tag{8}$$

that for $\varepsilon_3(\mu) = 1$ [d2] $u(\rho)$ is conjugate to ρ in $\mathcal{G}$, and for $\varepsilon_3(\mu) = -1$ it is conjugate to ρ^{-1} in $\mathcal{G}$, or again to ρ by an element of $\mathcal{G}'$ – i.e. an element of the form $\alpha_1\tau_\infty$ with $\alpha_1 \in \mathcal{G}$ (since $\tau_\infty(\rho) = \sigma(\rho^{-1})$ precisely…). [d3 d4 d5 d6] We see likewise that we have

$$\sigma^\mu = \sigma^{\varepsilon_2(\mu)} \quad \begin{cases} = \sigma & \text{if } \mu \equiv 1 \quad (4) \\ \sigma^{-1} = -\sigma & \text{if } \mu \equiv -1 \quad (4) \end{cases} \tag{9}$$

$$= \varepsilon_2(\mu)\sigma$$

d9

Thus:

Proposition For a|one [d11] $(u, \mu) \in \mathrm{Aut}(\mathcal{G}) \times \widehat{\mathbb{Z}}^*$ to be in $B_{\rho,\sigma}$, it is necessary and sufficient that there exist $\alpha \in \mathcal{G}'$, $\beta \in \mathcal{G}$ such that we have 530

[scan 532]

[p. 569]

$$(10) \qquad u(\rho) = \mathrm{int}(\alpha)(\rho), \qquad u(\sigma) = \underbrace{\varepsilon_2(\mu)}_{\varepsilon} \mathrm{int}(\beta)(\sigma)$$

and finally

$$(11) \qquad u(\varepsilon_0) = \varepsilon_0^{\mu},$$

where in addition we have [d1] i.e. $\alpha \equiv \tau$.

We shall note that [d2](u, μ)[i4] is uniquely determined by μ and[i5] the knowledge of α and[i6] of β, [d3] and even only by μ and

$$(13) \qquad \zeta = \alpha\rho(\alpha)^{-1}, \qquad \eta = \varepsilon_2(\mu)\beta\sigma(\beta)^{-1}$$

since we shall then have u by

$$(14) \qquad u(\rho) = \zeta\rho, \qquad u(\sigma) = \eta\sigma.$$

Moreover, in the case where

$$(15) \qquad \begin{array}{ccc} \widehat{\mathbb{Z}} & \longrightarrow & \mathcal{G} \\ n & \longmapsto & \varepsilon_0^n \end{array}$$

is injective, [d4] μ is determined as a function of u as multiplier of[i7] the action of [d5]u[i8] on $L_0^{\mathcal{G}} \subset \mathcal{G}$, image of (15), so (u, μ) is determined by u so by $(\alpha, \beta, \varepsilon_4 \Leftarrow \mid = \varepsilon_2(\mu))$. Moreover, if $\mathcal{G}$ is a group that maps into $\mathrm{SL}(2, \widehat{\mathbb{Z}})'$ (so as to send ρ, σ to the usual elements), we have seen that α all by itself 531

[scan 533]

already determines μ, so ε, so [d1] [d2] the element of $B_{\rho,\sigma}$ is determined with the help of α, β alone.

But what conditions must (α, β, μ) satisfy to determine an element of $B_{\rho,\sigma}$? First of all, it is necessary that there indeed exist an automorphism u (necessarily[t] unique) satisfying (14) — this is a condition on ζ, η alone.

[d3] We must next express (11). [d4i1] [d5]

Let us introduce

$$\varepsilon_0' = \sigma^{-1}\rho = -\varepsilon_0. \qquad (*)$$

whence

$$\varepsilon_0'^{\,\mu} = (-1)^\mu \varepsilon_0^\mu = -\varepsilon_0^\mu \qquad (\text{since } \mu \equiv 1\ (2))$$

$$u(\varepsilon_0') = -u(\varepsilon_0)$$

since $u(-1) = -1$ cf. below.

so the relation (11) is also equivalent to

$$u(\varepsilon_0') = \varepsilon_0'^{\,\mu}, \qquad (**|*)$$

which, by the same old calculation, is written thus 532

Apparatus for this scan

140-3-s533-D001 *deletion. Manuscript:* (α, β)

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

140-3-s533-D002 *deletion. Manuscript:* determines|all

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

140-3-s533-D003 *deletion. Manuscript:* It remains to express

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

140-3-s533-I001 *insertion. Manuscript:* We must next express (11). we

Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

140-3-s533-D004 *deletion. Manuscript:* we

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

140-3-s533-D005 *deletion. Manuscript:* Next the relation (11) is written, since

$$\varepsilon_0 = \sigma\rho = \text{so} - \sigma^{-1}\rho, \quad \text{so}$$
$$u(\varepsilon_0) = -u(\sigma^{-1})u(\rho) = -(\eta\sigma)^{-1}\zeta\rho = \sigma(\eta^{-1}\zeta)\underbrace{\sigma\rho}_{\varepsilon_0}$$
$$-\sigma^{-1}\eta^{-1}\zeta\underbrace{\rho\sigma^{-1}}\sigma = \sigma^{-1}(\eta^{-1}\zeta\varepsilon_1)$$

in the form

$$\eta^{-1}\zeta\varepsilon_1\sigma(\varepsilon_0)|\sigma\rho = \varepsilon_0^{\mu} \quad \text{i.e.} \quad \zeta$$
$$\zeta\,\sigma(\eta) = \varepsilon_0^{\mu-1}\ (= l_0^{\nu})$$

We shall get from this|We also have, [illeg. 1]

$$\sigma(\eta) = \varepsilon\sigma(\beta\sigma(\beta)^{-1}) = \varepsilon\sigma(\beta)\underbrace{\sigma^2(\beta)^{-1}}_{=\beta^{-1}} = u\varepsilon\sigma(\beta\sigma(\beta)^{-1})^{-1}$$
$$= \varepsilon(\beta\sigma(\beta)^{-1})\eta^{-1}$$

i.e.

$$\rho \quad \eta\sigma(\eta) = u\,1 \tag{16}$$

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 534]

[p. 570]

$$\eta^{-1}\zeta = {\varepsilon_1'}^{2\nu}, \quad \text{where } \nu = (\mu-1)/2, \quad \varepsilon_1' = -\varepsilon_1 = \rho\sigma^{-1}$$

we have

$${\varepsilon_1'}^{2\nu} = (-1)^{2\nu}\varepsilon_1^{2\nu} = \varepsilon_1^{2\nu} = l_1^{\nu},$$

so the relation at the top takes the form

$$\boxed{\zeta = \eta l_1^{\nu}}, \quad \text{where } \nu = (\mu-1)/2. \tag{16}$$

We still have to prove the

Lemma Let u be an automorphism of $\mathcal{G}$ such that $u(\sigma)$ is conjugate in $\mathcal{G}^{i1}$ to σ or σ^{-1}, then

$$\boxed{u(-1) = -1} \tag{17}$$

We will indeed have $u(\sigma) = \text{int}(\alpha)(\sigma')$, where $\sigma' = \sigma$ or $\sigma^{-1\,i2}$, hence

$$u(\sigma^2) = \text{int}(\alpha)({\sigma'}^2) = \text{int}(\alpha)(-1) = -1, \quad \text{OK.}$$

It remains to|: express finally^{i3} that ^{d4} $u(\rho)$= int$(\alpha)\rho$ is conjugate to ρ^{μ}, and $u(\sigma)$ to σ^{μ}, and this is ^{d5} automatic^{i5} for σ, since

$$u(\sigma) = \text{int}(\beta)(\varepsilon_2(\mu)\sigma) = \text{int}(\beta)(\sigma^{\mu}) \quad \text{(by (9))},$$

and for ρ this means that we have

$$\alpha \equiv \tau^{\nu_3(\mu)}\ (\mathcal{G}) \tag{17}$$

which we also write $\tau^{\nu_3(\mu)}\alpha \in \mathcal{G}^{i6}$ where $\nu_3(\mu) \in \mathbb{Z}/2$ is the expression additive form|form of $\varepsilon_3(\mu)$

—

So we have found

Corollary ^{d7} The map

$$B_{\rho,\sigma} \longrightarrow \mathcal{G} \times \mathcal{G} \times \widehat{\mathbb{Z}}^*$$
$$(u,\mu) \longmapsto ([u,\rho],[u,\sigma],\mu) \tag{18}$$

is injective, and it has as its image the set$\Sigma^{\mathrm{eff}}_{\rho,\sigma}$ [i8] of triples (ζ, η, μ) satisfying the following conditions:

$$1^\circ) \quad \zeta\rho \text{ conjugate to } \rho^{\mu} \text{ " } \rho^{\varepsilon_3(\mu)} \text{ in } \mathcal{G}$$

$$2^\circ) \quad \eta|\zeta\sigma \quad \text{_____} \quad \sigma^{\mu} = \sigma^{\varepsilon_2(\mu)} \text{ in } \mathcal{G}$$

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

140-3-s537-D003 *deletion. Manuscript:* Moreover the image of Z_ρ is contained in $\gamma'_{\rho,\sigma}$ if we assume (or equal) sss|iff ρ and ρ^{-1} not conjugate in $\mathcal{G}$, it suffices and for this likewise the image of Z_σ is reduced|reduced to $\gamma''_{\rho,\sigma}$ sss|iff σ and $\sigma^{-1} = -\sigma$ not conjugate in $\mathcal{G}$. Let us note for example that if $\mathcal{G} = \mathrm{SL}(2, \widehat{\mathbb{Z}})'$, $\sigma^2 = 1$, the last condition

is not satisfied, hence $Z_\sigma \longrightarrow \gamma_{\rho,\sigma}$ is surjective, it but it is not either that it is satisfied if $\mathcal{G} = \mathrm{SL}(2,\widehat{\mathbb{Z}})$ in $\mathrm{SL}(2,\widehat{\mathbb{Z}})$ σ is conjugate there to $-\sigma$, by the (for σ and general theorem of Steinberg for example) — can it happen in the universal case $\mathrm{SL}(2,\mathbb{Z})^\wedge = \mathcal{G}_{1,1}^{+\wedge}$?

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

140-3-s537-D014 *deletion. Manuscript:* The condition on ρ is not satisfied for $\mathcal{G} = \mathrm{SL}(2,\widehat{\mathbb{Z}})/\pm 1$, As in this case the two homomorphisms $Z_\rho, Z_\sigma \to \hat{\gamma}_{\rho,\sigma}|\gamma_{\rho,\sigma} = \widehat{\mathbb{Z}}^*$, $Z_\sigma \to \gamma_{\rho,\sigma} = \widehat{\mathbb{Z}}^*$ are surjections|surjective), but it is for $\mathcal{G} = \mathrm{SL}(2,\widehat{\mathbb{Z}})$, for we find that the image of $Z_\rho \to \gamma_{\rho,\sigma}$ is $\gamma'_{\rho,\sigma}$. But in $\mathcal{G}_{0,3}^{+\wedge}$, ρ and ρ^{-1} are also not conjugate, i.e. the image is reduced also to $\gamma'_{\rho,\sigma}$.

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 538]

[p. 572]

Proposition 1°) The image $\delta_\rho(Z_\rho)$ contains $\gamma'_{\rho,\sigma}$, and is [d1] reduced to $\gamma'_{\rho,\sigma}$ iff|iff ρ and ρ^{-1} not conjugate in $\mathcal{G}$ — therefore it is equal to $\gamma_{\rho,\sigma}$ i.e. $\delta_\rho : Z_\rho \longrightarrow \gamma_{\rho,\sigma}$ epimorphism iff|iff ρ and ρ^{-1} are conjugate in $\mathcal{G}$.

2°) The image $\delta_\sigma(Z_\sigma)$ contains $\gamma''_{\rho,\sigma}$, and it is reduced to $\gamma''_{\rho,\sigma}$ iff|iff σ and $\sigma^{-1} = -\sigma$ not conjugate in $\mathcal{G}$ — therefore|otherwise it is equal to $\gamma_{\rho,\sigma}$ i.e. $\delta_\sigma : Z_\sigma \longrightarrow \gamma_{\rho,\sigma}$ epimorphism iff|iff σ and $-\sigma^{-1}|\sigma^{-1} = -\sigma$ are conjugate in $\mathcal{G}$.

Corollary 1. If $\mathcal{G}$ contains as a quotient

$$SL(2,\mathbb{Z}/3\mathbb{Z})', \quad \text{with} \quad \rho = \begin{pmatrix} 0 & 1 \\ -1 & 1 \end{pmatrix}, \qquad \sigma = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}$$

$(\mathrm{mod}\ \pm 1)$, then the image of δ_ρ is $\gamma'_{\rho,\sigma}$.

Indeed, we see that ρ and $\pm\rho^{-1}$ are not conjugate in $\mathcal{G}$, for they are not in $SL(2,\mathbb{Z}/3\mathbb{Z})'$ — [d2] Let us check this:[i1] ρ and $-\rho^{-1}$ already have distinct traces 1 and -1, $\in(\mathbb{Z}/3\mathbb{Z})^*$, they are not conjugate.

We have

$$\underbrace{(\tau\sigma)}_{\tau'_\infty}(\rho) = \rho^{-1},$$

therefore [d3] the elements of [d4] $GL(2,\mathbb{Z}/3\mathbb{Z})$ [d5] which conjugate ρ to ρ^{-1} are of the form $f\tau'_\infty$, where $f = c|b\rho + d$, we want $\det(f\tau'_\infty) = 1$ i.e. $\det(f) = -1$ (since $\det(\tau'_\infty) = -1$), i.e. $c^2 + cd + d^2 = -1$, impossible. 537

[scan 539]

Corollary 2 If $\sigma^2 = 1$, then $Z_\sigma \longrightarrow \gamma_{\rho,\sigma}$ is surjective. If On the other hand $\mathcal{G}$ contains as a quotient [d1] $SL(2, \mathbb{Z}/4\mathbb{Z})$ (without $'$!), with ρ, σ as usual, then

$$\mathrm{Im}(\delta_\sigma) = \gamma''_{\rho,\sigma}.$$

We must see that σ and $\sigma^{-1} = -\sigma$ not conjugate in $SL(2, \mathbb{Z}/4\mathbb{Z})$, using that $\tau_\infty(\sigma) = \sigma^{-1}$, therefore [d2] the elements|elements of $GL(2, \mathbb{Z}/4\mathbb{Z})$ which conjugate σ to σ^{-1} are the $g = f\tau_\infty$ with[i1] $f = t\sigma + u|n$, [d3] and therefore that $\det(g) = 1$ means $\det f = -1$ i.e. $t^2 + u|n^2 = -1$, impossible.

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 540]

[p. 573]

Let us note that by (2), (4)[i1], we have

$$(35) \qquad \tau_B \overset{\text{dfn}}{=} (\tau, -1) \in B_{\rho,\sigma}$$

And obviously $\tau_B \notin L_0 = B_{\rho,\sigma} \cap \mathcal{G}$. So we have an embedding

$$(36) \qquad \begin{cases} \mathcal{G}' = \{1, \tau\}.\mathcal{G} \hookrightarrow G_{\rho,\sigma} \\ \tau \longmapsto \tau_B \\ g \longmapsto g \quad \text{if } g \in \mathcal{G} \end{cases},$$

m1206

Marginal note. m1206 N.B. $\mathcal{G}'$ is a quotient of $\mathrm{GL}(2, \mathbf{Z})^\wedge$, and τ corresponds there to the image of the element $\tau_\infty = \begin{pmatrix} -1 & 0 \\ 0 & 1 \end{pmatrix}$ of $\mathrm{GL}(2, \mathbf{Z})$.

therefore the automorphism τ of $\mathcal{G}$ will be considered as induced by d1 $\mathrm{int}(\tau_B)$, where τ_B is itself considered as an element of $G_{\rho,\sigma}$.

d2 In connection with the equality

$$\tau_B(\sigma) = \sigma^{-1} \quad (= -\sigma)$$

which shows that τ_B normalizes the subgroup L_σ i2 generated by σ i3 (isomorphic to a quotient of $\mathbf{Z}/4\mathbf{Z}$), d3 therefore i4 normalizes $Z_\sigma = \mathrm{Centr}_{G_{\rho,\sigma}}(L_\sigma)$ i5, d4 let us introduce

$$(37) \qquad N_\sigma = \underset{(1/2 \text{ direct})}{\{1, \tau_B\}.Z_\sigma},$$

and the canonical homomorphism

$$(38) \qquad \begin{cases} N_\sigma \xrightarrow{i_\sigma} G_{\rho,\sigma} \\ \tau_B \longmapsto \tau_B, \qquad x \longmapsto x \quad \text{if } x \in Z_\sigma \end{cases}.$$

d5 The image of this homomorphism is none other than the normalizer of σ in $G_{\rho,\sigma}$, for a d6 $g \in G_{\rho,\sigma}$ which normalizes L_σ must transform σ into a generator of L_σ, i.e. into σ or σ^{-1}, in the first case we will have $g \in Z_\sigma$, in the second $g(\sigma) = \tau_B(\sigma)$ i.e. $\tau_B^{-1} g \in Z_\sigma$ i.e. $g \in \tau_B Z_\sigma$. The homomorphism (38) is injective 539

[scan 541]

d1 iff $\tau_B \notin Z_\sigma$ i.e. $\sigma \neq \sigma^{-1}$ i.e. $\sigma^2 \neq 1$ i.e. "-1" $\neq 1$.

While we are at it, let us take advantage of the formula

$$\tau_B(\rho) = \sigma(\rho^{-1})$$

to introduce

$$(39) \qquad \tau' \underset{=}{=} \sigma^{-1}\tau \in \mathcal{G}' \subset G_{\rho,\sigma}$$

(which corresponds to the element

$$(40) \qquad \tau'_\infty = \sigma_\infty^{-1}\tau_\infty = -\sigma_\infty\tau_\infty = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \in \underbrace{\mathrm{GL}(2,\mathbf{Z})}_{\| \; \mathcal{T}_{1,1}}\Big),$$

d2 we will therefore have

$$(40) \qquad \tau'^2 = 1, \qquad \tau'(\rho) = \rho^{-1}.$$

d3 d4

Thus τ' normalizes the subgroup L_ρ (isomorphic to a quotient of $\mathbf{Z}/6\mathbf{Z}$) generated by ρ, therefore it normalizes the centralizer Z_ρ [i3] of L_ρ, and we can construct [i2] [m1208]

Marginal note. [m1208] N.B. We have at the same time $\tau'(\sigma) = \sigma^{-1}$, therefore we can consider τ' as an element of N_σ, and [d5] we have $N_\sigma = \{1, \tau'\}.Z_\sigma$ (which is 1/2 direct)

$$N_\rho \overset{\text{dfn}}{=} \underset{\text{(semidirect)}}{\{1, \tau'\}.Z_\rho} \tag{41}$$

and [d6] [d7] canonical homomorphism

$$\begin{cases} N_\rho \xrightarrow{\ i_\rho\ } G_{\rho,\sigma} \\ \tau' \longmapsto \tau', \qquad\qquad x \longmapsto x \quad \text{for } x \in Z_\rho \end{cases} . \tag{42}$$

The image of this homomorphism is the normalizer of L_ρ in $G_{\rho,\sigma}$ — we see this as a moment ago for i_σ, noting that [d8] ρ, ρ^{-1} are the only [i4] generators of L_ρ. The homomorphism i_ρ is injective iff $\tau' \notin Z_\rho$ i.e. [d9] $\rho \neq \rho^{-1}$ i.e. $\rho^2 \neq 1$ i.e. $\rho \neq -1$ ([d10] N.B. $\rho = -1$ [i5] [d11] [d12] [d13] that ρ commutes with σ, and that $\mathcal{G}$ is a quotient of $\mathbf{Z}/12\mathbf{Z}$, with ρ corresponding to 2 and σ to 3, but here $2\rho = 0$ therefore $\mathcal{G}$ is a quotient of $\mathbf{Z}/4\mathbf{Z}$ with ρ corresponding to 2, σ to $3 = -1$ ...[i6]).

[m1209]

Marginal note. [m1209]

$$\begin{cases} N_\rho \xrightarrow{\ \delta_\rho = \delta_G \circ i_\rho\ } \gamma_{\rho,\sigma} \\ N_\sigma \xrightarrow{\ \delta_\sigma = \delta_G \circ i_\sigma\ } \gamma_{\rho,\sigma} \\ \qquad \text{epimorphisms} \end{cases} \tag{43}$$

[m1210]

Marginal note. [m1210] "We have done what was needed" to have epimorphisms φ.

[scan 544]

[p. 575] d1 $\mathfrak{g}_{\rho,\sigma}(u,\mu)|g^{(u,\mu)}_{\rho,\sigma}$ $=$i1

$$(53)\qquad \left\{ \left(\overbrace{ua_0^{-1}}^{\alpha}, \overbrace{u\tau'^{\nu_2}b_0^{-1}}^{\beta|b}, \mu \right) \,\middle|\, a_0 \in Z_\rho,\ b_0 \in Z_\sigma,\ \nu_2 = \nu_2(\mu) \right\}$$

$$(= (ua_0^{-1}, ub^{-1}, \mu)\} \quad \text{where} \quad b = b_0\tau'^{\nu_2}$$

i2 which we also write

$$(54)\qquad \mathfrak{g}_{\rho,\sigma}(u,\mu)|g^{(u,\mu)}_{\rho,\sigma} = \left\{ \left(\underbrace{ua_0^{-1}}_{\alpha}, \underbrace{u\,i_\sigma(b)}_{\beta}, \mu \right) \,\middle|\, a_0 \in Z_\rho,\quad \underset{\text{(cf. (37)(38))}}{b \in N_\sigma}\ ,\ \boxed{\varepsilon_\sigma(b) = \varepsilon_2(\mu)} \right\}$$

where $\varepsilon_\sigma : N_\sigma \longrightarrow \{\pm 1\}$ is defined in (37) as the canonical homomorphism fitting into the exact sequence

$$(55)$$

$$1 \longrightarrow Z_\sigma \longrightarrow N_\sigma \xrightarrow{\varepsilon_\sigma} \underbrace{\{\pm 1\}}_{\simeq\{1,\tau'\}} \longrightarrow 1.$$

If we look for the set of elements of $S\mathfrak{g}|g^{\text{eff}}_{\rho,\sigma}$ over (ζ,η,μ), we must in addition impose the conditions

$$(56)\qquad ua_0^{-1}\tau'^{\nu_3(\mu)} \in \mathcal{G},\quad u\,i_\sigma(b) \in \mathcal{G}$$

i.e.

$$\delta_G(ua_0^{-1}\tau'^{\nu_3}) = 1,\quad \delta_G(u\,i_\sigma(b)) = 1$$

that is, again

$$(57)\qquad \delta_G(u) = \underbrace{\delta_\sigma(b)}_{\text{cf. (43)}} = \underbrace{\delta_\rho}_{\text{cf. (43)}}\ (\tau'^{\nu_3}.a_0).$$

Let us therefore set

$$a = \tau'^{\nu_3}.a_0 \quad \text{in|in } N_\rho$$

(thus $a_0 = \tau'^{\nu_3}a$)i4 we see that

$$(54)\qquad \mathfrak{g}_{\rho,\sigma}(u,\mu)|g^{(u,\mu)}_{\rho,\sigma} = \left\{ (ua^{-1}\tau'^{\nu_3}, ub^{-1}, \mu) \,\middle|\, \begin{array}{l} a \in N_\rho,\ b \in N_\sigma \text{ such that} \\ \varepsilon_\rho(a) = \varepsilon_3(\mu),\ \varepsilon_\sigma(b) = \varepsilon_2(\mu) \\ \delta_\rho(a) = \delta_\sigma(b) = \delta_G(u) \end{array} \right\}$$

Let us therefore introduce the group

$$(55)\qquad \mathcal{M}|M_{\rho,\sigma}[0] = B_{\rho,\sigma} \times_{\gamma_{\rho,\sigma}} N_\rho \times_{\gamma_{\rho,\sigma}} N_\sigma.$$

and the composite homomorphisms

(56)

$$\begin{cases} \mathcal{M}|M_{\rho,\sigma}[0] \longrightarrow N_\rho \overset{\varepsilon_\rho}{\longleftrightarrow|\longrightarrow} \{\pm 1\} \\ \mathcal{M}|M_{\rho,\sigma}[0] \longrightarrow N_\sigma \xrightarrow{\varepsilon_\sigma} \{\pm 1\} \end{cases}$$

(again denoted $\varepsilon_\rho, \varepsilon_\sigma$ by abuse of notation) 543

[scan 545]

and

(57)

$$M_{\rho,\sigma}[0] \xrightarrow{\delta_{SM}} \gamma_{\rho,\sigma} \xrightarrow{\chi_\gamma} \widehat{\mathbb{Z}}^*$$

i.e. χ_{SM}, (or simply|simply χ)

consider
(58)

$$M_{\rho,\sigma}[0] \xrightarrow{\varepsilon_{\rho,\sigma}=(\varepsilon_\sigma,\varepsilon_\rho)} \{\pm 1\}\times\{\pm 1\}$$

and
(59)

$$M_{\rho,\sigma}[0] \xrightarrow{\varepsilon_{2,3}:x\longmapsto(\varepsilon_2(\chi(x)),\varepsilon_3(\chi(x)))} \{\pm 1\}\times\{\pm 1\}$$

and consider the subgroup of coincidences of the two preceding homomorphisms

$$(60)\quad M^{\mathrm{eff}}_{\rho,\sigma}[0] \overset{\mathrm{dfn}}{=} \{x\in S_0\{M_{\rho,\sigma}\} \mid \varepsilon_{\rho,\sigma}(x)=\varepsilon_{2,3}(x)\}$$
$$= \left\{ \begin{pmatrix} u & , & a & , & b \\ \cup & & \cup & & \cup \\ B_{\rho,\sigma} & & N_\rho & & Z_\sigma \end{pmatrix} \;\middle|\; \begin{array}{c} \delta_B(u)=\delta_\rho(a)=\delta_\sigma(b) \quad \text{i.e. } \Delta\in\gamma_{\rho,\sigma} \\ \varepsilon_\rho(a)=\varepsilon_3(\chi_\gamma(\Delta)), \quad \varepsilon_\sigma(b)=\varepsilon_2(\chi_\gamma(\Delta)) \end{array} \right.$$

We have a natural map
(61)

$$M^{\mathrm{eff}}_{\rho,\sigma}[0] \longrightarrow \mathcal{G}'\times\mathcal{G}\times\widehat{\mathbb{Z}}^*$$

$$(u,a,b) \longmapsto (\alpha,\beta,\mu)$$

$$\alpha = ua^{-1}\tau'^{\nu_\rho(a)}$$
, with $$\beta = ub^{-1}$$
$$\mu=\chi_B(u)=\chi_\rho(a)=\chi_\sigma(b)$$

m1217

Marginal note. m1217 N.B. we have identified $a\in N_\rho$, $b\in N_\sigma$ with their images $i_\rho(a)$, $i_\sigma(b)$ in $G_{\rho,\sigma}$.

m1218

Marginal note. m1218 N.B. We have set d6 $\nu_\rho(a)\in\mathbb{Z}/2$ such that $(-1)^{\nu_\rho(a)}=\varepsilon_\rho(a)$

and we have done what was needed for it to be injective and have as image $S\mathfrak{g}|g^{\mathrm{eff}}_{\rho,\sigma}$, hence induce a bijection
(62)

$$M^{\mathrm{eff}}_{\rho,\sigma}[0] \xrightarrow{\sim} S\mathfrak{g}|g^{\mathrm{eff}}_{\rho,\sigma}.$$

Remark. In fact the formulas for[i2] (61) define even a map
(62)

$$M_{\rho,\sigma}[0] \longrightarrow \mathcal{G}' \times \mathcal{G} \times \widehat{\mathbb{Z}}^*$$

and for a $(u, a, b) \in M_{\rho,\sigma}[0]$, its image (α, β, μ) is related to $u \in B_{\rho,\sigma}$ by the formulas 544

[scan 546]

[p. 576]

$$(63) \qquad \begin{cases} u(\rho) = \mathrm{int}(\alpha)(\rho) & (\mathcal{G}\text{–conjugate to } \rho^{\varepsilon'},\ \text{where } \varepsilon' = \varepsilon_\rho(a)) \\ u(\sigma) = \varepsilon\,\mathrm{int}(\beta)(\sigma) & (\mathcal{G}\text{-conjugate to } \sigma^{\varepsilon},\ \text{where } \varepsilon = \varepsilon_\sigma(b)) \end{cases}$$

(but without necessarily having $\varepsilon' = \varepsilon_3(\mu)$, $\varepsilon = \varepsilon_2(\mu)$).

This suggests a definition of a group a little bigger than $B_{\rho,\sigma}$, in which $B_{\rho,\sigma}$ will be included[i2] as a normal|$\lhd$ subgroup of index|of index $1, 2$ or 4 — and which will have the advantage, in the "good cases", of being the group of adelic points of a suitable group scheme over $\mathbb{Z}$.

On the other hand, to [d2] eliminate the sign ε in (63), (which is present even if $(u,a,b) \in M_{\rho,\sigma}[0]^{\mathrm{eff}}$), I feel like replacing β by [d3]

$$(64) \quad \beta' = \tau'^{\nu}\beta \qquad (\text{where } \nu \in \mathbb{Z}/2\mathbb{Z} \text{ related by } (-1)^{\nu} = \varepsilon)$$

So that we will have

$$(65) \quad u(\sigma) = \mathrm{int}(\beta')(\sigma) \quad \text{i.e.} \quad [u,\sigma] = \beta'\sigma(\beta')^{-1}.$$

This is related to the convention that a|which a $u \in \Gamma^{\sim}_{\mathbb{Q}}$, which we were specifying by the pair $(\alpha,\beta) \in \widehat{\Pi}'_{0,3} \times \widehat{\Pi}_{0,3}$, will henceforth be specified by the pair $(\alpha,\beta') \in \widehat{\Pi}_{0,3} \times \widehat{\Pi}'_{0,3}$, with

$$(66) \quad \chi(\alpha) = \varepsilon_3(\mu), \quad \chi(\beta') = \varepsilon_2(\mu) \qquad (\text{where } \mu = \chi(u) \text{ is the multiplier})$$

which [d5] for the operation of u on [d6]

$$\mathcal{G}^{+\wedge}_{0,3} = \mathrm{SL}(2,\mathbb{Z})^{\wedge\textcircled{1}} = \mathrm{SL}(2,\mathbb{Z})^{\wedge}/\pm 1$$

does not in fact change the particular formulas:

$$(67) \quad \begin{cases} u(\rho) = \mathrm{int}(\alpha).\rho, \quad u(\sigma) = \mathrm{int}(\beta)\sigma \quad (= \mathrm{int}(\beta').\sigma) \\ \alpha\rho(\alpha)^{-1} = \beta\sigma(\beta)^{-1}\ell_1^{\nu} \quad (= \beta'\sigma(\beta')^{-1}\ell_1^{\nu}) \end{cases} \qquad \nu = \frac{\mu-1}{2}$$

[scan 547]

but for the operation in [d1]
$\mathcal{T}^{+\wedge}_{1,1} \simeq \mathrm{SL}(2,\mathbb{Z})^\wedge$ itself gives simpler formulas, namely, instead of

$$(68)\quad \begin{cases} u(\rho) = \mathrm{int}(\alpha)\rho \qquad u(\sigma) = \varepsilon.\,\mathrm{int}(\beta)\sigma \\ \alpha\rho(\alpha)^{-1} = \varepsilon\beta\sigma(\beta)^{-1}\ell_1^\nu \end{cases},$$

the nicer formulas

$$(69)\quad \begin{cases} u(\rho) = \mathrm{int}(\alpha)\rho, \qquad u(\sigma) = \mathrm{int}(\beta')(\sigma) \\ \alpha\rho(\alpha)^{-1} = \beta'\sigma(\beta')^{-1}\ell_1^\nu \end{cases},$$

where the sign $\varepsilon = \varepsilon_2(\mu)$ has disappeared. It appears in the formulas

$$(70)\quad \chi(\alpha) = \varepsilon_3(\mu), \quad \chi(\beta') = \varepsilon_2(\mu).$$

It seems to me I have enough to be able to take up again "freehand" the preceding constructions and complete them with more adequate notations.

The group $\mathcal{G}'$ quotient of $\mathcal{T}^\wedge_{1,1} \simeq \mathrm{GL}(2,\mathbb{Z})^{\wedge\mathrm{i1}}$ is moreover taking on increasing importance in our calculations, it is the one that deserves [d2] the simple notation $\mathcal{G}$, the closed subgroup generated by ρ, σ becoming $\mathcal{G}^+$ — it corresponds to $\mathcal{T}^{+\wedge}_{1,1} \simeq \mathrm{SL}(2,\widehat{\mathbb{Z}}|\mathbb{Z})^\wedge$.

We will simply assume that $\tau \notin \mathcal{G}^+$ (τ being the image of τ_∞), or what amounts to the same, that

$$(71)\quad \tau' \notin \mathcal{G}^+$$

[scan 548]

[p. 577]

It is ultimately this element, which normalizes both L_ρ and L_σ [d1] via the remarkable formulas

$$(*)\quad \tau'(\rho) = \rho^{-1}, \qquad \tau'(\sigma) = \sigma^{-1}$$

that takes precedence over τ, which satisfies

$$(**)\quad \tau(\varepsilon_0) = \varepsilon_0^{-1}, \qquad \tau(\varepsilon_1) = \varepsilon_1^{-1} \quad \text{and even } \tau(\sigma) = \sigma^{-1}$$

(which is obviously very virtuous !), but whose action on ρ

$$\tau(\rho) = \sigma(\rho^{-1})$$

is less convenient.
m1222

Marginal note. m1222 Nevertheless τ' has over τ the serious disadvantage of not being an element of the group $\widehat{\Pi}'_{0,3} = \{1,\tau\}.\widehat{\Pi}_{0,3}$, where we have the rigidity relation $\widehat{\Pi}'^{\sigma}_{0,3} = \widehat{\Pi}'^{\rho}_{0,3} = \{1\}$ — whereas in $\{1,\tau'\}.\widehat{\Pi}_{0,3}$, the centralizer of σ is not reduced to 1, but is equal to $\{1,\tau'\}$ Moreover, τ' has the disadvantage of not being in $\mathcal{M}^{\dagger|\prime}_{0,3}$ ...

$$\overline{\underline{\mathrm{V}}}$$

Preliminary data

1°) So let $\mathcal{G}$ be a profinite group, equipped with a surjective homomorphism

$$= \,|\, \to$$

(1)

$$\mathcal{T}^{*|+\wedge}_{1,1} \simeq \mathrm{GL}(2,\mathbb{Z})^{\wedge} \xrightarrow{\text{epimorphism}} \mathcal{G}$$

,

which we will express by giving the three topological generators $\rho, \sigma, \tau' \in \mathcal{G}$, satisfying

$$(2) \quad \rho^6 = \sigma^4 = \tau'^2 = 1, \quad \begin{matrix}\rho^3 = \sigma^2 \\ (\text{denoted } -1)\end{matrix}, \quad \tau'\rho\tau'^{-1} = \rho^{-1}, \quad \tau'\sigma\tau'^{-1} = \sigma^{-1}.$$

We denote by $\mathcal{G}^+$ the closed subgroup generated by ρ, σ, which is thus the image of

$$\mathcal{T}^{+\wedge}_{1,1} \simeq \mathrm{SL}(2,\mathbb{Z})^{\wedge},$$

547

Apparatus for this scan

140-3-s548-D001 *deletion. Manuscript:* by
Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

Scans 549–567

[scan 549]

and we assume that $\mathcal{G}^+ \neq \mathcal{G}$, hence

$$\begin{matrix}\mathcal{G} \simeq \{1,\tau'\}\,.\,\mathcal{G}^+ \\ (\tfrac{1}{2} \text{ direct})\end{matrix} \tag{3}$$

and we have a canonical exact sequence

$$1 \longrightarrow \mathcal{G}^+ \longrightarrow \mathcal{G} \xrightarrow{\varepsilon_{\mathcal{G}}} \{\pm 1\} \longrightarrow 1 \tag{4}$$

We also denote by $\nu_{\mathcal{G}}$ the composite

$$\begin{array}{ccccc} & & \overset{\nu_{\mathcal{G}}}{\frown} & & \\ \mathcal{G} & \xrightarrow{\varepsilon_{\mathcal{G}}} & \{\pm 1\} & \xleftarrow{\sim} & \mathbb{Z}/2\mathbb{Z} \\ & & (-1)^{\nu} & \longleftarrow\!\shortmid & \nu \end{array} \tag{5}$$

In general, we will denote (by abuse of language) by the same letter elements of $\mathrm{Gl}(2,\mathbb{Z})$ — such as $\varepsilon_0, \varepsilon_1, \tau = \tau_\infty, \tau' = \tau'_\infty$, $\sigma = \sigma_\infty, \rho = \rho_\infty$ etc — and their images in $\mathcal{G}$.

The groups $Z_{\rho,\sigma}$, $\gamma_{\rho,\sigma}$

2°) Let

$$Z_{\rho,\sigma} \subset \mathrm{Aut}(\mathcal{G}^+) \times \widehat{\mathbb{Z}}^* \times \{\pm 1\} \times \{\pm 1\}$$
$$\| \text{ dfn}$$
$$\left\{ (u,\mu,\varepsilon,\varepsilon') \;\middle|\; \begin{array}{l} u(\varepsilon_0) = \varepsilon_0^{\mu} \\ u(\rho) \text{ conjugate in } \mathcal{G}^+ \text{ to } \rho^{\varepsilon'} \\ u(\sigma) \text{ _____ to } \sigma^{\varepsilon} \end{array} \right\} \tag{6}$$

This is a subgroup of the product group.

Let us put

$$\begin{cases} L_\rho = \text{subgroup of } \mathcal{G} \text{ generated by } \rho \\ L_\sigma = \text{_____} \sigma \end{cases} \tag{7}$$

so that we have epimorphisms

$$\begin{cases} \mathbb{Z}/6\mathbb{Z} \xrightarrow{\text{epimorphism}} L_\rho & n \longmapsto \rho^n \\ \mathbb{Z}/4\mathbb{Z} \longrightarrow L_\sigma & n \longmapsto \sigma^n \end{cases}, \tag{8}$$

[p. 548]

`140-3-s549-D001` *deletion. Manuscript: B*

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 550]

[p. 578]

and [d1] a commutative diagram of [i1]homomorphisms

(9)

— If $\mathcal{G}$ is "big enough", we will moreover have that $\{\pm 1\} \hookrightarrow \mathcal{G}^+$ i.e. "-1" $\neq 1$ in $\mathcal{G}^+$, and even

$$L_\rho \cap L_\sigma = \{\pm 1\} .$$

The conditions (6) therefore imply that

$$\begin{cases} u(L_\rho) \ \mathcal{G}^+\text{-conjugate to } L_\rho \\ u(L_\sigma) \ \mathcal{G}^+\text{-conjugate to } L_\sigma \end{cases} \tag{10}$$

If $\mathcal{G}^+$ is "big enough" so that ρ and ρ^{-1}, σ and σ^{-1} are not conjugate in it, then an element $(u,\mu,\varepsilon,\varepsilon')$ of $Z_{\rho,\sigma}$ is known from the sole knowledge of (u,μ). If on the other hand the homomorphism

$$\begin{array}{ccc} \widehat{\mathbb{Z}} & \longrightarrow & \mathcal{G}^+ \\ n & \longmapsto & \varepsilon_0^n \end{array} \tag{11}$$

is injective, then μ is known when we know u. Thus if $\mathcal{G}^+$ is big enough to satisfy the three conditions considered (for example so that we have a "modular homomorphism"

$$\mathcal{G} \longrightarrow \mathrm{Gl}(2, \widehat{\mathbb{Z}}) \tag{12}$$

(sending ρ, σ, τ' to the elements with the same names), then an element of $Z_{\rho,\sigma}$ is known from the sole [p. 549]

[scan 551]

knowledge of $u \in \mathrm{Aut}(\mathcal{G}^+)$.

We have a homomorphism

$$\begin{aligned} L_0 &\xrightarrow{i_{L_0,Z}} Z_{\rho,\sigma} \\ \ell &\longmapsto (\mathrm{int}(\ell), 1, 1, 1) \end{aligned} \tag{13}$$

whose image is normal, the kernel is none other than $L_0 \cap \mathrm{Cent}(\mathcal{G}^+)$. Let us note that we have

$$L_0 \cap \mathrm{Cent}(\mathcal{G}^+) \subset L_0 \cap \mathrm{Cent}_{\mathcal{G}^+}(\rho) \subset L_0 \cap L_1 \tag{14}$$

for if $\ell \in L_0$ and ρ commute, i.e. if $\ell = \rho(\ell)$,[i1] since [d1] $\rho(L_0) = L_1$, we will have $\ell \in L_1$. Thus if $L_0 \cap L_1 = \{1\}$ (which is the case if (12) exists), [d2] and even if there exists only

$$\mathcal{G} \longrightarrow \mathrm{Gl}(2, \widehat{\mathbb{Z}})' \qquad \text{modular}, \tag{12'}$$

then we will have

$$L_0 \cap \mathrm{Cent}(\mathcal{G}^+) = \{1\}, \tag{15}$$

and (13) will be injective. We are going to assume this, to fix ideas.

We put

$$\gamma_{\rho,\sigma} = Z_{\rho,\sigma} / \mathrm{Im}\, L_0, \tag{16}$$

so that we will have a canonical exact sequence

$$1 \longrightarrow L_0 \xrightarrow{i_{L_0,Z}} Z_{\rho,\sigma} \xrightarrow{\delta_Z} \gamma_{\rho,\sigma} \longrightarrow 1 \quad . \tag{17}$$

The canonical projection homomorphisms $(u, \mu, \varepsilon, \varepsilon') \mapsto \mu$, $\varepsilon, \varepsilon'$ factor through $\gamma_{\rho,\sigma}$ and give canonical homomorphisms [p. 550]

Apparatus for this scan

140-3-s551-I001 *insertion. Manuscript:* i.e. if $\ell = \rho(\ell)$,
Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

140-3-s551-D001 *deletion. Manuscript:* $\ell = \rho(\ell)$

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 552]

[p. 579]

$$\left\{\begin{array}{l} \gamma_{\rho,\sigma} \xrightarrow{\chi_\gamma} \widehat{\mathbb{Z}}^* \\ \gamma_{\rho,\sigma} \xrightarrow{\varepsilon_\gamma} \{\pm 1\} \\ \gamma_{\rho,\sigma} \xrightarrow{\varepsilon'_\gamma} \{\pm 1\} \end{array}\right. \quad \text{i.e.} \quad \gamma_{\rho,\sigma} \xrightarrow{(\chi_\gamma,\varepsilon_\gamma,\varepsilon'_\gamma)} \widehat{\mathbb{Z}}^* \times \{\pm 1\} \times \{\pm 1\} \tag{18}$$

the composites of these with $Z_{\rho,\sigma} \to \gamma_{\rho,\sigma}$ are denoted

$$\chi_Z = \chi_\gamma \circ \delta_Z, \quad \varepsilon_Z = \varepsilon_\gamma \circ \delta_Z, \quad \varepsilon'_Z = \varepsilon'_\gamma \circ \delta_Z, \tag{19}$$

so that

$$\chi_Z(u,\mu,\varepsilon,\varepsilon') = \mu, \quad \varepsilon_Z(u,\mu,\varepsilon,\varepsilon') = \varepsilon, \quad \varepsilon'_Z(u,\mu,\varepsilon,\varepsilon') = \varepsilon' \tag{20}$$

We would feel like denoting by $\gamma^{0|\circ}_{\rho,\sigma}$ the kernel of $(\varepsilon_\gamma, \varepsilon'_\gamma)$, by $\gamma^{+}_{\rho,\sigma}$ that of χ_γ, by $\gamma^{0|\circ+}_{\rho,\sigma}$ their intersection, and introducing under the notations $Z^{0|\circ}_{\rho,\sigma}$, $Z^{+}_{\rho,\sigma}$, $Z^{0|\circ+}_{\rho,\sigma}$ their inverse images in $Z_{\rho,\sigma}$, i.e. the kernels resp.[t]|resp. of $(\varepsilon_Z, \varepsilon'_Z)$, of χ_Z and of $(\chi_Z, \varepsilon_Z, \varepsilon'_Z)$.

The groups $S_0G_{\rho,\sigma}$, $G_{\rho,\sigma}$

3°) [d1] We have a tautological homomorphism[i1]

$$\begin{array}{ccc} Z_{\rho,\sigma} & \longrightarrow & \mathrm{Aut}(\mathcal{G}^+) \\ (u,\mu,\varepsilon,\varepsilon') & \longmapsto & u \end{array}, \tag{21}$$

thus $Z_{\rho,\sigma}$ acts|operates on $\mathcal{G}^+$, and we can therefore consider the $\frac{1}{2}$ direct product

$$S_0G_{\rho,\sigma} = Z_{\rho,\sigma} \,.\, \mathcal{G}^+ \ . \quad (\tfrac{1}{2}\text{-direct}) \tag{22}$$

[p. 551]

Apparatus for this scan

140-3-s552-D001 *deletion. Manuscript:* The group $Z_{\rho,\sigma}$ operates,
Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

140-3-s552-I001 *insertion. Manuscript:* We have a tautological homomorphism
Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

[scan 553]

We have a homomorphism

$$\begin{aligned} L_0 &\xrightarrow{i_{L_0,SG}} S_0 G_{\rho,\sigma} = Z_{\rho,\sigma} \,.\, \mathcal{G}^+ \\ \ell &\longmapsto i_{L_0,Z}(\ell) \,.\, \ell^{-1} \end{aligned} \tag{23}$$

whose image is again normal, [d1] We[i1] [d2] put[i2]

$$G_{\rho,\sigma} = \underbrace{S_0 G_{\rho,\sigma}}_{Z_{\rho,\sigma}.\mathcal{G}^+} / \operatorname{Im} L_0 \ , \tag{24}$$

so that we will have an exact sequence

$$1 \longrightarrow L_0 \xrightarrow{i_{L_0,SG}} S_0 G_{\rho,\sigma} \longrightarrow G_{\rho,\sigma} \longrightarrow 1 \quad , \tag{25}$$

and a diagram commutative[i3] of homomorphisms

$$\begin{array}{ccccc} & & Z_{\rho,\sigma} & & \\ & \overset{i_{L_0,Z}}{\nearrow} & & \overset{i_Z}{\searrow} & \\ L_0 & & & & G_{\rho,\sigma} \\ & \underset{i_{L_0,\mathcal{G}}}{\searrow} & & \underset{i_{\mathcal{G}^+}}{\nearrow} & \\ & & \mathcal{G}^+ & & \end{array} \tag{26}$$

(a priori $\operatorname{Ker}(\mathcal{G}^+ \to G_{\rho,\sigma}) \simeq \operatorname{Ker}(L_0 \to Z_{\rho,\sigma}) \simeq L_0 \cap \operatorname{Cent}(\mathcal{G}^+)$, but by hypothesis (15) it is reduced to $\{1\}$), fitting into a commutative diagram of exact sequences

$$\begin{array}{ccccccccc} 1 & \longrightarrow & L_0 & \xrightarrow{i_{L_0,Z}} & Z_{\rho,\sigma} & \xrightarrow{\delta_Z} & \gamma_{\rho,\sigma} & \longrightarrow & 1 \\ & & \downarrow{\scriptstyle i_{L_0,\mathcal{G}}} & & \downarrow & & \| & & \\ 1 & \longrightarrow & \mathcal{G}^+ & \xrightarrow{i_{\mathcal{G}^+}} & G_{\rho,\sigma} & \xrightarrow{\delta_G} & \gamma_{\rho,\sigma} & \longrightarrow & 1 \end{array} \quad . \tag{27}$$

We will put

$$\chi_G = \chi_\gamma \circ \delta_G, \quad \varepsilon_G = \varepsilon_\gamma \circ \delta_G, \quad \varepsilon'_\gamma \circ \delta_G \tag{28}$$

[scan 554]

[p. 580]

hence a homomorphism

$$G_{\rho,\sigma} \xrightarrow{(\chi_G,\varepsilon_G,\varepsilon'_G)} \widehat{\mathbb{Z}}^* \times \{\pm 1\} \times \{\pm 1\} \ , \tag{29}$$

leading us to introduce $G^+_{\rho,\sigma}$, $G^0_{\rho,\sigma}$, $G^{+0}_{\rho,\sigma}$ as usual.

The injection $i_{\mathcal{G}^+} : \mathcal{G}^+ \hookrightarrow G_{\rho,\sigma}$ can be extended to an embedding [d1] (denoted $i_{\mathcal{G}}$)

$$i_{\mathcal{G}} : \mathcal{G} \hookrightarrow G_{\rho,\sigma} \ , \tag{30}$$

which I define by its value on [d2] $\tau = \sigma\tau'^{i1}$, by

$$i_{\mathcal{G}}(\tau) = i_Z(\tau_Z) \tag{31}$$

m1227

Marginal note. [m1227] If τ_γ denotes the image of $\tau = \tau_G \in G_{\rho,\sigma}$ in $\gamma_{\rho,\sigma} = G_{\rho,\sigma}/\mathcal{G}^+$, $\mathcal{G}$ is identified with the inverse image in $G_{\rho,\sigma}$ of the subgroup $\{1, \tau_\gamma\}$ of $\gamma_{\rho,\sigma}$.

$$\begin{cases} \tau_Z \in Z_{\rho,\sigma} \quad \text{defined as} \\ \tau_Z = \left(\underbrace{\text{int}(\tau)|\mathcal{G}^+}_{\in \text{Aut}(\mathcal{G}^+)}, \underset{\widehat{\mathbb{Z}}^*}{-1}, \underset{\{\pm 1\}}{-1}, \underset{\{\pm 1\}}{-1} \right). \end{cases} \tag{32}$$

From now on we identify $\mathcal{G}$ with a subgroup of $G_{\rho,\sigma}$, and we denote by the same letter elements of $\mathcal{G}$ (such as $\tau, \tau', \rho, \sigma, \varepsilon_0, \varepsilon_1$, etc) and their images in $G_{\rho,\sigma}$. [m1228]

Marginal note. [m1228] Note that $\tau'_G \notin Z_{\rho,\sigma}$ on the other hand we have [d5] $\tau_G \in Z_{\rho,\sigma}$ [d6].

We will moreover have

$$\chi_G|\mathcal{G} = \varepsilon_G|\mathcal{G} = \varepsilon'_G|\mathcal{G} = \varepsilon_{\mathcal{G}} : \begin{cases} \text{trivial on } \mathcal{G}^+ \\ -1 \text{ on } \mathcal{G}^- = \mathcal{G} \setminus \mathcal{G}^+. \end{cases} \tag{32bis}$$

m1229

Marginal note. [m1229] The groups $Z_\rho, Z_\sigma, N_\rho, N_\sigma, SN_\rho, SN_\sigma$...

4°) We [d7] note that the element τ' of [d8] $\mathcal{G} \subset G_{\rho,\sigma}$ normalizes L_ρ and L_σ, therefore also normalizes

$$\begin{cases} Z_\rho \overset{\text{dfn}}{=} \text{Cent}_{G_{\rho,\sigma}}(\rho) = \text{Cent}_{G_{\rho,\sigma}}(L_\rho), \\ Z_\sigma \overset{\text{dfn}}{=} \text{Cent}_{G_{\rho,\sigma}}(\sigma) = \text{Cent}_{G_{\rho,\sigma}}(L_\sigma) \end{cases} \tag{33}$$

thus $\{1, \tau'\}$ acts on these groups, and we can consider

$$\begin{cases} N_\rho = \{1, \tau'\} \,.\, Z_\rho, \\ N_\sigma = \{1, \tau'\} \,.\, Z_\sigma \end{cases} \qquad \text{(products } \tfrac{1}{2} \text{ direct).} \tag{34}$$

We have canonical exact sequences

$$\begin{array}{c} 1 \longrightarrow Z_\rho | L_\rho \longrightarrow N_\rho \xrightarrow{\varepsilon_\rho} \{\pm 1\} \longrightarrow 1 \\ \\ 1 \longrightarrow Z_\sigma \longrightarrow N_\sigma \xrightarrow{\varepsilon_\sigma} \{\pm 1\} \longrightarrow 1 \end{array} \quad , \tag{35}$$

and a commutative diagram of canonical homomorphisms

$$\begin{array}{ccccc} & & \mathbb{D}_\rho & \longrightarrow & N_\rho \\ \nearrow & & & & \searrow^{i_\rho} \\ \{1, \tau'\} \times \{\pm 1\} & & & & G_{\rho,\sigma} \\ \searrow & & & & \nearrow_{i_\sigma} \\ & & \mathbb{D}_\sigma & \longrightarrow & N_\sigma \end{array} \tag{36}$$

where

$$\begin{cases} \mathbb{D}_\rho \simeq \mathbb{D}_6 \subset \mathrm{Gl}(2, \mathbb{Z}) \quad \text{generated by } \rho, \tau' \\ \mathbb{D}_\sigma \simeq \mathbb{D}_4 \subset \mathrm{Gl}(2, \mathbb{Z}) \quad \text{_____} \ \sigma, \tau' \\ \{1, \tau'\} \times \{\pm 1\} = \mathbb{D}_\rho \cap \mathbb{D}_\sigma \quad \text{in } \mathrm{Gl}(2, \mathbb{Z}), \end{cases} \tag{37}$$

d2

$$\begin{cases} \mathbb{D}_\rho = \{1, \tau'\} \,.\, L_\rho & (\text{at least if } \rho \text{ of order 6 in } \mathcal{G}) \\ \mathbb{D}_\sigma = \{1, \tau'\} \,.\, L_\sigma & (\text{_____ } \sigma \text{ of order 4 } \text{_____}), \end{cases} \tag{38}$$

and the homomorphisms

$$\mathbb{D}_\rho \longrightarrow N_\rho, \qquad \mathbb{D}_\sigma \longrightarrow N_\sigma$$

are obvious. The homomorphisms i_ρ, i_σ too, of course.

Let us recall that

$$\begin{cases} i_\rho \text{ injective} \iff \tau' \notin Z_\rho \iff \rho^2 \neq 1 \iff \rho \neq -1 \\ \qquad\qquad \iff \mathcal{G}^+ \text{ is } \dagger|\text{isomorphic to a quotient of } \mathbb{Z}/4\mathbb{Z}. \\ i_\sigma \text{ injective} \iff \tau' \notin Z_\sigma \iff \sigma^2 \neq 1 \end{cases} \tag{39}$$

[scan 556]

[p. 581]

Letting $G_{\rho,\sigma}$ act on $\mathcal{G}^+$, a normal subgroup, via inner automorphisms, we see that every element of $G_{\rho,\sigma}$ transforms $L_\rho \subset \mathcal{G}^+$ into a $\mathcal{G}^+$-[i1]conjugate subgroup, thus is congruent modulo [d1] $\mathcal{G}^+$ to an element of $\mathrm{Norm}_{G|\mathcal{G}}(L_\rho) = \mathrm{Im} i_\rho(N_\rho)$, and likewise for L_σ. In other words, setting[i2]

$$N^*_\rho \overset{\text{dfn}}{=} \{x \in N_\rho \mid \varepsilon_\rho(x) = \varepsilon'_G(i_\rho(x))\}, \qquad N^*_\sigma \overset{\text{dfn}}{=} \{x \in N_\sigma \mid \varepsilon_\sigma(x) = \varepsilon_G(i_\sigma(x))\} \tag{40}$$

[i3] the composite homomorphisms

$$\begin{cases} N^*_\rho \xrightarrow{i_\rho} G_{\rho,\sigma} \xrightarrow{\delta_G} \gamma_{\rho,\sigma} \,, & \delta_\rho \overset{\text{dfn}}{=} \delta_G \circ i_\rho \\ N^*_\sigma \xrightarrow{i_\sigma} G_{\rho,\sigma} \xrightarrow{\delta_G} \gamma_{\rho,\sigma} \,, & \delta_\sigma \overset{\text{dfn}}{=} \delta_G \circ i_\sigma \end{cases} \tag{40}$$

epimorphisms. [d2] We thus have [d3i4]

m1230

Marginal note. [m1230] If $g \in G_{\rho,\sigma}$, and $\varepsilon = \varepsilon_G(g)$, $\varepsilon' = \varepsilon'_G(g)$, then

$$\mathrm{int}(g)(\rho) \underset{\mathcal{G}^+}{\sim} \rho^{\varepsilon'} = \tau^{\nu'}(\rho),$$
$$\mathrm{int}(g)(\sigma) \underset{\mathcal{G}^+}{\sim} \sigma^{\varepsilon} = \tau^{\nu}(\rho)|\tau^{\nu}(\sigma).$$

d4 (where $(-1)^{\nu} = \varepsilon$, $(-1)^{\nu'} = \varepsilon'$), thus[i5] d5 $\exists a = \tau^{\nu'}\,.\, a_0|ag \in N_\rho$ (where $a_0 = \tau^{\nu} g$) such that
a) $g \equiv a|a_0$ $(\mathcal{G}^+)$ and
b) $\varepsilon_\rho(a) = \varepsilon'|\varepsilon'_G = \varepsilon'_G(g)|\varepsilon_G(g)$ —
(and idem for N_σ…)
thus

$$\mathrm{Im}(N_\rho^{(+1)} \to \gamma_{\rho,\sigma}) \supset \gamma'_{\rho,\sigma},$$
$$\mathrm{Im}(N_\rho^{(-1)} \longrightarrow \gamma_{\rho,\sigma}) \supset \gamma_{\rho,\sigma} \setminus \gamma'_{\rho,\sigma}.$$

But this does not prove that we have commutativity! hence probably

d9 d10

d12 commutative[i6] diagram of d13 exact sequences

$$\begin{array}{ccccccccc} 1 & \longrightarrow & Z_\rho & \longrightarrow & N^*_\rho & \xrightarrow{\varepsilon_\rho} & \{\pm 1\} & \longrightarrow & 1 \\ & & \downarrow \text{epimorphism} & & \downarrow \text{epimorphism} & & \| & & \\ 1 & \longrightarrow & \gamma'_{\rho,\sigma} & \longrightarrow & \gamma_{\rho,\sigma}|Z_{\rho,\sigma} & \xrightarrow{\varepsilon'_\gamma} & \{\pm 1\} & \longrightarrow & 1 \end{array} \tag{41}$$

[scan 557]

N.B. The notations $\varepsilon_\gamma, \varepsilon'_\gamma : \gamma_{\rho,\sigma} \longrightarrow \{\pm 1\}$ can lead to confusion, the first referring|pertaining to the action of a u on L_σ (not on L_ρ). A slightly heavier notation, but not leading to confusion, would be $\varepsilon_{\gamma,\rho}, \varepsilon_{\gamma,\sigma}$ — or even just $\varepsilon_\rho, \varepsilon_\sigma$, the confusion with the homomorphisms of this name $N'_\rho|N^*_\rho \longrightarrow \{\pm 1\}$, $N_\sigma \longrightarrow \{\pm 1\}$ being harmless when $\rho^2 \neq 1, \sigma^2 \neq 1$, because of the compatibilities (41) (43).

We have thus constructed, with the aid of|of the (1) i.e. of $\mathcal{G}$ equipped with ρ, σ, τ', groups $\mathcal{G}^+$,[i1] $G_{\rho,\sigma}, \gamma_{\rho,\sigma}, Z_{\rho,\sigma}, N'_\rho, N'_\sigma$, fitting into a commutative diagram of groups

(45)

where we have set

$$\begin{cases} SZ_{\rho,\sigma} = i_{L_0,Z}(L_0) = \mathrm{Ker}(\delta_Z : Z_{\rho,\sigma} \longrightarrow \gamma_{\rho,\sigma}) \\ SN'_\rho = \mathrm{Ker}(\delta_\rho : N^*_\rho \longrightarrow \gamma_{\rho,\sigma}) = \mathrm{Cent}_{\mathcal{G}^+}(\rho) \\ SN'_\sigma = \mathrm{Ker}(\delta_\sigma : N^*_\sigma \longrightarrow \gamma_{\rho,\sigma}) = \mathrm{Cent}_{\mathcal{G}^+}(\sigma) \end{cases} \tag{46}$$

m1231

Marginal note. [m1231] N.B. We can thus also denote them by SZ_ρ, SZ_σ instead of the SN^*_ρ, SN^*_σ.

[p. 556]

[p. 582]

in such a way that we have exact sequences

$$\begin{cases} 1 \longrightarrow S\dagger N^*_\rho \longrightarrow N^*_\rho \xrightarrow{\delta_\rho} \gamma_{\rho,\sigma} \longrightarrow 1 \\ 1 \longrightarrow SN^*_\sigma \longrightarrow N^*_\sigma \xrightarrow{\delta_\sigma} \gamma_{\rho,\sigma} \longrightarrow 1 \end{cases} \tag{47}$$

m1232

Marginal note. m1232 We have

$$\begin{cases} \mathrm{Im}(SN_\rho \longrightarrow \mathcal{G}^+) = \mathrm{Norm}_{\mathcal{G}^+}(L_\rho) \\ \mathrm{Im}(SN_\sigma \longrightarrow \mathcal{G}^+) = \mathrm{Norm}_{\mathcal{G}^+}(L_\sigma) \end{cases} \tag{47bis}$$

(or again, if $\rho^2 \neq 1$ resp. $\sigma^2 \neq 1$, $N_\rho \cap \mathcal{G}$ and $N_\sigma \cap \mathcal{G}$)

mapping to the exact sequence

$$1 \longrightarrow \mathcal{G}^+ \longrightarrow G_{\rho,\sigma} \longrightarrow \gamma_{\rho,\sigma} \longrightarrow 1 \ ,$$

in a way analogous to (27). Moreover, the homomorphisms $i_\rho : N_\rho^* \longrightarrow G_{\rho,\sigma}$ and $i_\sigma : N_\sigma^* \longrightarrow G_{\rho,\sigma}$ have a marked tendency to be injective (cf. (39)), which we have marked on diagram (45) by the sign $\hookrightarrow$ (dotted inclusion sign).

We also introduce

$$\begin{cases} \chi_\rho = \chi_\gamma \circ \delta_\rho : \ \dagger N_\rho^* \longrightarrow \widehat{\mathbb{Z}}^* \\ \chi_\sigma = \chi_\gamma \circ \delta_{\dagger\sigma} : \ \dagger N_\sigma^* \longrightarrow \widehat{\mathbb{Z}}^* \end{cases} , \tag{48}$$

whose kernels (which contain $S\dagger N_\rho$ resp. SN_σ, and which we shall take care not to confuse with them) are denoted as is only right by $N_\rho^{*+}, N_\sigma^{*+}$.

N.B. We should still examine the composites

$$\begin{cases} N_\rho^* \longrightarrow \gamma_{\rho,\sigma} \xrightarrow{\varepsilon_{\gamma,\sigma}} \{\pm 1\} \\ N_\sigma^* \longrightarrow \gamma_{\rho,\sigma} \xrightarrow{\varepsilon_{\gamma,\rho}} \{\pm 1\} \end{cases} , \tag{49}$$

we shall see that in the "good cases", the restrictions of these homomorphisms to Z_ρ, Z_σ respectively are epimorphisms. [p. 557]

We also have

$$S_0\mathcal{M}_{\rho,\sigma} \simeq \mathcal{M}_{\rho,\sigma} \underset{\gamma_{\rho,\sigma}}{\times} Z_{\rho,\sigma} \tag{57}$$

$$S_0\Gamma_{\rho,\sigma} \simeq \Gamma_{\rho,\sigma} \underset{\gamma_{\rho,\sigma}}{\times} Z_{\rho,\sigma} \tag{58}$$

i.e. the extensions $S_0\mathcal{M}_{\rho,\sigma}, S_0\Gamma_{\rho,\sigma}$ of $\mathcal{M}_{\rho,\sigma}, \Gamma_{\rho,\sigma}$ by L_0 are deduced from the extension $Z_{\rho,\sigma}$ of $\gamma_{\rho,\sigma}$ by L_0 by inverse image under $\mathcal{M}_{\rho,\sigma} \to \gamma_{\rho,\sigma}, \Gamma_{\rho,\sigma} \to \gamma_{\rho,\sigma}$ — and we also have [d1]

$$S_0\mathcal{M}_{\rho,\sigma} \simeq \mathcal{M}_{\rho,\sigma} \underset{\Gamma_{\rho,\sigma}}{\times} S_0\Gamma_{\rho,\sigma} \tag{59}$$

i.e. the extension $S_0\mathcal{M}_{\rho,\sigma}$ of $\mathcal{M}_{\rho,\sigma}$ by L_0 is deduced from the extension $S_0\Gamma_{\rho,\sigma}$ of $\Gamma_{\rho,\sigma}$ by L_0, by inverse image under $\mathcal{M}_{\rho,\sigma} \to \Gamma_{\rho,\sigma}$.

We introduce an element[i1]

$$, \qquad \tau'_{\mathcal{M}} \in \mathcal{M}_{\rho,\sigma} \qquad \tau'_{\mathcal{M}} = (\overset{a}{\|}\tau'_\rho, \overset{b}{\|}\tau'_\sigma, \overset{u}{\|}\tau'_G) \tag{60}$$

[d8] where $, \tau'_\rho, \tau'_\sigma, \tau'_G$ are the[i6] "avatars" of τ', taken resp. in $N^*_\rho, N^*_\sigma, G_{\rho,\sigma}$. These do indeed all have the same image in $G_{\rho,\sigma}$ and a fortiori in $\gamma_{\rho,\sigma}$, hence define an element of $\mathcal{M}_{\rho,\sigma}$, whose operation on $\mathcal{G}^+$ is that of τ. Whence an embedding

$$(61) \qquad \mathcal{G} \xhookrightarrow{i_{\mathcal{G},\mathcal{M}}} \mathcal{M}_{\rho,\sigma} \qquad : \text{identity on } \mathcal{G}^+ \qquad \tau'_{\mathcal{G}} \longmapsto \tau'_{\mathcal{M}}.$$

[Diagram continued on the landscape page; 140-3-561-D1]

(62)

$\|$

$\{1, \tau'\} \,.\, \mathcal{G}^+$

We have summarized [d3]some of the[i1] relations between the groups introduced so far in the commutative diagram (62), which I comment on briefly.

a) All the arrows are either injections ($\hookrightarrow$) or surjections ($\longrightarrow$), with the exception perhaps[i2] of the three arrows issuing from $\gamma_{\rho,\sigma}$.

b) The ten squares (six faces of a cube, and [d4]three|the[i3] squares marked $\mathrm{I}, \mathrm{II}, \mathrm{III}^{+|'}, \mathrm{IV}, \mathrm{V}$) are cartesian.

c) The five[i4] arrows marked pr are projections, canonical from product groups onto partial products. The arrow marked inj

$$\mathcal{G}^+ \longrightarrow SN_\rho^* \times SN_\sigma^* \times \mathcal{G}^+$$

is the canonical injection.

d) In order not to destroy the commutativity of the diagram, we have omitted to show in it the arrows (of inclusion, in particular)[i5]

$$Z_{\rho,\sigma} \longrightarrow G_{\rho,\sigma}, \qquad N_\rho^* \longrightarrow G_{\rho,\sigma}, \qquad N_\sigma^* \longrightarrow G_{\rho,\sigma}$$

which appeared in (45).

`140-3-561-D1` *Layout placement.* Diagram exceeds the portrait measure after local spacing repair; a landscape page preserves the diagram at 10pt with a marked reference at its original position. The region label II is lowered by 3pt inside the same triangular region; both right-hand epsilon labels are placed at position 0.75 and the

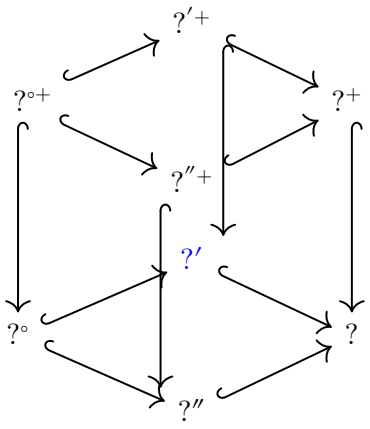
uncertain projection label at position 0.25 along their own arrows to clear crossing verticals. Matrix dimensions, routes and endpoints remain unchanged.

[scan 562]

e) In order not to overload the diagram, I have not introduced in the diagram notations for certain useful composite arrows, such as

$$(63)\qquad \begin{cases} \delta_{\Gamma} : \Gamma_{\rho,\sigma} \longrightarrow \gamma_{\rho,\sigma}, \\ \delta_{S_0\Gamma} : S_0\Gamma_{\rho,\sigma} \longrightarrow \gamma_{\rho,\sigma} \\ \delta_{\mathcal{M}} : \mathcal{M}_{\rho,\sigma} \longrightarrow \gamma_{\rho,\sigma} \\ \delta_{S_0\mathcal{M}} : S_0\mathcal{M}_{\rho,\sigma} \longrightarrow \gamma_{\rho,\sigma} \end{cases}$$

and

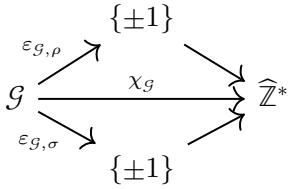


$$(64)\qquad \begin{cases} \chi_{\Gamma} = \chi_{\gamma} \circ \delta_{\Gamma} : \Gamma_{\rho,\sigma} \longrightarrow \widehat{\mathbb{Z}}^* \\ \chi_{S_0\Gamma} = \chi_{\gamma} \circ \delta_{S_0\Gamma} : S_0\Gamma_{\rho,\sigma} \longrightarrow \widehat{\mathbb{Z}}^* \\ \chi_{\mathcal{M}} = \chi_{\gamma} \circ \delta_{\mathcal{M}} : \mathcal{M}_{\rho,\sigma} \longrightarrow \widehat{\mathbb{Z}}^* \\ \chi_{S_0\mathcal{M}} = \chi_{\gamma} \circ \delta_{S_0\mathcal{M}} : S_0\mathcal{M}_{\rho,\sigma} \longrightarrow \widehat{\mathbb{Z}}^* \end{cases}$$

and the composites $\varepsilon_{?,\rho}, \varepsilon_{?,\sigma} : ? \longrightarrow \{\pm 1\}$, where ? can take [d2] value Z, G (already introduced) N_ρ^*, N_σ^* (we will have $\varepsilon_{N_\rho,\rho} = \varepsilon_\rho, \quad \varepsilon_{N_\sigma,\sigma} = \varepsilon_\sigma$), $\Gamma, S_0\Gamma, \mathcal{M}, S_0\mathcal{M}$. The kernel of $\chi_?$ is denoted $?^+$, that of $\varepsilon_{?,\rho}$ is denoted $?'$, that of $\varepsilon_{?,\sigma}$ is denoted $?''$, we write

$$?^\circ \doteq ?' \cap ?'', \qquad ?^{+\prime} = ?^+ \cap ?', \quad ?^{+\prime\prime} = ?^+ \cap ?'',$$
$$?^{+,\circ} = ?^+ \cap ?^\circ, \quad S? = \operatorname{Ker} \delta_?,$$

[d5] hence



(65)

"cartesian" cube.

f) Let us also recall that we have commutativity in

(66)

, i.e. $\varepsilon_{\mathcal{G}} : \mathcal{G} \longrightarrow \{\pm 1\}$,

[scan 563]

[p. 585]

The kernel of $\varepsilon_{\mathcal{G}}$ is none other than $\mathcal{G}^+$. In its capacity as a subgroup of $\mathcal{M}_{\rho,\sigma}$ (resp. of $G_{\rho,\sigma}$) $\mathcal{G}$ is identified with the inverse image in this group of the subgroup $\{1, \tau'_\Gamma\}$ of $\Gamma_{\rho,\sigma}$ (resp. of the subgroup[i1] $\{1, \tau'_\gamma\}$ of $\gamma_{\rho,\sigma}$), where $\tau'_\Gamma, \tau'_\gamma$ denote the images of $\tau' \in \mathcal{G}$ in $\Gamma_{\rho,\sigma}$ and $\gamma_{\rho,\sigma}$ respectively.

g) The diagram (62) has as its main part

(67)

all the groups marked on this last[i2] diagram, except for $\widehat{\mathbb{Z}}^*, \{\pm 1\}, \{\pm 1\}$ (put in brackets [ ]) map to $\gamma_{\rho,\sigma}$, which is the terminal term of this diagram, linking 9 groups (not counting $\mathcal{G}$ inserted [d3] as [d4]outside[i3] [d5]of two[i4] dotted arrows) including $\gamma_{\rho,\sigma}$, obtained from four of them

$Z_{\rho,\sigma}, N^*_\rho, N^*_\sigma, G_{\rho,\sigma}$ (which map to $\gamma_{\rho,\sigma}$ by epimorphisms) by taking fiber products over $\gamma_{\rho,\sigma}$ of certain of them — [d6] the initial term being $S_0\mathcal{M}_{\rho,\sigma}$, which is the fiber product of the four preceding factors. Taking the kernels of the homomorphisms from these [d7] nine groups to $\gamma_{\rho,\sigma}$, we find a diagram of the same combinatorial type, linking

[p. 586]

6°) The set $\Sigma_{\rho,\sigma}, S\mathcal{G}|g_{\rho,\sigma}$.

We put

$$\Sigma_{\rho,\sigma} \subset \mathcal{G}^+ \times \mathcal{G}^+ \times \widehat{\mathbb{Z}}^* \times \{\pm 1\} \times \{\pm 1\}$$

$$\| \tag{68}$$

$$\left\{ (\xi, \eta, \mu, \varepsilon', \varepsilon) \;\middle|\; \begin{array}{l} \xi\rho \ \mathcal{G}^+\text{-conjugate to } \rho^{\varepsilon'} \\ \eta\sigma \ \mathcal{G}^+\text{-conjugate to } \sigma^{\varepsilon} \\ \xi = \eta \underbrace{\varepsilon_1^{\mu-1}}_{\rho_1^{\nu} \text{ where } \nu = \frac{\mu-1}{2}} \end{array} \right\}$$

N.B. If ρ not conjugate to ρ^{-1} in $\mathcal{G}^+$, ε' known when we know ξ, η — likewise if σ not conjugate to σ^{-1} (hence $\sigma^2 \neq 1$), ε' is determined by ξ, η. If this homomorphism $\widehat{\mathbb{Z}} \longrightarrow L_0$ $(n \longmapsto \varepsilon_0^n)$ is injective, then μ is determined by ξ, η, and the relation $\xi = \eta\varepsilon_1^{\mu-1}$ can also be written (without bringing in μ)

$$\eta^{-1}\xi \in L_1. \tag{69}$$

Let on the other hand

$$S\mathcal{G}_{\rho,\sigma} \subset \mathcal{G} \times \mathcal{G} \times \widehat{\mathbb{Z}}^*$$

$$\| \tag{70}$$

$$\left\{ (\alpha, \beta, \mu) \;\middle|\; \underbrace{[\alpha, \rho]}_{\xi} = [\beta, \sigma]\varepsilon_1^{\mu-1} \right\}$$

We have a map

$$(71)\qquad \begin{cases} S\mathcal{G}_{\rho,\sigma} \longrightarrow \Sigma_{\rho,\sigma} \\ (\alpha,\beta,\mu) \longmapsto (\xi,\eta,\mu,\varepsilon',\varepsilon) \end{cases} \quad \text{with} \quad \begin{cases} \xi = [\alpha,\rho] \\ \eta = [\beta,\sigma] \\ \mu \text{ the same} \\ \varepsilon' = \varepsilon_{\mathcal{G}}(\alpha) \\ \varepsilon = \varepsilon_{\mathcal{G}}(\beta) \end{cases}$$

m1236

Marginal note. m1236 N.B. $\xi = \alpha\rho(\alpha)^{-1} \in \mathcal{G}^+$, since we have $\varepsilon_{\mathcal{G}}(\xi) = \dot{\alpha}|\bar{\alpha}\rho(\dot{\alpha}|\bar{\alpha}) = 1$ since ρ operates trivially on $\mathcal{G}/\mathcal{G}^+ \simeq \{\pm 1\}$, for the same reason $\eta = \beta\sigma(\beta)^{-1} \in \mathcal{G}^+$.

which is obviously[i2] surjective.

We define on the other hand

[p. 564]

Apparatus for this scan

[scan 566]

$$(72)\qquad \begin{array}{c} \Sigma^{\text{eff}}_{\rho,\sigma} \subset \Sigma_{\rho,\sigma} \\ \Big\| \\ \Big\{ (\xi,\eta,\mu,\varepsilon',\varepsilon) \in \Sigma_{\rho,\sigma} \;\Big|\; \begin{array}{l} \exists u \in \mathrm{Aut}(\mathcal{G}^+) \text{ with} \\ u(\rho) = \xi\rho, \quad u(\sigma) = \eta\sigma \end{array} \Big\} \end{array}$$

(this u will then be unique, and conversely, knowledge of u determines ξ,η.[i1]) There is a 1-1 correspondence between the elements of $\Sigma^{\text{eff}}_{\rho,\sigma}$, and the systems $(u,\mu,\varepsilon',\varepsilon) \in \mathrm{Aut}(\mathcal{G}^+) \times \widehat{\mathbb{Z}}^* \times \{\pm 1\} \times \{\pm 1\}$, such that we have [d1] i.e. $[u,\rho] = \xi$, $[u,\sigma] = \eta$

$$\begin{cases} u(\rho) \text{ is} \\ u(\sigma) \\ u(\varepsilon_0) = \varepsilon_0^{\mu} \end{cases} \quad \begin{array}{l} \mathcal{G}^+\text{-conjugate to} \quad \rho^{\varepsilon'} \\ \hline \qquad\qquad\qquad\quad \sigma^{\varepsilon} \\ (\text{which expresses } \xi = \eta\rho_1^{\nu}) \end{array}$$

— now this set is none other than the subgroup $Z_{\rho,\sigma}|\mathbb{Z}_{\rho,\sigma}$ of $\mathrm{Aut}(\mathcal{G}^+) \times \widehat{\mathbb{Z}}^* \times \{\pm 1\} \times \{\pm 1\}$. (cf. (6) page 577')[i2]

We thus find a bijection

$$(73)\qquad \begin{array}{ccc} Z_{\rho,\sigma} & \xrightarrow{\sim} & \Sigma^{\text{eff}}_{\rho,\sigma} \\ u & \longmapsto & (\xi,\eta,\mu,\varepsilon',\varepsilon) \end{array} \qquad \begin{cases} \xi = [u,\rho] \\ \eta = [u,\sigma] \\ \mu = \chi(u) \\ \varepsilon' = \varepsilon'_Z(u) \\ \varepsilon = \varepsilon_Z(u) \end{cases} .$$

We denote by $S\mathcal{G}^{\mathrm{eff}}_{\rho,\sigma}$ the inverse image of $\Sigma^{\mathrm{eff}}_{\rho,\sigma}$ in $S\mathcal{G}_{\rho,\sigma}$ under (71), so we will have

$$S\mathcal{G}^{\mathrm{eff}}_{\rho,\sigma} \subset S\mathcal{G}_{\rho,\sigma}$$
$$\| \qquad (74)$$
$$\left\{ \{\alpha,\beta,\mu\} \in \mathcal{G}\times\mathcal{G}\times\widehat{\mathbb{Z}}^* \;\middle|\; \begin{array}{l} [\alpha,\rho] = [\beta,\sigma]\varepsilon_1^{\mu-1} \\ \exists u \in \mathrm{Aut}(\mathcal{G}^+) \text{ such that we have} \\ \left\{ \begin{array}{ll} u(\rho) = \alpha(\rho) & (= \xi\rho, \text{ where } \xi = [\alpha,\rho]) \\ u(\sigma) = \beta(\sigma) & (= \eta\sigma, \text{ where } \eta = [\beta,\sigma]) \end{array} \right. \end{array} \right\}$$

so that we have a surjective homomorphism induced by (71)

$$(75) \qquad S\mathcal{G}^{\mathrm{eff}}_{\rho,\sigma} \longrightarrow \Sigma^{\mathrm{eff}}_{\rho,\sigma} \quad .$$

[scan 567]

[p. 587]

We have a canonical map

$$(76) \qquad \left\{ \begin{array}{l} S_0\Gamma_{\rho,\sigma} = Z|\mathbb{Z}_{\rho,\sigma} \times_{\gamma_{\rho,\sigma}} N^*_\rho \times_{\gamma_{\rho,\sigma}} N^*_\sigma \longrightarrow S\mathcal{G}^{\mathrm{eff}}_{\rho,\sigma} \\ \qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad \text{with} \\ \qquad x = \{u,a,b\}|(u,a,b) \longmapsto (\alpha,\beta,\mu) \end{array} \right. \qquad \left\{ \begin{array}{l} \alpha = u\,\overbrace{a^{-1}\tau'^{\nu'(x)}}^{\in Z_\rho} \\ \beta = u\,\underbrace{b^{-1}\tau'^{\nu(x)}}_{\in Z_\sigma} \\ \mu = \chi_{S\Gamma}(x) \end{array} \right.$$

m1238

Marginal note. m1238 to be more correct, one should write

$$\left\{ \begin{array}{l} \alpha = u\, i_\rho(a)^{-1}\tau'^{\nu'(x)} \\ \beta = u\, i_\sigma(b)^{-1}\tau'^{\nu(x)} \end{array} \right.$$

where we have defined $\nu'(x), \nu(x)|\nu'(x) \in \mathbb{Z}/2\mathbb{Z}$ by

$$(-1)^{\nu'(x)} = \varepsilon'(x), \qquad (-1)^{\nu(x)} = \varepsilon(x).$$

By definition of $S_0\Gamma_{\rho,\sigma}$ as a fiber product, we will indeed have $ua^{-1}, ub^{-1} \in \mathcal{G}^+$, hence $\alpha,\beta \in \mathcal{G}$, we will moreover have

$$(77) \qquad \left\{ \begin{array}{l} \alpha(\rho) = u\left(\underbrace{a^{-1}\left(\underbrace{\tau'^{\nu'(x)}(\rho)}_{\rho^{\varepsilon'(x)}} \right)}_{(\rho^{\varepsilon'(x)})^{\varepsilon'(x)} = \rho} \right) = u(\rho), \quad \text{and likewise} \\ \beta(\sigma) = u(\sigma), \end{array} \right. \qquad \text{i.e.} \quad \begin{array}{l} [\alpha,\rho] = [u,\rho] \\ [\beta,\sigma] = [u,\sigma] \end{array}$$

m1239

Marginal note. m1239 N.B. We have, for every $a \in N_\rho^*$, if $\varepsilon_\rho(a) = (-1)^{\nu_\rho(a)}$, $a\tau'^{\nu_\rho(a)} \in Z_\rho$, hence $[ua\tau'^{\nu_\rho(a)}, \rho] = [u, \rho]$. Likewise for σ ...

d2 moreover the condition $\underbrace{[\alpha, \rho]}_{[u,\rho]} = \underbrace{[\beta, \sigma]}_{[u,\sigma]}\varepsilon_1^{\mu-1}$ d3 merely expresses the condition that $u(\varepsilon_0) = \varepsilon_0^\mu$ which enters into the very definition of $Z_{\rho,\sigma}$.

d4 I say that[i1] the map in question (76)[i2] is injective, d5 It suffices to see that when (α, β, μ) are known, we know u — indeed[i3] we d6 in terms of (α, β, μ)[i4]

$$(78) \qquad \begin{cases} \nu'(x) = \nu|\varepsilon_{\mathcal{G}}(\alpha), \quad \nu(x) = \nu|\varepsilon_{\mathcal{G}}(\beta), \quad \chi_{S\Gamma}(x) = \chi_Z(u) = \mu \\ \quad \text{whence} \quad a = \tau'^{\nu|\varepsilon_{\mathcal{G}}(\alpha)}\alpha^{-1}u, \quad b = \tau'^{\nu|\varepsilon_{\mathcal{G}}(\beta)}\beta^{-1}u \end{cases}$$

d9 so if u is known, we also know a and b hence x. On the other hand to determine in terms of α, β, μ,[i5] $u \in Z_{\rho,\sigma} \subset \mathrm{Aut}(\mathcal{G}^+) \times \widehat{\mathbb{Z}}^* \times \{\pm 1\} \times \{\pm 1\}$ it suffices, in addition to (78), to determine d10 d11 the element of $\mathrm{Aut}(\mathcal{G}^+)$ which it defines, which is

Scans 568–586

[scan 568]

immediate from (77). d1We thus havei1 d2

$$(79) \qquad S_0\Gamma_{\rho,\sigma} \hookrightarrow S\mathfrak{G}^{\mathrm{eff}}_{\rho,\sigma}$$

it remains to see that this map is surjective — we have done what was needed for. Let us first note that the composite

$$S_0\Gamma_{\rho,\sigma} \hookrightarrow S\mathfrak{G}^{\mathrm{eff}}_{\rho,\sigma} \xrightarrow{\text{epimorphism}} \Sigma^{\mathrm{eff}}_{\rho,\sigma}(\xrightarrow{\sim} Z_{\rho,\sigma})$$

d3 is none other, by (77) and (71) than d4

$$(80) \qquad x = (u,a,b) \longmapsto (\xi,\eta,\mu,\varepsilon',\varepsilon) \qquad \begin{cases} \xi = [u,\rho] & \text{thus } u(\rho) = \xi\rho \\ \eta = [u,\sigma] & \text{thus } u(\sigma) = \eta\sigma \\ \mu = \chi_{S\Gamma}(x) & \\ \varepsilon' = \varepsilon'(x) & \\ \varepsilon = \varepsilon(x) & \end{cases}$$

thus its d5 composite with $\Sigma^{\mathrm{eff}}_{\rho,\sigma} \xrightarrow{\sim} Z_{\rho,\sigma}$ is none other than the canonical projection

$$S_0\Gamma_{\rho,\sigma} \longrightarrow Z_{\rho,\sigma}$$

$$(u,a,b) \longmapsto u$$

which is surjective, with kernel $SN^*_\rho \times SN^*_\sigma = SZ_\rho \times SZ_\sigma$.

Let us consider on the other hand d6 d7

$$(81) \qquad \begin{cases} \text{operation of } SN_\rho \times SN_\sigma & (a_0,b_0) \in SZ^*_\rho \times SZ^*_\sigma \\ \text{on } \mathfrak{G}_{\rho,\sigma} \subset \mathcal{G} \times \mathcal{G} \times \widehat{\mathbb{Z}}^* & (= SZ_\rho \times SZ_\sigma) \\ \qquad\qquad \| & \text{operates by} \\ \{(\alpha,\beta,\mu) \mid [\alpha,\rho] = [\beta,\sigma]\varepsilon_1^{\mu-1}\} & (\alpha,\beta,\mu) \longmapsto (\alpha a_0, \beta b_0, \mu) \end{cases},$$

It is clear that it operates d11 freely, and that the quotient of $\mathfrak{G}_{\rho,\sigma}$ by this action is identified with $\Sigma_{\rho,\sigma}$, thus we have the result idem for $\mathfrak{G}^*_{\rho,\sigma}$ and $\Sigma^*_{\rho,\sigma}$ d12. Now, for d13 [p. 567]

140-3-s568-D013 *deletion. Manuscript:* (82) for $\varepsilon, \varepsilon'$ $\varepsilon = (-1)^\nu$, $\varepsilon' = (-1)^{\nu'}$ fixed, the action (81) of $SZ'_\rho \times SZ'_\sigma$ corresponds in $S_0\Gamma_{\rho,\sigma}$ to the translationoperation (u, a, b) $(u, a, b) \longmapsto (u, \varepsilon_\rho^{\tau'}(a_0^{-1})a, \varepsilon_\sigma^{\tau'}(b_0^{-1})b)$
Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 569]

[p. 588] d2

$$(82) \qquad \varepsilon = (-1)^\nu, \quad \varepsilon' = (-1)^{\nu'}$$

fixed, the preceding operation of (a_0, b_0) corresponds, under the map (76), to the operation

$$(83) \qquad (u, a, b) \longrightarrow (u, \tau'^{\nu'}(a_0^{-1})a, \tau^{\nu}(b_0^{-1})b) \ ,$$

i.e. to left translation by $(\tau'^{\nu'}, \tau^{\nu})\underbrace{(a_0^{-1}, b_0^{-1})}_{(a_0,b_0)^{-1}}$. Whence surjectivity, and the desired isomorphism

$$(84) \qquad S_0\Gamma_{\rho,\sigma} \xrightarrow{\sim} S\mathfrak{G}^{\mathrm{eff}}_{\rho,\sigma} \qquad (\text{cf. } 76)$$

The left translation by $\ell \in L_0$ in $S_0\Gamma_{\rho,\sigma}$[i2] corresponds, under the preceding bijection, to the [d3]operation[i3]

$$(85) \qquad (\alpha, \beta, \mu) \longmapsto (\ell\alpha, \ell\beta, \mu)$$

which it was clear a priori stabilizes $S\mathfrak{G}^{\mathrm{eff}}_{\rho,\sigma}$. Passing to the quotient, we thus find

$$(86) \qquad \Gamma_{\rho,\sigma} \xrightarrow{\sim} L_0 \backslash S\mathfrak{G}^{\mathrm{eff}}_{\rho,\sigma} \ .$$

Finally, let us consider

$$(87) \quad \begin{cases} S_0 M_{\rho,\sigma} \longrightarrow S\mathfrak{G}^{\mathrm{eff}}_{\rho,\sigma} \times \mathcal{G}^+ = \underbrace{\{\ (\alpha, \beta, \mu, f) \ \mid}_{([\alpha,\rho]=[\beta,\sigma]\varepsilon_1^{\mu-1})} \overbrace{\qquad\qquad}^{(\in \mathcal{G}\times\mathcal{G}\times\widehat{\mathbb{Z}}^*\times\mathcal{G}^+} \\ x = (u, a, b, U) \longmapsto ((\alpha, \beta, \mu), f) \\ \begin{cases} \alpha = ua^{-1}\tau'^{\nu'_\rho(a)} \\ \beta = ub^{-1}\tau'^{\nu_\sigma(b)} \\ \mu = \chi_{SM}(x) \quad (= \chi_Z(u) = \chi_\rho(a) = \chi_\sigma(b) = \chi_G(U)) \\ f = uU^{-1} \end{cases} \end{cases}$$

This map is bijective (trivial by (84)). [p. 568]

[p. 588] ⑰ Functorialities

Let us consider

$$(88) \qquad \mathcal{G} \xrightarrow{\varphi} \mathcal{G}' \qquad \text{surjective homomorphism of profinite groups}$$

let [d1] $\rho_{\mathcal{G}'}, \sigma_{\mathcal{G}'}, \tau'_{\mathcal{G}'}, \ldots$ be the images of $\rho = \rho_{\mathcal{G}}, \sigma = \sigma_{\mathcal{G}}, \tau' = \tau'_{\mathcal{G}}, \ldots$ in $\mathcal{G}'$.

Proposition Equivalent conditions on φ :

a) The map induced by φ

$$(89) \qquad \Sigma^{\mathcal{G}}_{\rho,\sigma} \longrightarrow \Sigma^{\mathcal{G}'}_{\rho,\sigma}$$

[d2] maps[i1] $\Sigma^{\mathcal{G}\,\mathrm{eff}}_{\rho,\sigma}$ into $\Sigma^{\mathcal{G}'\,\mathrm{eff}}_{\rho,\sigma}$.

b) For every $u \in \mathrm{Aut}\,\mathcal{G}^+$, which|that normalizes L_0, and such|such that $u(L_\rho) \underset{\mathcal{G}^+}{\sim} L_\rho$, $u(L_\sigma) \underset{\mathcal{G}^+}{\sim} L_\sigma$, there exists $u' \in \mathrm{Aut}(\mathcal{G}'^+)$ which makes commutative

$$(90) \qquad \begin{array}{ccc} \mathcal{G}^+ & \xrightarrow{\varphi} & \mathcal{G}'^+ \\ {\scriptstyle u}\downarrow & & \downarrow{\scriptstyle u'} \\ \mathcal{G}^+ & \xrightarrow{\varphi} & \mathcal{G}'^+ \end{array},$$

in other words, u [d4] [d5] respects[i2] $\mathrm{Ker}\,\varphi$.

b') idem, assuming only, in place of u normalizing L_0, that $u(L_0) \underset{\mathcal{G}^+}{\sim} L_0$ (plus the other conditions)

c|b) $\exists$ group homomorphism

$$(91) \qquad \varphi_Z : \quad Z^{\mathcal{G}}_{\rho,\sigma} \longrightarrow Z^{\mathcal{G}'}_{\rho,\sigma}$$

[d7] compatible with $\chi, \varepsilon_Z, \varepsilon'_Z$ and such that $\forall u \in Z^{\mathcal{G}}_{\rho,\sigma}$, if u' is its image we have commutativity in (90). (N.B. φ_Z will be [d8] unique by|for ζ|?, and is compatible with $i_{L_0,Z}$) [m1241]

Marginal note. [m1241] thus it induces $\gamma^{\mathcal{G}}_{\rho,\sigma} \longrightarrow \gamma^{\mathcal{G}'}_{\rho,\sigma}$

c') $\exists$ group homomorphism

$$(92) \qquad \varphi_G : \quad G^{\mathcal{G}}_{\rho,\sigma} \longrightarrow G^{\mathcal{G}'}_{\rho,\sigma}$$

compatible with $\chi_G, \varepsilon_G, \varepsilon'_G$ and satisfying the compatibility condition (90). (N.B. this φ_G [p. 569]

[scan 571]

[p. 589] is then unique, and compatible with $i_{\mathcal{G},G}$ $i_{Z,G}$[i1]; [d1]maps[i2] $Z_\rho^{\mathcal{G}}$ into $Z_\rho^{\mathcal{G}'}$, $Z_\sigma^{\mathcal{G}}$ into $Z_\sigma^{\mathcal{G}'}$, which extends to $\varphi_\rho : N_\rho^{\mathcal{G}} \longrightarrow N_\rho^{\mathcal{G}'}$ inducing $N_\rho^{*\mathcal{G}} \longrightarrow N_\rho^{*\mathcal{G}'}$, and extends to $\varphi_\sigma : N_\sigma^{\mathcal{G}} \longrightarrow N_\sigma^{\mathcal{G}'}$ inducing $N_\sigma^{*\mathcal{G}} \longrightarrow N_\sigma^{*\mathcal{G}'}$ ...)
d6 d7

We shall then say that φ is "extendable".

Corollary We can then extend φ to

$$(93) \qquad \varphi_M : S_0 G_{\rho,\sigma}^{\mathcal{G}} \longrightarrow S_0 G_{\rho,\sigma}^{\mathcal{G}'} ,$$

compatible with $\Theta_Z, \Theta_\rho, \Theta_\sigma, \Theta_G$ (taking into account $\varphi_Z, \varphi_\rho, \varphi_\sigma, \varphi_G$), and this in a way "compatible with everything", in particular with diagrams (45) (62).

Example Suppose $\Sigma^{\mathcal{G}'}_{\rho,\sigma} = \Sigma^{\mathcal{G}'\,\mathrm{eff}}_{\rho,\sigma}$, then the conditions of the proposition are automatically satisfied (whatever the surjective homomorphism $\mathcal{G} \longrightarrow \mathcal{G}'$).

Remark It may be that we are given a subgroup $Z^{\natural|\sharp}_{\rho,\sigma} \subset Z^{\mathcal{G}}_{\rho,\sigma}$, and that we consider [d8] condition a) of the proposition only for $u \in Z^{\natural|\sharp}_{\rho,\sigma}$. But with the help of $Z^{\natural|\sharp}_{\rho,\sigma}$, we construct [m1242]

Marginal note. [m1242] We must suppose in addition that $\tau'_Z \in Z^{*}_{\rho,\sigma}$

$$(94)\quad G^{\natural|\sharp}_{\rho,\sigma} = Z^{\natural|\sharp}_{\rho,\sigma} \cdot \mathcal{G}^{+}, \quad Z^{\natural|\sharp}_{\rho} = Z_{\rho} \cap G^{\natural|\sharp}_{\rho,\sigma}, \quad Z^{\natural|\sharp}_{\sigma} = Z_{\sigma} \cap G^{\natural|\sharp}_{\rho,\sigma}$$

whence $N^{\natural|\sharp}_{\rho}$ and $N^{\natural|\sharp *}_{\rho}$, $N^{\natural|\sharp}_{\sigma}$ and $N^{\natural|\sharp *}_{\sigma}$, $\gamma^{\natural|\sharp}_{\rho,\sigma}$, then $S_0 M^{\natural|\sharp}_{\rho,\sigma}$ and $M^{\natural|\sharp}_{\rho,\sigma}$. [d11] This being so, we have an obvious variant of the [p. 570]

proposition, giving conditions for extension|extension of φ to $S_0M^*_{\rho,\sigma} \longrightarrow S_0M^{\mathcal{G}'}_{\rho,\sigma}$.

d1 [p. 571]

Apparatus for this scan

140-3-s572-D001 *deletion. Manuscript:* Universal case

$$\mathcal{G} = \mathrm{Gl}(2,\mathbb{Z})^\wedge, \quad \rho = \begin{pmatrix} 0 & 1 \\ -1 & 1 \end{pmatrix}, \quad \sigma = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}$$

$$\tau' = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}, \quad \{\ \tau = \begin{pmatrix} -1 & 0 \\ 0 & +1 \end{pmatrix}; \quad \varepsilon_0 = \begin{pmatrix} 1 & -1 \\ 0 & 1 \end{pmatrix},$$

We have

$$\varepsilon_1 = \begin{pmatrix} 1 & 0 \\ 1 & 1 \end{pmatrix}^{\varepsilon}.$$

Since ρ
Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 573]

[p. 590]

8°) The universal case $\mathcal{G} = \mathrm{Gl}(2,\mathbb{Z})^\wedge$.

. Let us consider the exact sequence

$$(1) \quad 1 \longrightarrow \{\pm 1\} \longrightarrow \mathcal{N}^\sim_{1,1} \longrightarrow \mathcal{M}^\sim_{0,3} \longrightarrow 1$$
$$\qquad\qquad\qquad\qquad\quad \| \qquad\qquad$$
$$\qquad\qquad\qquad\qquad\quad \mathcal{M} \qquad\qquad$$

d1 We have

$$(2) \qquad \{\pm 1\} = \text{Centr|Centre}(\mathcal{M}) = \text{Centr|Centre}(\widehat{\mathcal{G}}^+),$$

m1243

Marginal note. m1243 we have taken|we have set

$$\mathcal{G} = \mathcal{T}_{1,1}|\mathcal{G}_{1,1} \simeq \mathrm{Gl}(2,\mathbb{Z}),$$
$$\widehat{\mathcal{G}} = \widehat{\mathcal{T}}_{1,1} \simeq \mathrm{Gl}(2,\mathbb{Z})^\wedge,$$
$$\widehat{\mathcal{G}}^+|\mathcal{G}^+ = \mathcal{T}^+_{1,1} = \mathrm{Sl}(2,\mathbb{Z}),$$
$$\widehat{\mathcal{G}}^+ = \mathrm{Sl}(2,\mathbb{Z})^\wedge.$$

whence by (1) a map

$$(3)\quad \mathcal{M}^{\sim}_{0,3} \longrightarrow \mathrm{Aut}(\mathcal{M}) \xrightarrow{\text{restriction to } \mathcal{G}^{+\wedge}=\mathrm{Sl}(2,\mathbb{Z})^{\wedge}} \mathrm{Aut}(\widehat{\mathcal{G}}^{+})$$

[d3] Besides, every automorphism of $\widehat{\mathcal{G}}^{+}$ preserves its center, hence passes to the quotient, whence

$$(4)\quad \mathrm{Aut}(\widehat{\mathcal{G}}^{+}) \longrightarrow \mathrm{Aut}(\widehat{\mathcal{G}}^{+}/\pm 1 \simeq \mathcal{G}^{+\wedge}_{0,3})$$

and the composite|the composite of (3) with (4) is the canonical homomorphism:

$$(5)\quad \begin{array}{ccc} \mathcal{M}^{\sim}_{0,3} & \longrightarrow & \mathrm{Aut}(\widehat{\mathcal{G}}^{+}) \\ & \searrow \quad \swarrow & \\ & \mathrm{Aut}(\widehat{\mathcal{G}}^{+}_{0,3} = \widehat{\mathcal{G}}^{+}/\{\pm 1\}) & \end{array}$$

This shows that (3) is injective, since $\mathcal{M}^{\sim}_{0,3} \longrightarrow \mathrm{Aut}(\widehat{\mathcal{G}}^{+}_{0,3})$ is. [d5]

Remark The map $\mathrm{Aut}(\widehat{\mathcal{G}}^{+}) \longrightarrow \mathrm{Aut}(\mathcal{G}^{+\wedge}_{0,3})$ is not injective on the other hand, [d6] the elements of the kernel correspond to the homomorphisms $\widehat{\mathcal{G}}^{+} \longrightarrow$ Centr|Centre$(\widehat{\mathcal{G}}^{+}) = \{\pm 1\}$,

at once, on [d1]passing:[i1] $\mathcal{G}^{\wedge}_{0,3}/\Pi^{\wedge}_{0,3\mathrm{ab}}$ and noting that $l_0 = \varepsilon_0^2$ would be conjugate to: $(-\varepsilon_0^{\mu})^2 = l_0^{\mu}$, that we must have|which must have from it $\mu = 1$, now ε_0 and $-\varepsilon_0$ are not conjugate even in $\mathrm{Sl}(2, \widehat{\mathbb{Z}})$'|! ...). Now we shall be interested precisely in the automorphisms of|φ $\mathcal{G}^{+\wedge}$ which transform $L_0^{\mathcal{G}}$ into a conjugate subgroup. We shall note|note that on the other hand

$$(12). \qquad \Theta(l_0) = l_0 \qquad \text{hence} \qquad \Theta(L_0^{\Pi}) = L_0^{\Pi}$$

Proposition The homomorphism (3)

$$\mathcal{M}^{\sim}_{0,3} \longrightarrow \mathrm{Aut}(\widehat{\mathcal{G}}^{+})$$

is injective, and its image consists of the automorphisms$u$[i2] of $\widehat{\mathcal{G}}^{+}$ which satisfy the following two conditions

a) u stabilizes $\widehat{\Pi} = \mathcal{G}^{+\wedge}[2] = \mathrm{Ker}(\mathcal{G}^{+\wedge} \longrightarrow \mathrm{Sl}(2, \mathbb{Z}/2\mathbb{Z}))$

b) u transforms $L_0^{\mathcal{G}}$ into a subgroup of $\mathcal{G}^{+\wedge}$ $\mathcal{G}^{+\wedge}$-conjugate to L_0; i.e. $\exists \mu \in \widehat{\mathbb{Z}}^{*}$ and $f_0 \in \mathcal{G}^{+\wedge}$ such that we have

$$(13) \qquad u(\varepsilon_0) = \mathrm{int}(f_0^{-1})(\varepsilon_0^{\mu}).$$

Proof. Injectivity has already been seen. [d2]Let us show[i3] that conditions a)b) are necessary for u to [d3]come[i4] from a $u_0 \in \mathcal{M}^{\sim}_{0,3}$, [d4] a) this is trivial, since u_0 stabilizes $\Pi^{\wedge|\sim}_{0,3}$, hence its

[scan 576]

inverse image in $\mathcal{G}^{+\wedge}$. For condition b), we are reduced to the case where $u_0 \in \mathcal{M}^{\sim}_{0,3}[0]$ (conjugating if necessary by an element of $\mathcal{G}^{+\wedge}_{0,3} \simeq \mathcal{G}^{+\wedge}/\pm 1$), in this case we have by construction of $\mathcal{N}^{\sim}_{1,1}$ from $\mathcal{M}^{\sim}_{0,3}$ (cf. $\overline{\underline{\text{III}}}$, pages|pages 665...)

$$(14) \qquad u_0(\varepsilon_0) = \varepsilon_0^{\mu}$$

where $\mu \in \widehat{\mathbb{Z}}^*$ is the multiplier, OK.

Conversely, let u be an automorphism of $\mathcal{G}^{+\wedge}$ which satisfies a),b), consider the automorphism $\tilde{u}$ of $\mathcal{G}^{+\wedge}/\pm 1 \simeq \mathcal{G}^{+\wedge}_{0,3}$ which it induces. We thus see that $\tilde{u}(\Pi^{\wedge}_{0,3}) = \Pi^{\wedge}_{0,3}$, and that $\tilde{u}(\varepsilon_0)$ is $\mathcal{G}^{\wedge}_{0,3}$-conjugate to an ε_0^{μ} ($\mu \in \widehat{\mathbb{Z}}^*|\widehat{\mathbb{Z}}$). [d1] Thus by definition, we have $\tilde{u} \in \mathcal{M}^{\sim}_{0,3}$ (cf. pages|pages 390 ff). Let u' be the automorphism of $\mathcal{G}^{+\wedge}$ induced by $\tilde{u}$ (via (3)) – then u' and u induce the same automorphism of $\mathcal{G}^{+\wedge}_{0,3} = \mathcal{G}^{+\wedge}/\{\pm 1\}$, thus we will have $u' = u \circ \Theta$, where $\Theta = u^{-1}u'$[i1] is an automorphism which

1°) induces the identity on $\mathcal{G}^{+\wedge}/\{\pm 1\}$, and

2°) takes $L_0^{\mathcal{G}}$ to a conjugate subgroup

– we have seen that this implies $\Theta = 1$, q.e.d.

[d2] Let us now consider the exact [d3]sequence[i2]

$$(15) \quad 1 \longrightarrow \pm 1 \longrightarrow \widehat{\Pi} \longrightarrow \Pi^{\wedge}_{0,3} \longrightarrow 0$$

$$\Vert$$

$$\mathcal{G}^{+\wedge}[2]$$

[p. 592]

and consider the splitting given by

$$(16)\quad \begin{cases} \Pi_{0,3} \longrightarrow \Pi = \mathcal{G}^+[2] = \mathrm{Ker}(\mathrm{Sl}(2,\mathbb{Z}) \longrightarrow \mathrm{Sl}(2,\mathbb{Z}/2\mathbb{Z})) \\ \\ l_i \longmapsto \lambda_i \overset{\text{dfn}}{=} -l_i \end{cases}$$

There [d2] is such a homomorphism, by virtue of

$$(17)\quad \begin{cases} (-l_\infty)(-l_1)(-l_0) = 1 \quad \text{in } \mathrm{Sl}(2,\mathbb{Z}) \quad \text{i.e.} \\ l_\infty l_1 l_0 = -1 \end{cases}$$

)

and it is obvious that this is a splitting. We also likewise have a splitting for $\widehat{\Pi}$ over $\widehat{\Pi}_{0,3}$. We denote by Π_0 the image of 16), i.e.

$$(18)\quad \begin{cases} \Pi_0 = \text{subgroup of } \Pi = \mathcal{G}^+[2] \text{ generated by} \\ \quad \lambda_0, \lambda_1, \lambda_\infty \qquad (\text{where } \lambda_i = -l_i) \end{cases}$$

and we thus have a subgroup $\widehat{\Pi}_0$ of $\widehat{\Pi}$.

Proposition a) The subgroup Π_0 of Π is [d3]of index[i2] 2, and it is normal in $\mathcal{G}^{\wedge|*}$.

b) The subgroup $\widehat{\Pi}_0$ of $\widehat{\Pi}$ is [d4]of index 2[i3], and it is normal in $\mathcal{M}$ – or, what amounts to the same, stable under the action of $\mathcal{M}/\pm 1 \simeq \mathcal{M}^{\sim}_{0,3}$.

Proof Since

$$(19)\quad \begin{cases} \rho(\lambda_i) = \lambda_{i+1} \\ \sigma(\lambda_0) = \lambda_1, \quad \sigma(\lambda_1) = \lambda_0 \\ \tau(\lambda_0) = \lambda_0^{-1}, \quad \tau(\lambda_1) = \lambda_1^{-1} \end{cases}$$

m1246

$$\sigma(\lambda_\infty) = \sigma(\lambda_1\lambda_0)^{-1} = \lambda_1^{-1}\lambda_0^{-1}$$

Marginal note. m1246

$$\tau(\lambda_\infty) = \tau(\lambda_1\lambda_0)^{-1} = \lambda_0\lambda_1$$

we see that Π_0 is [d9] normalized by ρ, σ, τ, hence by $\mathcal{G}$. That it is of index 2 is obvious. Thus $\widehat{\Pi}_0$ is of index 2 in $\widehat{\Pi}$ and normalized by $\widehat{\mathcal{G}}$. To see that it is [p. 576]

[scan 578]

normalized by $\mathcal{M}$ in its full entirety, since

$$\mathcal{M} = \mathcal{M}(0)\,.\,\mathcal{G}^{+\wedge},$$

we are reduced to verifying that it is normalized by $\mathcal{M}(0) \simeq \mathcal{M}^{\sim}_{0,3}(0)$. Now we have, for $u \in \mathcal{M}^{\sim}_{0,3}(0)$

$$(20) \qquad \begin{cases} u(\rho) = \mathrm{int}(\alpha)\rho \\ u(\sigma) = \varepsilon_2\,\mathrm{int}(\beta)\sigma \\ u(\varepsilon_0) = \varepsilon_0^{\mu} \end{cases} \qquad \begin{cases} \varepsilon_2 = \varepsilon_2(\mu) \\ \alpha, \in \widehat{\Pi}\,.\,\{1,\tau\} \\ \beta \in \widehat{\Pi} \end{cases}$$

whence

$$(21) \qquad \begin{cases} u(\ell_0) = \ell_0^{\mu} \\ u(-\ell_0) = (-\ell_0)^{\mu} \end{cases} \quad \text{i.e.} \quad u(\lambda_0) = \lambda_0^{\mu} \quad (\text{since } (-1)^{\mu} = -1)$$

)

d4 d5 thus $u(\lambda_0) \in \widehat{\Pi}_0$, it remains to prove that $u(\lambda_1) \in \widehat{\Pi}_0$, now

$$u(\lambda_1) = u(\rho(\lambda_0)) = \underbrace{(u\rho)}_{(\mathrm{int}(\alpha)\rho)u}(\lambda_0) = \mathrm{int}(\alpha)(\rho)\left(\underbrace{u(\lambda_0)}_{\lambda_0^{\mu}}\right) = .$$

d8 and since $\widehat{\Pi}_0$ is normalized by $\mathcal{G}^{\wedge}$ and in particular by $\alpha\rho\alpha^{-1}$, we indeed find $u(\lambda_1) \in \Pi_0$.

Corollary We have

$$(22) \qquad \begin{cases} \Pi \simeq \Pi_0 \times \mu \\ \widehat{\Pi} \simeq \widehat{\Pi}_0 \times \mu \end{cases}$$

where $\mu = \{\pm 1\} = \mathrm{Centr}(\mathcal{G}^{+\wedge})$.

d10 This is trivial, since we have a splitting of the central extension (15).i3

[scan 579]

[p. 593]

Let|Let

$$\begin{cases} \mu_\tau = \{1, \tau\} \subset \mathcal{G} & D_\tau = \mu_\tau \times \mu \subset \mathcal{G} \\ \mu_\sigma = \{1, \sigma|\tau'\} \subset \mathcal{G} & D_\sigma = \mu_\sigma \times \mu \subset \mathcal{G} \end{cases} \tag{23}$$

so that we have

$$\begin{aligned} D_\tau \cap \mathcal{G}^+ = D_\tau \cap \Pi = \mu \quad D_\tau \cap \Pi_0 = \{1\} \\ D_\sigma \cap \mathcal{G}^+ = D_\sigma \cap \Pi = \mu \quad D_\sigma \cap \Pi_0 = \{1\}, \end{aligned} \tag{24}$$

We set

$$\begin{cases} \Pi_\tau = \mu_\tau \,.\, \Pi = D_\tau \,.\, \Pi_0, & \Pi_{0\tau} = \mu_\tau \,.\, \Pi_0 \\ \Pi_\sigma = \mu_\sigma \,.\, \Pi = D_\sigma \,.\, \Pi_0, & \Pi_{0,\sigma} = \mu_\sigma \,.\, \Pi_0 \end{cases} \tag{25}$$

idem on replacing $\mathcal{G}, \Pi$ by $\mathcal{G}^\wedge, \widehat{\Pi}$

so that we have

$$(26) \qquad \begin{cases} \Pi_\tau = \Pi_{0\tau} \times \mu \\ \Pi_\sigma = \Pi_{0,\sigma} \times \mu \end{cases},$$

and idem on putting in $\wedge$'s.

Normalization of α, β The relations 20, determine α, β only "modulo sign". We remove this ambiguity by taking

$$(27) \qquad \alpha \in \Pi_{0,\tau}, \qquad \beta \in \Pi_0.$$

The group $\mathcal{G}/\Pi_0$. It is described by generators ρ, σ, τ' and relations by

$$(28) \qquad \begin{cases} \rho^6 = \sigma^4 = \tau^2 = 1, \quad \rho^3 = \sigma^2 \\ \tau(\rho) = \sigma(\rho^{-1}), \quad \tau(\sigma) = \sigma^{-1} \\ \tau(\rho) = \rho \end{cases}$$

For we have

$$(29) \qquad \tau(\rho) = (-\ell_1^{-1})\rho$$

thus the last relation 28 reads $-\ell_1^{-1} = 1$ i.e. $\lambda_1 = 1$ (and implies $\lambda_\infty = \lambda_0 = 1$ on applying ρ).

[p. 578]

Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

[scan 580]

In terms of ρ, σ, τ' we find likewise

$$(30) \qquad \begin{cases} \rho^6 = \sigma^4 = \tau'^2 = 1, \quad \rho^3 = \sigma^2 \\ \tau'(\rho) = \rho^{-1}, \quad \tau'(\sigma) = \sigma^{-1} \\ \sigma(\rho) = \rho^{-1} \end{cases}$$

The subgroup $\mathcal{G}^+/\Pi_0$ has the presentation in ρ, σ

$$(31) \qquad \left\{ \begin{matrix} \rho^6 = \sigma^4 = 1, \quad \rho^3 = \sigma^2 \\ \sigma(\rho) = \rho^{-1} \end{matrix} \right\}$$

What is the operation of $\mathcal{M}^{\sim}_{0,3} \simeq \mathcal{M}/\pm 1$ on $\mathcal{G}^+/\Pi_0$? [d1] We have a structure[i1] of extension

$$(32) \qquad \begin{array}{ccccccccc} 1 & \longrightarrow & \mu & \longrightarrow & \mathcal{G}^+/\Pi_0 & \longrightarrow & \mathcal{G}^+/\Pi & \longrightarrow & 1 \\ & & \| & & & & \| & & \\ & & \pm 1 & & & & \mathcal{G}_3 & & \end{array}$$

and the automorphisms in question preserve this extension structure. The elements|elements of $\mathcal{M}^{!\sim}_{0,3} \simeq \mathcal{M}^{!}/\{\pm 1\}$ operate by inducing the identity in the quotient $\mathcal{G}_3$, and of course also in μ — now such an automorphism of the extension corresponds to a homomorphism

$$(33) \qquad \begin{array}{ccc} \mathcal{G}_3 & \longrightarrow & \mu \\ & & \| \\ & & \pm 1 \end{array} \qquad \text{i.e.} \qquad \mathcal{G}_{3\,\mathrm{ab}} \longrightarrow \mu$$

now

$$\mathcal{G}_{3\,\mathrm{ab}} \xrightarrow{\mathrm{sg}} \{\pm 1\} = \mu$$

thus the group of automorphisms of $\mathcal{G}^{+}/\Pi_0$ inducing the identity in $\mathcal{G}_3$ is $\simeq \mathbb{Z}/2\mathbb{Z}$, a generator Θ^{i2} is given by

$$(34) \qquad \Theta(x) = \mathrm{sg}(x)\,.\,x \quad \text{thus} \quad \begin{cases} \Theta(\rho) = \rho \\ \Theta(\sigma) = -\sigma \end{cases}$$

[scan 581]

[p. 594]

Comparing with the formulas (20), we find

$$(35) \qquad u\big|_{\mathcal{G}^{+\wedge}/\widehat{\Pi}_0} = \Theta^{\varepsilon_2(u)} : \begin{array}{l} \dot\rho \longmapsto \dot\rho \\ \dot\sigma \longmapsto \varepsilon_2(u)\dot\sigma \end{array}$$

i.e.

$$(35\text{ bis}) \qquad \begin{array}{c} [\dot u, \dot\sigma] \\ \| \\ \dot u(\dot\sigma)\dot\sigma^{-1} \end{array} = \varepsilon_2(u)^{\cdot} \quad \text{in } \mathcal{G}/\Pi_0.$$

m1249

Marginal note. m1249 This can also be written $[\dot u, \dot x] = \mathrm{sg}(x)^{\nu_2(u)}$ in $\mathcal{G}^{+\wedge}/\Pi_0$ $(u \in \mathcal{M}^{!}, x \in \mathcal{G}^{+\wedge})$ (careful, this goes wrong|does if we assume there for $u \in \mathcal{M}^{!}$ only $u \in \mathcal{M}$ ...)

d2 Let us take up again the definition

$$(36) \qquad Z = Z_{\rho,\sigma} \overset{\mathrm{dfn}}{=} \left\{ u \in \mathrm{Aut}(\mathcal{G}^{+\wedge}) \;\middle|\; \begin{array}{l} u(L_\rho)\ \mathcal{G}^{+\wedge}\text{-conjugate to } L_\rho \\ u(L_\sigma)\ \mathcal{G}^{+\wedge}\text{-conjugate : } L_\sigma \\ u(L_0) = L_0 \end{array} \right\}$$

so that we shall have, for $u \in Z$

$$(37) \qquad \begin{cases} u(\rho) & \mathcal{G}\text{-conjugate to } \rho^{\varepsilon'} \\ u(\sigma) & \mathcal{G}\text{-conjugate to } \sigma^{\varepsilon} \quad (= \varepsilon\sigma) \\ u(\varepsilon_0) = \varepsilon_0^{\mu} \end{cases}$$

with $\mu \in \widehat{\mathbb{Z}}^*$ and $\varepsilon, \varepsilon' \in \{\pm 1\}$ well determined, (for

$$\widehat{\mathbb{Z}} \longrightarrow \mathcal{G}$$

$$n \longmapsto \varepsilon_0^n$$

is injective, ρ and ρ^{-1} are not $\mathcal{G}^{+\wedge}$-conjugate, nor σ and σ^{-1}). I say that such a u comes from $\mathcal{M}_{0,3}^{\sim}$ — it remains to check, by virtue of the proposition..., that u stabilizes $\widehat{\Pi}$, which is generated by $\ell_0, \ell_1, \ell_\infty$. Now we shall have

$$u(\ell_0) = \ell_0^{\mu} \in \widehat{\Pi}$$

and

$$u(\ell_1) = \underbrace{u\rho}\quad(\ell_0) = \mathrm{int}(f)(\rho^{\varepsilon'})(u(\ell_0)) = \mathrm{int}(f)(\rho)^{\varepsilon'}(\ell_0^{\mu})$$

$$\begin{matrix} \mathrm{int}(f)(\rho^{\varepsilon'})u \\ f \in \mathcal{G}^{+\wedge} \end{matrix}$$

now $\mathcal{G}^{\wedge}$ and a fortiori $\mathrm{int}(f)(\rho)^{\varepsilon'}$ normalizes $\widehat{\Pi}$, thus [d7] $u(\ell_1) \in \widehat{\Pi}$ and since $u(-1) = -1$, whence:[i5]

$$u(\ell_\infty) = -u(\ell_1\ell_0)^{-1} = -u(\ell_0^{-1})u(\ell_1)^{-1}$$

we also have $u(\ell_\infty) \in \Pi$, OK.

If we identify u with an element of $\mathcal{M}_{0,3}^{\sim}$, we see that [d8] in fact [d9]

[scan 582]

$$u\in\mathcal{M}^{\sim}_{0,3}[0]\simeq\mathcal{M}^{!}[0]\subset\mathcal{M}$$

m1250

Marginal note. m1250 Careful we had not previously introduced $\mathcal{M}^{\sim}_{0,3}|\mathcal{M}_{0,3}[0]$, but only $\mathcal{M}^{!\sim}_{0,3}[0]\subset\mathcal{M}^{!\sim}_{0,3}$. Now it is not true that we shall have here $u\in\mathcal{M}^{!\sim}_{0,3}$, for example we may have $u=\varepsilon_0$. The image of u in $\mathcal{G}_3$ is in d1 $\{1,\dot\sigma_0\}$, thus by correcting by ε_0 i1, we shall have an element of $\mathcal{M}^{!\sim}_{0,3}[0]$. d2 Cf. more detailed correction on page 609 ff. $Z^{!}_{\rho,\sigma}=\mathcal{M}^{!}[0]=Z_{\rho,\sigma}\cap\mathcal{M}^{!}$.

d3 thus (20), more precisely

$$(38)\qquad \begin{cases} u(\rho)=\mathrm{int}(\alpha)\rho \\ u(\sigma)=\varepsilon_2\,\mathrm{int}(\beta)\sigma \\ u(\varepsilon_0)=\varepsilon_0^{\mu}\end{cases}\qquad \text{with}\quad \alpha\in\widehat{\Pi}_{0\tau},\ \beta\in\widehat{\Pi}_0,\ \begin{cases}\mu\in\widehat{\mathbb{Z}}^*\end{cases}$$

in their turn imply|implying (37). In fact the formulas (38)i2 for $u(\rho),u(\sigma),u(\varepsilon_0)$ uniquely determine $\mu\in\widehat{\mathbb{Z}}^*$, $\varepsilon_2\in\{\pm1\}$, $\alpha\in\widehat{\Pi}_{0,\tau}$, $\beta\in\widehat{\Pi}_0$, and we shall then necessarily have

$$(39)\qquad \varepsilon_2=\varepsilon_2(\mu),\qquad \varepsilon_\tau(\alpha)=\varepsilon_3(\mu)$$

where ε_τ is the homomorphism that occurs in the exact[i3] sequence

$$(40)\qquad 1\longrightarrow\widehat{\Pi}_0\longrightarrow\widehat{\Pi}_{0,\tau}\xrightarrow{\varepsilon_\tau}\{\pm1\}\longrightarrow 1\quad .$$

Thus we have proved

Proposition In the universal case ($\mathcal{G} = \mathcal{G}^{+\wedge}$) we have

$$Z^!_{\rho,\sigma} \xleftarrow{\sim} \mathcal{M}^![0] \overset{\text{dfn}}{=} \mathcal{M}^{!\sim}_{0,3}[0] \quad ,$$

the components $u, \mu, \varepsilon', \varepsilon$ of an element of $Z^!_{\rho,\sigma}$ correspond resp. (in terms of $u_0 \in \mathcal{M}[0]$): u_0 identified with an element of $\mathrm{Aut}(\mathcal{G}^{+\wedge})$, $\mu = \chi(u_0)$ (the multiplier of u_0), $\varepsilon = \varepsilon_3(\mu)$, $\varepsilon' = \varepsilon_2(\mu)$.

Corollary We have

$$G_{\rho,\sigma} \simeq \mathcal{M} = \mathcal{N}^\sim_{1,1},$$
$$\gamma_{\rho,\sigma} \simeq \mathcal{M}/\mathcal{G}^{+\wedge} \simeq \mathcal{N}^\sim_{1,1}/\mathcal{G}^{+\wedge} \simeq \mathcal{M}^\sim_{0,3}/\mathcal{G}^{+\wedge}_{0,3} \simeq \Gamma^\sim_{\mathbb{Q}}.$$

[scan 583]

[p. 595]

Remark It is tempting to write the first two[i1] relations (38) in the form

$$(41) \qquad \begin{cases} (\alpha^{-1}u)(\rho) = \rho & \text{i.e.} \quad \alpha^{-1}u \in Z^\sharp_\rho \\ (\beta^{-1}u)(\sigma) = \varepsilon_2\sigma & \text{whence|i.e.} \quad \beta^{-1}u \in N'_\sigma \end{cases}$$

and then to introduce

$$(42)\qquad \begin{cases} a = \alpha^{-1}u \in Z_\rho^\sharp, & \text{thus } u = \alpha a, \quad \alpha = ua^{-1} \\ b = \beta^{-1}u \in N'_\sigma, & \text{thus } u = \beta b, \quad \beta = ub^{-1}, \end{cases}$$

and the developments of § 48 (notably XI) may lead one to expect that the quantities a, b, for $u \in \mathcal{M}[0]$ variable, depend multiplicatively on u. We are going to see however that this is not so.

Let indeed

$$\delta : \quad G_{\rho,\sigma} \xrightarrow{\sim} \mathcal{M} \longrightarrow \gamma_{\rho,\sigma} \simeq \Gamma_{\mathbb{Q}}$$

be the canonical homomorphism, so that we will have

$$(43)\qquad \delta(u) = \delta(b) = \tau_\gamma^{\nu_3}\delta(a),$$

putting

$$\tau_\gamma = \delta(\tau), \qquad \varepsilon_3 = (-1)^{\nu_3} \quad (\nu_3 \in \mathbb{Z}/2\mathbb{Z})$$

If u' corresponds to b', a', ν_3'[i2], we will likewise have

$$(43\,\text{bis})\qquad \delta(u') = \delta(b') = \tau_\gamma^{\nu'_3}\delta(a')$$

and if $u'' = u'u$ corresponds to a'', b'', ν_3'',

$$(43\,\text{ter})\qquad \delta(u'u) = \delta(b'') = \tau_\gamma^{\nu''_3}\delta(a''),$$

In fact, we will have

$$(44)\qquad \begin{array}{l} b'' = b'b, \quad \nu_2'' = \nu_2' + \nu_2 \quad \text{and.}|\text{and} \quad \nu_3'' = \nu_3' + \nu_3 \\ (\text{i.e. } \varepsilon_2'' = \varepsilon_2'\varepsilon_2 \quad \text{and} \quad \varepsilon_3'' = \varepsilon_3'\varepsilon_3) \end{array}$$

We have seen

$$\begin{aligned} u(\sigma) &= \varepsilon_2 \operatorname{int}(\beta)\sigma \\ u'(\sigma) &= \varepsilon_2' \operatorname{int}(\beta')\sigma \end{aligned}$$

whence

$$\begin{aligned} (u'u)(\sigma) = u'(u(\sigma)) &= \varepsilon_2 \operatorname{int}(u'(\beta))u'(\sigma) \\ &= \varepsilon_2\varepsilon_2' \operatorname{int}(u'(\beta)\beta')\sigma \end{aligned}$$

with $u'(\beta)\beta' \in \widehat{\Pi}_0$, which by uniqueness proves

$$(45) \qquad \beta'' = u'(\beta)\beta', \qquad \varepsilon''_2 = \varepsilon'_2\varepsilon_2$$

whence we indeed conclude

$$\begin{array}{ccc} b'' & = & \underbrace{b'}_{\beta'^{-1}u'}\ \underbrace{b}_{\beta^{-1}u} \\ \| & & \\ \beta''^{-1}u'' = \beta''^{-1}(u'u) & & \end{array}$$

i.e. $\beta''^{-1}u'u = \beta'^{-1}u'\beta^{-1}u$ i.e. $\beta''^{-1} = \beta'^{-1}u'(\beta^{-1})$
i.e. $\beta'' = u'(\beta)\beta'$ which is none other than (45).

The relation $\varepsilon''_3 = \varepsilon'_3\varepsilon_3$ is also evident, for example from the relation (which contains ε_3, and likewise $\varepsilon'_3, \varepsilon''_3$

$$(46) \qquad u(\rho)\ \mathcal{G}^{+\wedge}\text{-conjugate to } \rho^{\varepsilon_3}.$$

d4

It remains therefore to examine the hypothetical relation

$$a'' = a'a$$

which [d5] implies

$$(*) \qquad \delta(a'') = \delta(a')\delta(a)$$

but comparing (43) (43 bis) (43 ter) we find the relation

$$\delta(u')\delta(u) = \tau_\gamma^{\nu'_3}\delta(a')\tau_\gamma^{\nu_3}\delta(a)$$

$$\delta(u'u''|u) = \tau_\gamma^{\nu''_3}\delta(a'')$$

i.e. [p. 583]

[scan 585]
d1 [p. 596]

d2

$$\tau_\gamma^{\nu'_3+\nu_3}\delta(a'') = \tau_\gamma^{\nu'_3}\delta(a')\tau_\gamma^{\nu_3}\delta(a)$$

or again

$$\delta(a'') = \tau_\gamma^{\nu_3}\delta(a')\tau_\gamma^{\nu_3}\delta(a)$$

i.e.

$$(47) \qquad \delta(a'') = \tau_\gamma^{\nu_3}(\delta(a')) \cdot \delta(a).$$

Thus the relation (*) is equivalent to

$$(48) \qquad \begin{array}{lll} \delta(a') = \tau_\gamma^{\nu_3}(\delta(a')) & \text{i.e.} & [\delta(a'), \tau_\gamma^{\nu_3}] = 1 \\ & \text{i.e.} & [\delta(u'), \tau_\gamma^{\nu_3}] = 1 \end{array}$$

since $\delta(u) = \tau_\gamma^{\nu_3}\delta(a)$

This shows that if $\nu_3 = 1$ i.e. $\varepsilon_3 = -1$, then the relation (*) is equivalent to the commutation d9 of $\delta(u')$ d10 with τ_γ, d11. It is a draconian condition on an element of $\Gamma_{\mathbb{Q}}^{\sim}$ that|which, for an element of $\Gamma_{\mathbb{Q}}$ itself in its version, implies that $u' \in \{1, \tau_\gamma\}$ — and by heuristic arguments, we have seen that it should even be so for every element of $\Gamma_{\mathbb{Q}}^{\sim}$. It appears that the success of the presentation of § 48 XI is due to the fact that in the situations|the situation considered|considered in the|the cases, the group $\gamma_{\rho,\sigma} \simeq \widehat{\mathbb{Z}}^*$ was commutative, or τ_γ central.i2 Outside this case, the quantity

$$a = \alpha^{-1}u \in Z_\rho^\sharp \hookrightarrow G_{\rho,\sigma}$$

depends multiplicatively on the element $u \in \mathcal{M}^!{}[0]$, only on condition of restricting oneself to $u \in \mathcal{M}^!{}[0]'$. →

[scan 586]

We are going to try to salvage things, by finding a canonical homomorphism

$$\begin{array}{ccc} \mathcal{M}^![0] & \longrightarrow & \underbrace{Z^!_{\rho,\sigma} \times_{\gamma_{\rho,\sigma}} N^*_\rho \times_{\gamma_{\rho,\sigma}} N^*_\sigma}_{S_0\Gamma^!_{\rho,\sigma} \underset{\text{index } 2}{\subset} S_0\Gamma_{\rho,\sigma}} \\ \| & & \\ Z^!_{\rho,\sigma} & & \end{array}$$

m1253

Marginal note. m1253 N.B. we have

$$S_0\Gamma^!_{\rho,\sigma}/L^\Pi_0 \xrightarrow{\sim} S_0\Gamma_{\rho,\sigma}/L^{\mathcal{G}}_0$$

then

$$\gamma_{\rho,\sigma} \xrightarrow{\sim} \Gamma^{\sim}_{\mathbb{Q}}.$$

Let us note that the second side|set is formed of the triples

$$\begin{array}{lccc} (49) & \{(u, & a, & b) \mid \\ & \cup & \cup & \cup \\ & \mathcal{M}[0] & N'_\rho & N'_\sigma \end{array} \qquad u = fb = f'a, \text{ with } f, f' \in \mathcal{G}^{+\wedge} \text{ suitable}\}$$

$$\text{which implies} \quad \begin{matrix} \varepsilon_2(u) = \varepsilon_\sigma(b) \\ \varepsilon_3(u) = \varepsilon_\rho(a) \end{matrix}$$

and for such a triple, we will have

$$(49\text{ bis}) \quad \begin{cases} u(\sigma) = \mathrm{int}(fb)(\sigma) = \mathrm{int}(f)\ \underbrace{\mathrm{int}(b)(\sigma)}_{\varepsilon_2(b)(\sigma)} = \varepsilon_2(u)\,\mathrm{int}(f)(\sigma) \\ u(\rho) = \mathrm{int}(f')(\rho^{\varepsilon_3(u)}) = \mathrm{int}(f')\varepsilon_3(\tau')(\rho) = \mathrm{int}(f'\varepsilon_3(\tau'))(\rho) \end{cases}$$

where we put

$$\varepsilon_3(\tau') \overset{\text{dfn}}{=} \begin{cases} 1 & \text{if } \varepsilon_3 = +1 \\ \tau' & \text{if } \varepsilon_3 = -1 \end{cases} \qquad \begin{matrix} \text{i.e. } \varepsilon_3(\tau') = \sigma^{\nu_3} \\ \text{if } \varepsilon_3 = (-1)^{\nu_3} \end{matrix}$$

If u corresponds to α, β (cf. (38)), the formulas (49 bis) are written also|thus respectively

$$\begin{cases} \mathrm{int}(f)(\sigma) = \mathrm{int}(\beta)(\sigma) & \text{i.e.} \quad f = \beta\sigma^i \quad (i \in \mathbb{Z}/4\mathbb{Z}) \\ \mathrm{int}(f'\varepsilon_3(\tau'))(\rho) = \mathrm{int}(\alpha)(\rho) & \text{i.e.} \quad \underbrace{f'\varepsilon_3(\tau') = \alpha\rho^j}_{j \in \mathbb{Z}/6\mathbb{Z}} \end{cases}$$

Thus we find

Proposition For a fixed $u \in Z^!_{\rho,\sigma} = \mathcal{M}[0] \simeq \widetilde{\mathcal{M}}_{0,3}[0]$, the $(u, a, b) \in S_0\Gamma_{\rho,\sigma}$ over u are exactly the elements [d8]of[i3]

$$(50) \quad \left\{ (u,a,b) \;\middle|\; \begin{matrix} a = f'^{-1}u & \text{with} & f' = \alpha\rho^j\varepsilon_3(\tau') & (j \in \mathbb{Z}/6\mathbb{Z}) \\ b = f^{-1}u & \text{with } f = \beta\sigma^i & & (i \in \mathbb{Z}/4\mathbb{Z}) \end{matrix} \right\}$$

m1254

Marginal note. [m1254] where $\alpha, \beta, \varepsilon_2, \varepsilon_3$ are defined for u via (38)

[d9]Let us consider[i5] then the element (u, a, b)[i6] over u having the simplest expression in terms of α, β, by taking $i = 0|j,\ j = 0$, thus corresponding to the choices: [p. 585]

Scans 587–605

[scan 587]

[p. 597]

$$(51)\qquad \begin{cases} a = \varepsilon_3(\tau')\alpha^{-1}u & \text{i.e.} \quad \alpha = ua^{-1}\varepsilon_3(\tau') \\ b = \beta^{-1}u & \text{i.e.} \quad \beta = ub^{-1} \end{cases},$$

I wonder whether this set-theoretic section of $S_0\Gamma^!_{\rho,\sigma}$ over $Z^!_{\rho,\sigma} = M^!{}[0]$ is multiplicative, or, which amounts to the same thing, whether a and b defined by (51) depend multiplicatively on [d1] u.

Proposition. Let $(u, a, b) \in S_0\Gamma^!_{\rho,\sigma}$ (cf. (50)). For us to have $i = 0$, $j = 0$, i.e. for us to have (51) — i.e. for (u, a, b) [d2] to belong to the preceding set-theoretic section — it is necessary and sufficient that we have the relations

$$(52)\qquad u \equiv b \equiv \varepsilon_3(\sigma)a \mod \widehat{\Pi}_0.$$

m1255

Marginal note. m1255

m1256

Marginal note. m1256 where we have put $\varepsilon_3(\sigma) = \begin{cases} 1 & \text{if } \varepsilon_3 = +1 \\ \sigma & \text{if } \varepsilon_3 = -1 \end{cases}$

N.B.
$\tau'\tau = \sigma^{-1}$
$\tau'\sigma^{-1} = \tau.$

Proof. Since $\beta = ub^{-1}$ and d5 $\alpha\varepsilon_3(\tau) = ua^{-1}\varepsilon_3(\tau'\tau) = ua^{-1}\varepsilon_3(\sigma^{-1})$i2 are both in $\widehat{\Pi}_0$, the condition is necessary. For sufficiency, we note that (52) reads, with the notation of (50), where $f = ub^{-1}$, $f' = ua^{-1}$ i.e. $f'\varepsilon_3(\sigma^{-1}) = ua^{-1}\varepsilon_3(\sigma^{-1})$ d8i3 d9,

$$(53) \quad f, f'\varepsilon_3(\sigma^{-1}) \in \Pi_0$$

d11i4 and reducing modulo Π_0 in $\widehat{G}/\Pi_0$ this reads $\dot\beta\dot\sigma^i = 1$ and d12, $\dot\alpha\dot\rho^j\varepsilon_3(\tau'\sigma^{-1})^{\cdot} = 1$, this last relation also reads $\dot\alpha\dot\rho^j\varepsilon_3(\tau)^{\cdot} = 1$ i.e.i5 d13 $\varepsilon_3(\dot\tau)\dot\alpha\dot\rho^j = 1$, d14 $\varepsilon_3(\dot\tau)\dot\alpha\dot\rho^j = 1$ now $\varepsilon_3(\dot\tau)\dot\alpha = 1$, the condition is d15

$$\dot\sigma^i = \dot\rho^j = 1 \qquad \text{i.e.} \quad i = 0,\ j = 0$$

[scan 589]

[p. 598]

$$(54) \qquad \varepsilon_3(\sigma)(a') \equiv \varepsilon a' \quad (\Pi_0|\widehat{\Pi}_0), \quad \text{where} \begin{cases} \varepsilon \in \{\pm 1\}, \quad \varepsilon \overset{\text{dfn}}{=} -1 \text{ iff } \varepsilon_3 = \varepsilon'_3 = -1 \\ \varepsilon_3(\sigma) \overset{\text{dfn}}{=} \begin{cases} 1 & \text{if } \varepsilon_3 = +1 \\ \sigma & \text{if } \varepsilon_3 = -1 \end{cases} \end{cases}$$

This condition (54) can be spelled out according to the cases:

$$(55) \qquad \begin{cases} a) & \text{if } \varepsilon_3 = 1, \text{ then } \varepsilon = 1 \text{ and (54) always satisfied} \\ b) & \text{if } \varepsilon_3 = -1, \text{ then (54) reads} \quad \sigma(a') \equiv \varepsilon'_3.a' \quad (\widehat{\Pi}_0) \quad \text{i.e.} \\ & [\dot{\sigma}, \dot{a}'] = \dot{\varepsilon}'_3 \end{cases}$$

m1262

Marginal note. m1262 where the $\cdot$ denote the classes in $M/\widehat{\Pi}_0$

Since we have

$$a' \equiv \varepsilon'_3(\sigma)^{-1}u' = \begin{cases} u' & \text{if } \varepsilon'_3 = 1 \\ \sigma^{-1}u' & \text{if } \varepsilon'_3 = -1 \end{cases},$$

we find that condition (55, b) is also equivalent to:

$$(56) \qquad \begin{cases} \dot{\sigma}(\dot{u}') = \dot{\varepsilon}'_3|\varepsilon'_3\dot{u}' \quad \text{in } M/\widehat{\Pi}_0, \quad \text{i.e.} \\ [\dot{\sigma}, \dot{u}'] = \dot{\varepsilon}'_3|\varepsilon'_3 \end{cases}$$

(equivalence[i1] Valid both for $\varepsilon'_3 = 1$ and $\varepsilon'_3 = -1$).

Now we have seen (35) that we have in $\widehat{G}/\widehat{\Pi}_0$)

$$\dot{u}'(\dot{\sigma}) = \varepsilon_2(u')\dot{\sigma}$$

i.e.

$$[\dot{u}', \dot{\sigma}] = \varepsilon_2(u') \quad \text{or again}$$

$$(57) \qquad [\dot{\sigma}, \dot{u}'] = \varepsilon_2(\dot{u}'|\hat{u}')^{\cdot}.$$

Comparing (56) and (57), we see that (56) takes the equivalent form

$$(58) \qquad \varepsilon_2(u') = \varepsilon_3(u').$$

We have thus proved:

Proposition. Let u, u', and $u'' = u'u \in M^!{}[0] = Z^!_{\rho,\sigma}$, corresponding to $\varepsilon_3, | \neq \varepsilon'_3$, $\varepsilon''_3 = \varepsilon'_3\varepsilon_3 \in \{\pm 1\}$, and:

$$a = \varepsilon_3(\tau')\alpha^{-1}u, \quad a' = \varepsilon'_3(\tau')\alpha'^{-1}u', \quad a'' = \underbrace{\varepsilon''_3(\tau')}_{\varepsilon'_3(\tau')\varepsilon_3(\tau')}\ \alpha''^{-1}\ \underbrace{u''}_{u'u},$$

with $a, a', a'' \in N'_\rho|N^*_\rho$, $a \equiv \varepsilon_3(\sigma)^{-1}u$, $a' \equiv ...$, $a'' \equiv ...$ (Π_0)[i4] [d3] The following conditions are equivalent:

m1263

Marginal note. [m1263] N.B. $\begin{cases} \varepsilon_3 = \varepsilon_3(u) = \varepsilon_3(a) \\ \varepsilon'_3 = \varepsilon_3(u') = \varepsilon_3(a') \\ \varepsilon''_3 = \varepsilon_3(u'') = \varepsilon_3(a''|a') \end{cases}$

[p. 599]

Remark The elements of the inverse image|image $S_0\Gamma^{'!|!'}_{\rho,\sigma}$ of $Z^{!'}_{\rho,\sigma}$ in $S_0\Gamma^{!}_{\rho,\sigma}$ which belong to the section under consideration are characterized (by virtue of the proposition on page 598) by the relation

$$u \equiv b \equiv a \mod \widehat{\Pi}_0 \tag{61}$$

m1265

Marginal note. m1265 (in addition to $\varepsilon_3(u) = 1$ which characterizes the elements of $S_0\Gamma'_{\rho,\sigma}$)

which makes it evident that this is a subgroup. I have not found a nice analogous expression for the membership of an element of $S_0\Gamma^{!''}_{\rho,\sigma}$ (characterized by the relation $\varepsilon_2(u)\varepsilon_3(u) = 1$) in the corresponding section.

Proposition Let $S_0^{\Pi}\Gamma^{!}_{\rho,\sigma} \subset S_0\Gamma^{!}_{\rho,\sigma}$ be the subset of $S_0\Gamma^{!}_{\rho,\sigma}$ d1

$$S_0^{\Pi}\Gamma^{!}_{\rho,\sigma} \subset S_0\Gamma^{!}_{\rho,\sigma}$$
$$''$$

$$\left\{ (u,a,b) \in \begin{array}{c} Z_{\rho,\sigma} \times N^*_\rho \times N^*_\sigma \\ M[0] \end{array} \;\middle|\; \begin{array}{ll} u \equiv b & (\widehat{\Pi}_0) \\ u \equiv \varepsilon_3(\sigma) a & \mod \widehat{\Pi} = \widehat{\Pi}_0 \times \{\pm 1\} \end{array} \right\} \tag{62}$$

Then

a) $S_0^{\Pi}\Gamma^{!}_{\rho,\sigma}$ is a subgroup of $S_0\Gamma^{!}_{\rho,\sigma}$

b) The hom[omorphism] d4

$$S_0^{\Pi}\Gamma^{!}_{\rho,\sigma} \longrightarrow Z^{!}_{\rho,\sigma} = M^{!}[0],$$

$$(u,a,b) \longmapsto u$$

is surjective, and its kernel is the subgroup, isomorphic to $\mu = \{\pm 1\}$, of elements $(1, \varepsilon, 1)$ with $\varepsilon \in \mu = N'_\rho \cap \widehat{\Pi} = L_\rho \cap \widehat{\Pi}$ [p. 590]

[scan 592]

Proof The fact that we have a subgroup follows from the calculation already made on pages $597', 598$, the condition that the product of two elements $(u', a', b')(u, a, b)$ of $S_0^{\Pi}\Gamma_{\rho,\sigma}$ lie in it still being expressed by the formula

$$[\dot\sigma, \dot u'] = \dot\varepsilon_3' \qquad \text{in} \quad M/\widehat\Pi \quad \text{(instead of } M/\widehat\Pi_0) \tag{56}$$

d1or again i1

$$[\dot u', \dot\sigma] = \dot\varepsilon_3' \qquad \text{i.e.} \quad \dot\varepsilon_3' = \dot\varepsilon_2'$$
$$\text{"}$$
$$\dot u'(\dot\sigma)\dot\sigma^{-1} = \dot\varepsilon_2' \tag{56 bis}$$

Now in $\widetilde{\mathcal{G}}|\widetilde{\mathcal{C}}/\Pi_0$, the images of ε_2' and ε_3' both belong to the central subgroup Π/Π_0, hence they are trivial in $\widetilde{\mathcal{G}}|\widetilde{\mathcal{C}}/\Pi$, hence relation (56 bis) is trivially|trivially satisfied.

The surjectivity of the map $S_0^{\Pi}\Gamma^!_{\rho,\sigma} \longrightarrow Z^!_{\rho,\sigma}$ comes from the fact that $S_0^{\Pi}\Gamma^!_{\rho,\sigma}$ contains the set-theoretic section $A(Z^!_{\rho,\sigma})$ of the proposition on page 597. The kernel consists of the d2 $(1, a, b)$ with $a \in N^*_\rho \cap \Pi$, $b \in N^*_\sigma \cap \Pi_0$.

Now $N^*_\rho \cap \widetilde{\mathcal{G}}|\widetilde{\mathcal{C}} = L_\rho$, $N^*_\sigma \cap \widetilde{\mathcal{G}}|\widetilde{\mathcal{C}} = L_\sigma$, and

$$L_\rho \cap \widehat\Pi = L_\sigma \cap \widehat\Pi = \mu, \qquad L_\rho \cap \widehat\Pi_0 = L_\sigma \cap \widehat\Pi_0 = \{1\} \tag{57}$$

[p. 600]

whence the characterization of the kernel.

Corollary Let us consider d1 $S_0\Gamma^!_{\rho,\sigma}$ as an extension of $Z^!_{\rho,\sigma} = M^!{}[0]$ by

$$L_\rho \times L_\sigma \simeq \mathbb{Z}/6\mathbb{Z} \times \mathbb{Z}/4\mathbb{Z}, \qquad \text{hence}$$

(writing $L_\rho \simeq \mu \times L_{-\rho} \simeq \mathbb{Z}/3\mathbb{Z} \times \mathbb{Z}/2\mathbb{Z}$) an extension of

$$\underbrace{\mathbb{Z}/2\mathbb{Z}}_{\mu} \times \underbrace{\mathbb{Z}/3\mathbb{Z}}_{L_{-\rho}} \times \underbrace{\mathbb{Z}/4\mathbb{Z}}_{L_\sigma}.$$

d4

This extension corresponds therefore canonically|canonically to three extensions, by $\mu, L_{-\rho}, L_\sigma$ respectively. The|The extensions|extension[i2d5] by $L_{-\rho} \times L_\sigma$ [d6] equipped two|with a canonical sections.

There remains an extension (this is precisely $S_0^{\Pi}\Gamma^!_{\rho,\sigma}$) of $Z^!_{\rho,\sigma}$ by μ.

This extension corresponds just to the ambiguity of the sign in choosing an $\alpha = \widehat{\Pi}$ over $\tilde{\alpha} \in \widehat{\Pi}/\pm 1$ defined by $u \in Z^!_{\rho,\sigma} = M^![0]$, which is reflected in the ambiguity in choosing the sign for $a \in N'_\rho|N^*_\rho$, linked to α by (51)

$$a = \varepsilon_3(\tau')\alpha^{-1}u, \qquad \alpha = ua^{-1}\varepsilon_3(\tau'), \tag{58}$$

We were able to remove this ambiguity by the requirement $\alpha \in \widehat{\Pi}_{0\tau|0,\tau} = \{1, \tau\}.\widehat{\Pi}_0$, and we

[scan 594]

have just observed that this choice, canonical though it is, is not multiplicative. At the same time, we find the complete explicitation of the α'' (normalized canonically|canonically by the condition $\alpha'' \in \widehat{\Pi}_{0\tau}$) associated with $u'' = u'u$, in terms of α' (associated with u') and α (associated with u) also normalized, in terms of a', a[i1] Indeed, the proposition on page 598 tells us in which cases [d1] we have

$$a'' = a'a \tag{59}$$

namely iff we have

$$\varepsilon_3(u) = 1 \quad \text{or} \quad \varepsilon_2(u')\varepsilon_3(u') = 1. \tag{59 bis}$$

But we now know that in any case we must have

$$a'' = \varepsilon a' a \qquad \varepsilon \in \{\pm 1\} \tag{60}$$

and we now find that $\varepsilon = +1$ iff we are in case (59 bis), -1 in the contrary case i.e. if $\varepsilon_3(u) = -1$ and $\varepsilon_2(u')\varepsilon_3(u') = +1$. In summary

Corollary Let $u, u' \in M^!{}[0]$, whence $u'' = u'u$, let $\alpha, \alpha', \alpha'' \in \widehat{\Pi}_{0\tau}$ be associated (defined by $u(\rho) = \mathrm{int}(\alpha)\rho$ etc) and put

[p. 601]

$$a = \varepsilon_3(\tau')\alpha^{-1}u, \qquad a' = \varepsilon'_3(\tau')\alpha'^{-1}u', \qquad a'' = \varepsilon''_3(\tau')\alpha''^{-1}u'' \tag{61}$$

where

$$\varepsilon_3(\tau') = \begin{cases} 1 & \text{if } \varepsilon_3 = 1 \\ \tau' & \text{if } \varepsilon_3 = -1 \end{cases} \qquad \text{and the } \overline{\mathrm{m}} \text{ for } \varepsilon'_3(\tau'),\ \varepsilon''_3(\tau'),$$

and where $\varepsilon_3 = \varepsilon_3(u) = \varepsilon_3(\chi|\gamma(u))$, and likewise for $\varepsilon'_3, \varepsilon''_3$ — hence $\varepsilon''_3 = \varepsilon_3\varepsilon'_3$. We then have

$$a'' = \varepsilon a' a, \quad \text{with} \quad \varepsilon \in \{\pm 1\} \tag{62}$$

and

$$\begin{cases} \varepsilon = +1 & \text{iff} \quad \varepsilon_3 = 1 \text{ or } \varepsilon'_2\varepsilon'_3 = 1 \qquad \text{hence} \\ \varepsilon = -1 & \text{iff} \quad \varepsilon_3 = -1 \text{ and } \varepsilon'_2\varepsilon'_3 = -1. \end{cases} \tag{63}$$

therefore

We will have|have therefore [d2]

$$\begin{cases} \alpha'' = u''a''^{-1}\varepsilon''_3(\tau') \\ \qquad = \varepsilon u' u\, a^{-1}\, \underbrace{a'^{-1}\varepsilon_3^{\dagger|''}(\tau')}\, \varepsilon'_3(\tau') \end{cases} \tag{*}$$

I [d4] presume[i2] that we will have

$$\alpha'' = \varepsilon u'(\alpha)\alpha' \qquad \text{where } \varepsilon \text{ given by (63).} \tag{64}$$

not true in general

Indeed

$$\begin{cases} \alpha = u\, a^{-1}\varepsilon_3(\tau') \\ \alpha' = u'\, a'^{-1}\varepsilon'_3(\tau') \end{cases} \qquad \text{whence}$$

$$u'(\alpha) = u'u\,a^{-1}\varepsilon_3(\tau')u'^{-1}$$
$$u'(\alpha)\alpha' = u'u\,a^{-1}\underbrace{\varepsilon_3(\tau')a'^{-1}}\,\varepsilon_3'(\tau')$$

Formula (64), by virtue of (*), thus takes the form

$$a'^{-1}\varepsilon_3(\tau') = \varepsilon_3(\tau')a'^{-1}$$

i.e.

$$[\varepsilon_3(\tau'), a'^{-1}] = 1$$

it is not always satisfied if $\varepsilon_3 = -1$ i.e. $\varepsilon_3(\tau') = \tau'$, where it represents again[i3] a draconian restriction on a'. The formula that is always correct is [d8]

$$\alpha'' = (\varepsilon u'(\alpha)\alpha')\,.\,\underbrace{\varepsilon_3'(\tau')([a', \varepsilon_3(\tau')])}_{[\varepsilon_3'(\tau')(a'),\,\varepsilon_3(\tau')]}$$

$$\alpha'' = (\varepsilon u'(\alpha)\alpha') \cdot \begin{bmatrix} \\ \underbrace{\alpha'^{-1}u'}_{\text{"}}, \ \varepsilon_3(\tau') \\ \varepsilon_3'(\tau')a' \\ \cap \end{bmatrix} . \tag{65}$$

(where $\varepsilon \in \{\pm 1\}$ defined in|definition (63))

It|I remains to examine the question whether the extension d2 $S_0^{\Pi}\Gamma_{\rho,\sigma}$ of $Z^!_{\rho,\sigma} \simeq M^![0]$ by $\mu = \{\pm 1\}$ is trivial or not, taking into account the fact that its restrictions to $Z^{!'}_{\rho,\sigma}$ and to $Z^{!''''}_{\rho,\sigma}$ are trivial.

Let $S_0^{\Pi}\Gamma^{!'}_{\rho,\sigma}$, $S_0^{\Pi}\Gamma|W^{!''''}_{\rho,\sigma})|]$ be the inverse images of $Z^{!'}_{\rho,\sigma}$, $Z^{!''''}_{\rho,\sigma}$ in $S_0^{\Pi}\Gamma^!_{\rho,\sigma}$, hence

$$\begin{cases} S_0^{\Pi}|\Sigma^{\Pi}_{\rho k}\Gamma^{!'}_{\rho,\sigma} = S_0^{\Pi}\Gamma^!_{\rho,\sigma} \cap \Gamma^{!'}_{\rho,\sigma} \\ S_0^{\Pi}\Gamma^{!''''}_{\rho,\sigma} = S_0^{\Pi}\Gamma^!_{\rho,\sigma} \cap \Gamma^{!''''}_{\rho,\sigma} \end{cases} \tag{66}$$

and we have exact sequences of central extensions

$$\begin{cases} 1 \longrightarrow \mu \longrightarrow S_0^{\Pi}\Gamma^{!'}_{\rho,\sigma} \longrightarrow Z^{!'}_{\rho,\sigma} \longrightarrow 1 \\ \\ 1 \longrightarrow \mu \longrightarrow S_0^{\Pi}\Gamma^{!''''}_{\rho,\sigma} \longrightarrow Z^{!''''}_{\rho,\sigma} \longrightarrow 1 \end{cases} , \tag{67}$$

which are split by subgroups denoted respectively $S_0^{\Pi_0}\Gamma^{!'}_{\rho,\sigma}$, $S_0^{\Pi_0}\Gamma^{!''|!''''}_{\rho,\sigma}$, so that we have

$$\begin{cases} S_0^{\Pi}\Gamma^{!'}_{\rho,\sigma} \simeq S_0^{\Pi_0}\Gamma^{!'}_{\rho,\sigma} \times \mu \\ S_0^{\Pi}\Gamma^{!''''}_{\rho,\sigma} \simeq S_0^{\Pi_0}\Gamma^{!''''}_{\rho,\sigma} \times \mu. \end{cases} \tag{68}$$

[p. 602]

I ask myself whether these subgroups

$$\begin{cases} S_0^{\Pi_0}\Gamma^{!'}_{\rho,\sigma} \subset S_0^{\Pi}\Gamma^{!'}_{\rho,\sigma} \subset S_0^{\Pi}\Gamma^!_{\rho,\sigma} \\ S_0^{\Pi_0}\Gamma^{!''''}_{\rho,\sigma} \subset S_0^{\Pi}\Gamma^{!''''}_{\rho,\sigma} \subset S_0^{\Pi}\Gamma^!_{\rho,\sigma} \end{cases} \tag{69}$$

m1269

Marginal note. m1269 Subgroups of indices|of index 4 in $S_0^{\Pi}\Gamma_{\rho,\sigma}$

are invariant in $S_0^{\Pi}\Gamma^!_{\rho,\sigma}$, which would also mean (passing then to the quotient by these subgroups) that the extension $S_0^{\Pi}\Gamma^!_{\rho,\sigma}$ of $Z^!_{\rho,\sigma}$ by μ, split over $Z^{!'}_{\rho,\sigma}$ and over $Z^{!'''}_{\rho,\sigma}$, in fact comes (with the said splittings) from extensions of $Z^!_{\rho,\sigma}/Z^{!'}_{\rho,\sigma}$ ($\simeq \pm 1$) and of $Z^!_{\rho,\sigma}/Z^{!'''}_{\rho,\sigma}$ ($\simeq \pm 1$) by μ, which would then have to be characterized (as trivial or nontrivial).

Since the subgroups in question are normal in $S_0^{\Pi}\Gamma^{!'}$ resp. $S_0^{\Pi}\Gamma^{!'''}$, d1 if x is an element of $S_0^{\Pi}\Gamma^!$ which is not in $S_0^{\Pi}\Gamma^{!'}$ resp. $S_0^{\Pi}\Gamma^{!'''}$, to say that $S_0^{\Pi_0}\Gamma^{!'}$ (resp. $S_0^{\Pi_0}\Gamma^{!'''}$) is normal in $S_0^{\Pi}\Gamma^!$ as a whole simply means that it is normalized by x.

1°) Case of $S_0^{\Pi_0}\Gamma^{!'}$ in $S_0^{\Pi}\Gamma^!$. We shall take $\underline{x} = (u_0, a_0, b_0)$ with $u_0 = \tau$, hence $\varepsilon_3(u_0) = \varepsilon_2(u_0) = \chi(u_0) = -1$,i1 d3

$$(70)\qquad \begin{cases} \alpha_0 = \tau, \quad \beta_0 = 1, \quad a_0 = \varepsilon^0_{3,0}(\tau')\alpha_0^{-1}u_0 = \tau', \quad b_0 = \beta_0^{-1}u_0 = \tau) \\ \text{thus} \qquad \underline{x} = (u_0 = \tau,\ a_0 = \tau',\ b_0 = \tau) \end{cases}$$

thus we have

$$x \in S_0^{\Pi_0}\Gamma^{!'''} \underset{2}{\subset} S_0^{\Pi}\Gamma^! \quad \text{and} \quad x \notin S_0^{\Pi}\Gamma^{!'}$$

and we must see whether x normalizes $S_0^{\Pi_0}\Gamma^{!'}$.

Let d2

$$(71)\qquad \underline{u} = \begin{pmatrix} u, & a, & b \\ \cup & \cup & \cup \\ Z & N'_\rho & N'_\sigma \end{pmatrix} \in S_0^{\Pi_0}\Gamma^{!'} \quad \text{i.e.} \quad \begin{cases} u \equiv a \equiv b \quad (\Pi_0) \\ \varepsilon_3(u) = 1 \end{cases}$$

and let us compute

$$\underline{x}\,\underline{u}\,\underline{x}^{-1} = \underline{x}\,\underline{u}\,x = (\tau(u), \tau'(a), \tau(b))$$

is it in $S_0^{\Pi_0}\Gamma'$ (it is [illeg. 1] only|certainly in $S_0^{\Pi}\Gamma'$) i.e. do we have

$$(72)\qquad \tau(u) \equiv \tau'(a) \equiv \tau(b) \quad (\Pi_0) \qquad ?$$

The relation $\tau(u) \equiv \tau(b) \equiv \tau(a)$ is an immediate consequence of (71), so (72) is equivalent to

$$\tau'(a) \equiv \tau(a) \quad (\Pi_0) \qquad (\text{i.e. } \sigma^{-1}(\tau(a)) = \tau(a)$$

i.e.

$$(73) \qquad — \qquad [\dot{\sigma}, \tau(a)^{\cdot}] = 1 \quad \text{in } \widetilde{\mathcal{G}}^*/\Pi_0$$

Or again, [d6], by virtue of (35 bis) [d7] N.B.

$$\varepsilon_2(\tau(a)) = 1 \qquad \text{i.e.} \quad \varepsilon_2(a) = 1$$

or finally (since $a \equiv u\ (\Pi_0)$)

$$(74) \qquad \varepsilon_2(u) = 1\,.$$

This condition is not a consequence of the condition $\varepsilon_3(u) = 1$, which shows that $S_0^{\Pi_0}\Gamma^{!\prime}$ is not invariant in $S_0^{\Pi}\Gamma^{!}$.

Is $S_0^{\Pi_0}\Gamma^{!\prime\prime\prime}$ invariant in $S_0^{\Pi}\Gamma^{!}$?

Let [d8]

$$(75) \qquad x = (u_0, a_0, b_0) \in S_0^{\Pi_0}\Gamma^{!\prime} \setminus S_0^{\Pi}\Gamma^{!\prime\prime\prime} \quad \text{thus} \quad \text{a)} \quad \begin{cases} \varepsilon_3(u_0) = 1 \\ \varepsilon_2(u_0) = -1 \end{cases}$$

$$\text{b)} \quad u_0 \equiv b_0 \equiv a_0 \quad (\Pi_0)$$

[scan 599]

[p. 603]

and let us study its action on

$$(76) \qquad \underline{u} = (u, a, b) \in S_0^{\Pi_0}\Gamma^{!'''} \qquad \begin{cases} \text{a)} & \underbrace{\varepsilon_2(u)}_{\varepsilon_2}\,\underbrace{\varepsilon_3(u)}_{\varepsilon_3} = 1 \\ \text{b)} & u \equiv b \equiv \varepsilon_3(\sigma)a \quad (\widehat{\Pi}_0) \end{cases}$$

We have

$$(77) \qquad \underline{x}\,\underline{u}\,\underline{x}^{-1} = (u_0(u), a_0(a), b_0(b))$$

and the relation $\underline{x}\,\underline{u}\,\underline{x}^{-1} \in S_0^{\Pi_0}\Gamma^{!'''}$ is written

$$(78) \qquad u_0(u) \equiv b_0(b) \equiv \varepsilon_3'(\sigma)\,.\,a_0(a)\,.$$

Now the relations (75) b) and 76 b) immediately imply

N.B. $\varepsilon_3(u_0(u)) = \varepsilon_3(u)$

$$u_0(u) \equiv b_0(b) \equiv \underbrace{a_0(\varepsilon_3(\sigma)\,.\,a)}_{\varepsilon_3[a_0(\sigma)].a_0(a)}$$

thus the relation (78) is also equivalent to

$$(79) \qquad \varepsilon_3[\sigma] \equiv \varepsilon_3[a_0(\sigma)]$$

which is automatically satisfied if $\varepsilon_3 = 1$, and for $\varepsilon_3 = -1$ amounts to

$$(80) \qquad \sigma \equiv a_0(\sigma) \quad (\widehat{\Pi}_0)$$

$$\text{i.e.} \quad \varepsilon_2(a_0) = 1 \qquad \text{i.e.} \quad \varepsilon_2(u_0) = 1,$$

a relation which is false by hypothesis 75 a).

Thus we again find $S_0^{\Pi_0}\Gamma^{!'''}$ non-invariant in $S_0^{\Pi}\Gamma^{!}$. On the other hand, [d1]let us set[i3 d2]

$$(81) \qquad \begin{cases} S_0\Gamma^0 = \mathrm{Ker}(S_0\Gamma^0 \xrightarrow{(\varepsilon_2,\varepsilon_3)} \mu \times \mu) = S_0\Gamma^{!'} \cap S_0\Gamma^{!'''} \\ \qquad\qquad\qquad\qquad\qquad\qquad = S_0\Gamma^{!'} \cap S_0\Gamma^{!''} \\ \qquad\qquad\qquad\qquad\qquad\qquad = S_0\Gamma^{!''} \cap S_0\Gamma^{!'''} \\ S_0^{\Pi}\Gamma^0 = S_0\Gamma^{!0} \cap S_0^{\Pi}\Gamma^{!}, \\ S_0^{\Pi_0}\Gamma^0 = S_0\Gamma^{!0} \cap S_0^{\Pi_0}\Gamma^{!}, \end{cases}$$

so that we have an exact sequence

$$(82) \qquad 1 \longrightarrow \mu \longrightarrow S_0^{\Pi|\Pi_0}\Gamma^{!0} \longrightarrow S_0\Gamma^{!0} \longrightarrow 1\ ,$$

canonically split by $S_0^{\Pi_0}\Gamma_0$ — we therefore find

$$(82) \qquad S_0^{\Pi}\Gamma^{!0} = S_0^{\Pi_0}\Gamma^{!0} \times \mu\,.$$

This being so, the preceding calculations show that $S_0^{\Pi_0}\Gamma^{!0}$, which is of index 8 in $S_0^{\Pi}\Gamma^{!}$, is an invariant subgroup. In summary:

Proposition Consider the subgroups (of indices 4, 4, 8)[i1] [d1] $S_0^{\Pi_0}\Gamma^{!\prime}$, $S_0^{\Pi_0}\Gamma^{!\prime\prime\prime}$, $S_0^{\Pi_0}\Gamma^{!0}$ of $S_0^{\Pi}\Gamma^{!}$ which are the images of the|of their homomorphic[i2] restrictions $Z^{!\prime}, Z^{!\prime\prime\prime}, Z^{!0}$ of the set-theoretic section: A defined by (51) (52) of $S_0^{\Pi}\Gamma^{!}$ over $Z = M[0]$ — which is multiplicative on these subgroups, and therefore defines splittings of the inverse images $S_0^{\Pi}\Gamma^{\prime|!\prime}, S_0^{\Pi}\Gamma^{\prime\prime\prime|!\prime\prime\prime}, S_0^{\Pi}\Gamma^{0|!0}$ of [d2] $Z^{!\prime}, Z^{!\prime\prime\prime}, Z^{!0}$ in $S_0^{\Pi}\Gamma^{!}$:

$$(83) \qquad S_0^{\Pi}\Gamma^{!\prime} \simeq S_0^{\Pi_0}\Gamma^{!\prime} \times \mu, \qquad S_0^{\Pi}\Gamma^{!\prime\prime\prime} = S_0^{\Pi_0}\Gamma^{!\prime\prime\prime} \times \mu, \qquad S_0^{\Pi}\Gamma^{!0} = S_0^{\Pi_0}\Gamma^{!0} \times \mu.$$

m1273

Marginal note. [m1273]

> Which implies that there is no section [d4](multiplicative)[i3] of the extension $S_0^{\Pi}\Gamma$ of $Z^{!}$ by μ, which coincides with A on $Z^{!\prime}$ or on $Z^{!\prime\prime\prime}$.

We then have this:

a) $S_0^{\Pi_0}\Gamma^{!\prime}, S_0^{\Pi_0}\Gamma^{!\prime\prime\prime}$ are not normal in $S_0^{\Pi}\Gamma^{!}$.

b) $S_0^{\Pi_0}\Gamma^{!0}$ is normal in $S_0^{\Pi}\Gamma^{!}$, so that the extension $S_0^{\Pi}\Gamma^{!}$ of $Z^{!} \simeq M^{!}[0]$ by μ is canonically isomorphic to the inverse image of an extension|category central[i4] and finite $S_0^{\Pi}\Gamma^{!}/(S_0^{\Pi_0}\Gamma^{!0})$ of $Z^{!}/Z^{!0} \simeq \mu \times \mu$ by μ.

[p. 604]

Let us examine this central extension

$$(84)\qquad 1 \longrightarrow \mu \longrightarrow \mathcal{E} \xrightarrow{(\varepsilon_3,\varepsilon_2)} \mu\times\mu \longrightarrow 1$$
$$\wr\Big|$$
$$S_0^{\Pi}\Gamma_{\rho,\sigma}/S_0^{\Pi_0}\Gamma^0_{\rho,\sigma}$$

fitting into the diagram of extensions,

$$(85)\qquad \begin{array}{ccccccccc} 1 & \longrightarrow & \mu & \longrightarrow & \mathcal{E} & \longrightarrow & \mu\times\mu & \longrightarrow & 1 \\ & & \uparrow{\scriptstyle 1} & & \uparrow & & \uparrow{\scriptstyle (\varepsilon_3,\varepsilon_2)} & & \\ 1 & \longrightarrow & \mu & \longrightarrow & S_0^{\Pi}\Gamma^!_{\rho,\sigma} & \longrightarrow & Z^!_{\rho,\sigma} & \simeq M[0] & \\ & & \downarrow & & \downarrow & & \downarrow{\scriptstyle 1} & & \\ 1 & \longrightarrow & L_\rho\times L_\sigma & \longrightarrow & S_0\Gamma^!_{\rho,\sigma} & \longrightarrow & Z^!_{\rho,\sigma} & \longrightarrow & 1 \end{array}$$

The interest of (84) is that it allows one to recover the extension $S_0\Gamma_{\rho,\sigma}$ of $Z^!_{\rho,\sigma}$ by $L_\rho\times L_\sigma$, by the covariant-contravariant law in the functor "extensions", from

$$(86)\qquad Z^!_{\rho,\sigma} \xrightarrow{(\varepsilon_3,\varepsilon_2)} \mu\times\mu\ , \qquad \begin{array}{ccc} \mu & \hookrightarrow & L_\rho\times L_\sigma \\ -1 & \longmapsto & (\rho^3,\sigma^2) \end{array}\ ,$$

("diagonal homomorphism")

as well as the subextension $S_0^{\Pi}\Gamma^!_{\rho,\sigma}$ of the latter (of $Z^!_{\rho,\sigma}$ by μ).

Let us first study the order of the elements of $\mathcal{E}$ — they are obviously divisors of 4, are they all of order 2 (or 1)? Let

$$\underline{\bar{u}|u} = \begin{pmatrix} u, & a, & b \\ \cup & \cup & \cup \\ Z & N^*_\rho & N^*_\sigma \end{pmatrix} \in S_0^{\Pi}\Gamma^! \qquad \text{i.e.} \quad \begin{cases} u \equiv b & (\widehat{\Pi}_0) \\ u \equiv \varepsilon_3[\sigma]a & (\widehat{\Pi}) \end{cases} \tag{87}$$

m1274

Marginal note. m1274 N.B. To prevent|introduce confusions, I write $\varepsilon_3[\sigma], \varepsilon_3[\tau']$ in preference to|of $\varepsilon_3(\sigma), \varepsilon_3(\tau')$ for $\sigma^{\nu_3}, \tau'^{\nu_3}$.

I d1 want to examine whether $\underline{u}^2 \in S_0^{\Pi_0}\Gamma^{!0}$. Obviously

$$\underline{u} = (u^2, a^2, b^2) \in S_0^{\Pi}\Gamma^{!0}$$

[p. 600]

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 602]

it remains to see whether $\underline{u}^2 \in S_0^{\Pi_0}\Gamma^!$, i.e. whether we have d1 only $u^2 \equiv b^2$ (Π_0) and $u^2 \equiv a^2$ $(\widehat{\Pi})$ — which is clear and simply expresses $\underline{u}^2 \in S_0^{\Pi}\Gamma|\Gamma^!$ — but even

$$u^2 \equiv a^2 \mod \underline{\underline{\widehat{\Pi}_0}} \qquad (?) \tag{88}$$

The relation

$$u \equiv \varepsilon_3[\sigma].a \mod \Pi$$

can also be written

$$u \equiv \pm\varepsilon_3[\sigma].a \mod \Pi_0$$

and implies

$$u^2 \equiv \varepsilon_3[\sigma]a\ \varepsilon_3[\sigma]a \mod \Pi_0$$

which we can write

$$u^2 \underset{\text{mod } \widehat{\Pi}_0}{\equiv} \varepsilon_3\,\varepsilon_3[\sigma](a).a = \begin{cases} a^2 & \text{if } \varepsilon_3 = 1. \\ -\sigma(a).a & \text{if } \varepsilon_3 = -1 \end{cases} \tag{89}$$

Thus (88) is true if $\varepsilon_3 = 1$, whereas for $\varepsilon_3 = -1$, it is equivalent to

$$\sigma(a) \equiv -a \qquad (\widehat{\Pi}_0)$$

i.e.

$$[\sigma, a]^{\cdot} = -1 \quad \text{in } \widetilde{\mathcal{G}}|\widetilde{\mathcal{C}}/\Pi_0$$

i.e.

$$\underbrace{\varepsilon_2(a)}_{\| \ \varepsilon_2(u)} = -1 \qquad \text{i.e. } \varepsilon_2(u)\varepsilon_3(u) = 1.$$

Thus we find:

Proposition Let $x \in \mathcal{E}$ (cf. (84)). For $x^2 = 1$ to hold, it is necessary and sufficient that we have $\varepsilon_3(x) = 1$ or $\varepsilon_2(x)\varepsilon_3(x) = 1$, i.e. that [d3] we have[i2]

$$x \in \mathcal{E}' \cup \mathcal{E}''', \tag{90}$$

[p. 605]

where

$$\mathcal{E}' = \{x|n \in \mathcal{E} \mid \varepsilon_3(x) = 1\}, \qquad \mathcal{E}''' = \{x|n \in \mathcal{E} \mid \varepsilon_2(x)\varepsilon_3(x) = 1\} \tag{91}$$

Corollary 1 $\mathcal{E}$ has exactly two elements of order 4, which are the two elements of $\mathcal{E}$ above the element $(-1, 1)$ of $\mu \times \mu$. These two elements are inverses of one another, these|and are the two generators of the only cyclic subgroup of order 4 of $\mathcal{E}$, which is none other than

$$\mathcal{E}'' = \{x|n \in \mathcal{E} \mid \varepsilon_2(x) = 1\} \tag{92}$$

Corollary 2 The extension $\mathcal{E}$ is not split.

For being central, it [d1] would be isomorphic to $(\mu \times \mu) \times \mu$, so its elements would have order dividing 2.

We can now regard $\mathcal{E}$ as an extension of $\mathcal{E}/\mathcal{E}'' \simeq \{\pm 1\} = \mu$ by $\mathcal{E}''$ ($\simeq \mathbb{Z}/4\mathbb{Z}$). [d2] It would be necessary first to make explicit the operation of $\mathcal{E}/\mathcal{E}'' = \mu$ on $\mathcal{E}'|\mathcal{E}''$ — the element -1[i1] of order 2 of μ induces an involutive automorphism of [d3] $\mathcal{E}''$ moreover in $\mathrm{Aut}(\mathcal{E}'|\mathcal{E}'') \simeq (\mathbb{Z}/4\mathbb{Z})^* \simeq \{\pm 1\}$, so the automorphism in question[i2] [d4] is multiplication by a sign $\varepsilon \ \pm 1$, which has to be determined. We are going to take as representative of $-1 \in \mathcal{E}/\mathcal{E}''$[i3] the element of $\mathcal{E}$ coming [d5]from[i4]

$$\underline{x} = (u_0 = \tau, \ a_0 = \tau', \ b_0 = \tau) \in S_0^{\Pi_0}\Gamma^{!'''} \qquad \text{(cf.(70))} \tag{92}$$

which we are going to have operate on the image of a

$$\underline{u} = (u, a, b) \in S_0^{\Pi}\Gamma^!, \qquad \text{with } \varepsilon_3(u) = -1,\ \varepsilon_2(u) = 1 \tag{93}$$

$$\begin{pmatrix} u \equiv b & \mathrm{mod}\widehat{\Pi}_0 \\ u \equiv \sigma a & \mathrm{mod}\widehat{\Pi} \end{pmatrix}$$

[i5] (which is a generator of $\mathcal{E}''$).

[scan 604]

We shall thus have

$$\underline{x}(\underline{u}) = (\tau(u), \tau'(a), \tau(b)) \equiv \underbrace{(1, \varepsilon, \varepsilon)(u, a, b)}_{(u, \varepsilon a, \varepsilon b)}$$

modulo $S_0^{\Pi_0}\Gamma^{!0|0}$, with a sign $\varepsilon \in \{\pm 1\}$ to be determined. The congruence condition can be written

$$(u\tau(u)^{-1},\ \varepsilon a\tau'(a)^{-1},\ \varepsilon b\tau'(b)|\tau(b)^{-1}) \in S_0^{\Pi_0}\Gamma^{!0|0}$$

that we are in $S_0^{\Pi}\Gamma^{!0}$ is obvious, [d2] [d3] valid|valid[i3] whatever the choice of the sign ε, [d4] [d5]it is[i4] the|the condition|conditions of congruence [d6] [d7] which distinguishes|distinguish $S_0^{\Pi_0}\Gamma^!$ from $S_0^{\Pi}\Gamma^!$ which is[i5] essential, namely

$$u\tau(u)^{-1} \equiv \varepsilon a\tau'(a)^{-1} \qquad (\widehat{\Pi}_0) \qquad \text{i.e.} \tag{94}$$

[d8]

The difficulty with this approach comes from the fact that the only elements of M that we know how to make explicit are those coming from $\widetilde{\mathcal{G}}|\widetilde{\mathcal{C}} \simeq \mathrm{Gl}(2, \mathbb{Z})$ itself; now for these we have $\varepsilon_2(u)\varepsilon_3(u) = 1$, whereas the u-here[i6] [d9] above must satisfy $\varepsilon_2(u) = 1$, $\varepsilon_3(u) = -1$ so $\varepsilon_2(u)\varepsilon_3(u) = -1$. We can on the other hand work in the [d10] quotient[i7] $\mathrm{Gl}(2, \widehat{\mathbb{Z}})$ of [d11] M, and take in it

$$u = \begin{pmatrix} \mu & 0 \\ 0 & 1 \end{pmatrix} \quad \text{with} \quad \mu \in \widehat{\mathbb{Z}}^*, \quad \begin{cases} \mu \equiv -1 & (3) \\ \mu \equiv 1 & (4) \end{cases} \tag{95}$$

$$\text{i.e.} \quad \mu \equiv 5 \quad (12)$$

[i8] whereas τ corresponds to the matrix

$$\tau = \begin{pmatrix} -1 & 0 \\ 0 & 1 \end{pmatrix}$$

[p. 606]

we shall in any case have

$$u\tau(u)^{-1} = 1$$

let, on the other hand, in $\mathrm{Gl}(2, \widehat{\mathbb{Z}})$

$$\begin{cases} a = \tau' a_0 & a_0 = c\rho + d \qquad c^2 + cd + d^2 \in \widehat{\mathbb{Z}}^* \\ & \tau' = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}, \quad \rho = \begin{pmatrix} 0 & 1 \\ -1 & 1 \end{pmatrix} \end{cases} \tag{96}$$

thus|whence

$$a = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} d & c \\ -c & c+d \end{pmatrix} = \begin{pmatrix} -c & c+d \\ d & c \end{pmatrix} \tag{97}$$

and

$$\mu = -(c^2 + cd + d^2) \tag{98}$$

We [d1] work with the closed sub-[i1]group $\widehat{\Pi}_0$ in $\mathrm{Sl}(2, \widehat{\mathbb{Z}})$ generated by

a little brief...
cf. below...

$$-\ell_0 = -\begin{pmatrix} 1 & -2 \\ 0 & 1 \end{pmatrix}, \qquad -\ell_1 = -\begin{pmatrix} 1 & 0 \\ 2 & 1 \end{pmatrix}, \qquad -\ell_\infty = -\begin{pmatrix} 3 & -2 \\ 2 & -1 \end{pmatrix}$$

and in the quotient group of $\mathrm{Gl}(2, \widehat{\mathbb{Z}})$ by $\widehat{\Pi}_0$, which is [d3] the extension of $\widehat{\mathbb{Z}}^*$ by

$$\mathrm{Sl}(2, \widehat{\mathbb{Z}})/\widehat{\Pi}_0 \simeq \mathrm{Sl}(2, \mathbb{Z})/\Pi_0 \simeq \left\{ (\rho, \sigma) \;\middle|\; \begin{array}{l} \rho^6 = \sigma^4 = 1 \\ \rho^3 = \sigma^2 \\ \sigma(\rho) = \rho^{-1} \end{array} \right\},$$

[d4] and this|in a $\frac{1}{2}$ direct product thanks to

$$T_0 = \left\{ \begin{pmatrix} \zeta|\xi & 0 \\ 0 & 1 \end{pmatrix} \;\middle|\; \zeta|\xi \in \widehat{\mathbb{Z}}^* \right\} \overset{\det}{\simeq} \widehat{\mathbb{Z}}^*,$$

operating through $\varepsilon_2(\zeta|\xi)$ — cf. pages 593′, 594 — formulas (34)(35)(35 bis)]. We must[i2] suppose

$$\sigma a \equiv u \qquad (\widehat{\Pi}_0) \qquad \text{where } \sigma = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix} \tag{99}$$

thus

$$\sigma a = \begin{pmatrix} -d & -c \\ -c & c+d \end{pmatrix} \tag{100}$$

Scans 606–624

[scan 606]

d1 The relation[i1] (99), d2 is written

$$\begin{cases} \sigma a \equiv u \quad (\mathrm{SL}(2,\widehat{\mathbb{Z}})) \quad \text{i.e.} \quad \det \sigma a = \det u \quad \text{i.e. (98)} \\ \sigma a \equiv u \quad (2) \end{cases} \tag{102}$$

d5 and this last congruence is written

$$\begin{gathered} c \equiv 0 \quad (2) \qquad d \equiv 1 \quad (2) \\ (-d \equiv \mu \quad (2) \text{ is a consequence of it for } \mu \equiv 1 \equiv -1 \quad (2)) \,. \end{gathered} \tag{103}$$

N.B. It is not possible to have the d9 congruences mod 4 ($\sigma a \equiv u$ (4), for we would have $\mu \equiv -d \equiv -1$ (4), which is contrary to the hypothesis (95) $\mu \equiv 1$ (4).

d10

Returning to the relation (99), we find this:

d11 Lemma.[i2] Let $c, d \in \widehat{\mathbb{Z}}$ satisfy

$$\mu \overset{\text{dfn}}{=} -(c^2 + cd + d^2) \in \widehat{\mathbb{Z}}^* \tag{104}$$

m1277

Marginal note. m1277 N.B. We will necessarily have $\mu \equiv -1$ (3)

$$\mu \equiv 1 \quad (4) \qquad (\text{i.e. } c^2 + cd + d^2 \equiv -1 \quad (4)). \tag{105}$$

$$c \equiv 0 \quad (2), \qquad d \equiv 1 \quad (2) \tag{106}$$

Let d13 d[i3]

$$a = \tau'(c\rho + d) = \begin{pmatrix} -c & c+d \\ d & c \end{pmatrix} \in \mathrm{GL}(2,\widehat{\mathbb{Z}}) \tag{107}$$

(matrix with determinant μ). Then we have a congruence

$$a\tau'(a)^{-1} \equiv \varepsilon \qquad \mod \widehat{\Pi}_0 \subset \mathrm{GL}(2,\widehat{\mathbb{Z}}) \tag{108}$$

d14 the sign $\varepsilon \in \{\pm 1\}$ does not depend on the choices made for c, d.

[scan 607]

[p. 607]

Now is the time to calculate it! Taking up again

$$a_0 = c\rho + d \quad \in Z_\rho$$

we will have

$$a = \tau' a_0, \quad \tau'(a) = a_0 \tau', \quad a\tau'(a)^{-1} = \tau' a_0 \tau'^{-1} a_0^{-1} = \tau'(a_0) a_0^{-1}$$

where

$$\begin{cases} \tau'(a_0) = c\rho^{-1} + d = {}^t a_0 \\ a_0^{-1} = {}^t a_0 / \det a_0 = -\dfrac{1}{\mu}(c\rho^{-1} + d) \end{cases}$$

m1278

Marginal note. m1278 We set for $u \in \mathrm{M}_2(\widehat{\mathbb{Z}})$ i1 ${}^t u = (\operatorname{Tr} u) - u$ and we have ${}^t\rho = \rho^{-1}$ (more generally ${}^t u = u^{-1}$ if $\det u = 1$)

thus

$$a\tau'(a)^{-1} = \tau'(a_0)a_0^{-1} = -\frac{1}{\mu}(c\rho^{-1}+d)^2 = \frac{1}{c^2+cd+d^2}(c\rho^{-1}+d)^2$$

Now we have

$$(c\rho^{-1}+d)^2 = c^2 \underbrace{\rho^{-2}}_{-\rho} + 2cd \underbrace{\rho^{-1}}_{1-\rho} + d^2 = -(c^2+2cd)\rho + (2cd+d^2).$$

Now d1

$$c \equiv 0 \quad (2) \Longrightarrow c^2, 2cd \equiv 0 \quad (4)$$
$$d \equiv 1 \quad (2) \Longrightarrow d^2 \equiv 1 \quad (4) \qquad \text{thus}$$

d3

$$(*) \qquad (c\rho^{-1}+d)^2 \equiv 1 \quad (4)$$

d4

d5

And since by hypothesis

$$c^2 + cd + d^2 \equiv -1 \quad (4)$$

we will have

$$a\tau'(a)^{-1} = \frac{1}{c^2+cd+d^2}(c\rho^{-1}+d)^2 \equiv -1 \quad (4) \tag{109}$$

So we have proved, in fact

Proposition Let $c, d \in \mathbb{Z}|\widehat{\mathbb{Z}}$ be such that $\xi \overset{\text{dfn}}{=} c^2 + cd + d^2 \in \widehat{\mathbb{Z}}^*$, let

$$a = \tau'(c\rho + d) = \begin{pmatrix} -c & c+d \\ d & c \end{pmatrix} \in \mathrm{GL}(2, \widehat{\mathbb{Z}}),$$

d6

$$\sigma a \equiv \begin{pmatrix} \xi & 0 \\ 0 & 1 \end{pmatrix} \quad (2) \qquad \text{i.e.}$$

$$c \equiv 0 \quad (2), \qquad d \equiv 1 \quad (2).$$

N.B. $\sigma = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}$

Then we have (for $\tau' = \begin{pmatrix} -1 & 0 \\ 0 & 1 \end{pmatrix}$)

$$a\tau'(a)^{-1} \equiv \varepsilon_2(\xi) \quad (4)$$

(a fortiori we have the congruence mod $\widehat{\Pi}_0$).

Corollary The extension $\mathcal{E}$ of $\mu \times \mu$ by μ (84|89), or of μ by $\mathcal{E}'' \simeq \mathbb{Z}/4\mathbb{Z}$, is noncommutative. |

But here is a way of seeing it without calculation. If the extension were commutative, [d1] its isomorphism class[i1] would be given by an $\mathrm{Ext}_{\mathbb{Z}}$|$\mathrm{Ext}^1_{\mathbb{Z}}$ (or an $\mathrm{Ext}^{1|?}_{\mathbb{Z}/4\mathbb{Z}}$). Now the functor Ext|$\mathrm{Ext}^1(-,\mu)$ is additive. Since the restriction of the extension to the subgroups $\mathcal{E}'/\mu$ and $\mathcal{E}'''/\mu$ of $\mu \times \mu$ is trivial, and $\mu \times \mu$ is the direct sum of these subgroups (which are resp. $1 \times \mu$ and the diagonal subgroup), it would follow that the extension would be trivial, but we have seen that this is not the case.

[d2] The structure of the group $\mathcal{E}$ is readily made explicit, for example in its capacity as an extension of $\mathcal{E}/\mathcal{E}'' \simeq \mu$ by $\mathcal{E}'' \simeq \mathbb{Z}/4\mathbb{Z}$. [d3] Let us choose any element of $\mathcal{E} - \mathcal{E}''$, it is of order 2 (the only elements of order 4 being in $\mathcal{E}''$) so that we have

[p. 608]

$$\mathcal{E} \simeq \{1, x\} \,.\, \mathcal{E}'' \qquad \left(\tfrac{1}{2} \text{ direct}\right) \tag{110}$$

Let us note that if x operated trivially on $\mathcal{E}''$, [d1] if $\mathcal{E}$ were isomorphic to the product, then for an element u of $\mathcal{E}''$[i1] of order 4, $x.u$ would be of order 4|8, which is absurd (third proof of the fact that $\mathcal{E}/\mathcal{E}'' \simeq$[i2] μ operates nontrivially on $\mathcal{E}''$). Now from the mere fact that the operation of $\{1, x\}$ on $\mathcal{E}''$ is nontrivial., it is known, and the structure of[i3] $\mathcal{E}$ is determined – in fact we have

$$\mathcal{E} \simeq \mathbb{D}_4 \tag{111|110}$$

There is a preferred choice of x, by taking for x the element

$$\begin{cases} \tau_{\mathcal{E}} \overset{\text{dfn}}{=} \tau_{S_0\Gamma} \bmod S_0^{\Pi}\Gamma^0, & \text{where of course} \\ \tau_{S_0\Gamma} = (\tau, \tau', \tau), \end{cases} \tag{112}$$

so that we have a canonical representation

$$\mathcal{E} \simeq \{1, \tau_{\mathcal{E}}\} \,.\, \mathcal{E}'' \qquad \text{product } \tfrac{1}{2} \text{ direct} \tag{113}$$

$\mathcal{E}'' \simeq \mathbb{Z}/4\mathbb{Z}$
$\tau_{\mathcal{E}}(u) = u^{-1}$
for $u \in \mathcal{E}''$.

The homomorphism $\mathcal{E} \to \mu \times \mu$ is recovered from its restrictions to the two factors

$$\begin{aligned} &\mu \simeq \{1, \tau_{\mathcal{E}}\} \longrightarrow \mu \times \mu \qquad \tau_{\mathcal{E}} \longmapsto (-1, -1) \quad \text{(diagonal homomorphism)} \\ &\mathcal{E}'' \longrightarrow \mu \times \{1\} \hookrightarrow \mu \times \mu \end{aligned} \tag{114}$$

the unique nontrivial homomorphism $\mathcal{E}'' \to \mu$ deduced from the isomorphism

$$\mathcal{E}''_2 \overset{\text{dfn}}{=} \mathcal{E}''/2\mathcal{E}'' | \mathcal{E}''/{}_2\mathcal{E}'' \xrightarrow{\sim} \mu$$

[scan 610]

The fact that $\mathcal{E}$ is not commutative is also expressed by the fact that the canonical homomorphism

$$\mathcal{E}_{\text{ab}} \xrightarrow{\sim} \mu \times \mu \tag{115}$$

is an isomorphism, i.e. that the kernel subgroup μ of $\mathcal{E}_{\mathrm{ab}}|\mathcal{E} \to \mu \times \mu$ is also the commutator subgroup.

We have seen that the extension $\mathcal{E}$ of $\mu \times \mu$ by μ is not split, but what about its inverse image, the extension $S_0^{\Pi}\Gamma^!$ of $Z^! \simeq \mathcal{M}[0]$ by μ? A priori, we only know that there is no splitting of this extension which extends the canonical splitting A we have over

$$Z^0 = \mathrm{Ker}\left(Z^! \xrightarrow{(\varepsilon_3, \varepsilon_2)} \mu \times \mu \right).$$

I presume that even $S_0^{\Pi}\Gamma''$, an extension of $Z^{!\prime\prime}$ by μ, is nontrivial, and even the extension it induces on the subgroup

$$\Gamma'_{\mathbb{Q}} = \Gamma_{\mathbb{Q}} \cap \underbrace{\Gamma'^{\sim}_{\mathbb{Q}}}_{\mathcal{M}(0)'} \subset \mathcal{M}^{\xi|*}(0) \subset \mathcal{M}^![0] = Z^!.$$

It would be interesting to identify, [d1] more precisely, the extension over $\Gamma_{\mathbb{Q}}$, which it induces, which corresponds to a canonical element

$$c \in H^2(\mathrm{Spec}\,\mathbb{Q}, \mu_2) \subset \mathrm{Br}(\mathbb{Q}) \tag{115}$$

Apparatus for this scan

140-3-s610-D001 *deletion. Manuscript:* the ext
Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 611]

[p. 609]

Unless I am mistaken we will have

$$c = \underset{\text{(cup-product)}}{\xi'\xi''}, \quad \text{where} \quad \xi', \xi'' \in H^2(\mathbb{Q}, \mu_2) \tag{115}$$

are the elements which describe respectively the extensions $\mathbb{Q}(\sqrt[3]{1}) = \mathbb{Q}(\sqrt{-3})$, and $\mathbb{Q}(\sqrt{3})$ — both contained, as well as $\mathbb{Q}(\sqrt{-1}) = \mathbb{Q}(i)$, in the biquadratic extension $\mathbb{Q}(\underset{\|}{i}, \underset{\|}{j}) = \mathbb{Q}(\sqrt[12]{1})$, $\sqrt[3]{-1}$ $\sqrt[3]{1}$
the field of 12th roots of unity (whose Galois group is $(\mathbb{Z}/12\mathbb{Z})^* \simeq (\mathbb{Z}/3\mathbb{Z})^* \times (\mathbb{Z}/4\mathbb{Z})^* \simeq \mu \times \mu$).

It must be trivial — when one knows a little of the foundations — that c thus made explicit is $\neq 0$, and is not split either on passing to $\mathbb{Q}(i)$, the third rogue.

Let us now consider the central μ-grouping

N.B. $Z \simeq \mathcal{M}[0]$, $\gamma \simeq \widetilde{\Gamma}_{\mathbb{Q}}$

$$\begin{aligned} \mu &\xhookrightarrow{i_{\rho,\mu}} S_0\Gamma^!_{\rho,\sigma} = Z^!_{\rho,\sigma} \times_\gamma N^*_\rho \times_\gamma N^*_\sigma \\ \varepsilon &\longmapsto (1, \varepsilon, 1) \end{aligned} \tag{116}$$

with values in

$$\mathrm{Ker}(S_0\Gamma^!_{\rho,\sigma} \longrightarrow Z^!_{\rho,\sigma}) \simeq L_\rho \times L_\sigma,$$

we thus have a canonical lifting homomorphism

$$\mathcal{M}^![0] \simeq Z^!_{\rho,\sigma} \simeq S_0^{\Pi}\Gamma^!_{\rho,\sigma}/\mu \longrightarrow S_0\Gamma^!_{\rho,\sigma}/i_{\rho,\mu}(\mu), \tag{117}$$

[scan 612]

which is made explicit in terms †[d1]|of the two fundamental canonical homomorphisms [m1283]

Marginal note. [m1283] This deserves to be made explicit in a summarizing theorem ...

$$\begin{array}{ccc} Z^!_{\rho,\sigma} & \xrightarrow{\underline{a}} & N^*_\rho/\mu, \qquad\qquad Z^!_{\rho,\sigma} \xrightarrow{\underline{b}} N^*_\sigma \\ \wr & & \\ \mathcal{M}[0] & & \\ \wr & & \\ \tilde\Gamma_{\mathbb{Q}}\,.\,L_0^{\Pi} & & \end{array} \tag{118}$$

where, I recall

$$\left\{\begin{array}{l} N^*_\rho \subset \mathcal{M} = \widetilde{N}_{1,1} \simeq \tilde\Gamma_{\mathbb{Q}}\,.\,\underbrace{\mathcal{G}^+}_{\mathrm{SL}(2,\hat{\mathbb{Z}})^\wedge} \\ \| \\ \{u \in \mathcal{M} \mid u(\rho) = \rho^{\varepsilon_3(u)}\} \\ N^*_\sigma \subset \mathcal{M} \\ \| \\ \{u \in \mathcal{M} \mid u(\sigma) = \sigma^{\varepsilon_2(u)}\ (= \varepsilon_2(u)\sigma)\}. \end{array}\right. \tag{119}$$

The maps $\underline{a}, \underline{b}$ are given by the formulas (cf. 51)

$$\left\{\begin{array}{ll} \underline{a}(u) = a = \varepsilon_3[\tau']\alpha^{-1}u, & \underline{b}(u) = b = \beta^{-1}u \quad \text{i.e.} \\ \alpha = ua^{-1}\varepsilon_3[\tau'], & \beta = ub^{-1} \end{array}\right. \tag{120}$$

where $\alpha \in \widehat{\Pi}_{0\tau}$, $\beta \in \widehat{\Pi}_0$ are characterized by

$$u(\rho) = \mathrm{int}(\alpha)(\rho), \quad u(\sigma) = \varepsilon_2(\sigma)\,\mathrm{int}(\beta)(\sigma). \tag{121}$$

The quantities [d4] $a = \underline{a}(u) \in N^*_\rho/\mu$, $b = \underline{b}(u) \in N^*_\sigma$ are characterized in terms of $u \in Z^!$ (only up to a sign) by the congruences

$$u \equiv b \quad (\widehat{\Pi}_0), \qquad u \equiv \varepsilon_3[\sigma]a \quad (\widehat{\Pi}), \tag{122}$$

which imply a fortiori (reducing mod $\mathcal{G}^{+\wedge}$), that we have commutativity of the|of,

$$\begin{array}{ccccc} & & N_\rho^*/\{\pm 1\} & & \\ & \nearrow & & \searrow^{\delta_\rho} & \\ Z^!_{\rho,\sigma} & \overset{\delta_Z}{\dashrightarrow} & & & \gamma_{\rho,\sigma} \simeq \tilde{\Gamma}_{\mathbb{Q}} \\ & \searrow & & \nearrow_{\delta_\sigma} & \\ & & N_\sigma^* & & \end{array} \tag{123}$$

d2

$\longrightarrow$

It would be time to rectify the confusion (page 594') between $Z = Z_{\rho,\sigma} \not\subset \mathcal{M}^{\circ|\bullet\sim}_{0,3}$, and $Z^! = Z^!_{\rho,\sigma} = Z \cap \mathcal{M}^{!\sim}_{0,3}$. We have in fact

$$\begin{array}{l} Z_{\rho,\sigma} \simeq \underset{\frac{1}{2}\text{-direct}}{\mathcal{M}^{\xi}(0) \,.\, L_0^{\mathcal{G}}} \subset \mathcal{M} \\ \qquad\qquad\qquad\qquad \overset{\sim}{\searrow} \\ \qquad\qquad\qquad\qquad\qquad \mathcal{M}^{\xi\sim}_{0,3}(0) \,.\, L_0^{\mathcal{G}_{0,3}} \subset \widetilde{\mathcal{M}}_{0,3} \end{array} \tag{124}$$

$$\begin{array}{l} Z^!_{\rho,\sigma} \simeq Z^!_{\rho,\sigma} \cap \mathcal{M}^! = \underset{\frac{1}{2}\text{-direct}}{\mathcal{M}(0) \,.\, L_0^{\Pi}} \subset \mathcal{M} \\ \qquad\qquad\qquad\qquad \overset{\sim}{\searrow} \\ \qquad\qquad\qquad\qquad\qquad \widetilde{\mathcal{M}}_{0,3}(0) \,.\, L_0^{\Pi_{0,3}} (\subset \widetilde{\mathcal{M}}_{0,3}) \end{array} \tag{125}$$

The link between the two is given by the diagram

$$\begin{array}{ccccccccc} 1 & \to & L_0^{\Pi} & \to & Z^!_{\rho,\sigma} & \longrightarrow & \gamma_{\rho,\sigma} & \longrightarrow & 1 \\ & & \downarrow & & \downarrow & & \| & & \\ 1 & \to & L_0^{\mathcal{G}} & \to & Z_{\rho,\sigma} & \longrightarrow & \gamma_{\rho,\sigma} & \longrightarrow & 1 \\ & & & & & & \wr & & \\ & & & & & & \mathcal{M}(0) \simeq \tilde{\Gamma}_{\mathbb{Q}} & & \end{array} \tag{126}$$

where $L_0^{\Pi} \longrightarrow L_0^{\mathcal{G}}$ is the inclusion of index 2 of

$$\begin{array}{ccc} L_0^{\Pi} = \ell_0^{\widehat{\mathbb{Z}}} & \hookrightarrow & L_0^{\mathcal{G}} = \varepsilon_0^{\widehat{\mathbb{Z}}} \\ \| & & \\ \varepsilon_0^{2\widehat{\mathbb{Z}}} & & \end{array} \tag{127}$$

Of course, it is indeed on $Z^!_{\rho,\sigma}$, not on $Z_{\rho,\sigma}$, that we defined (117), (118) whence (123).

[scan 614]

I am interested in the restriction of the homomorphisms (123) to the subgroup L_0^{Π} of $Z^!_{\rho,\sigma}$ the characterization (122) shows that the induced homomorphism

$$L_0^{\Pi} \longrightarrow N_\rho^*/\{\pm 1\}$$

[d1] is trivial (for a in terms of u depends only on u modulo $\widehat{\Pi}$), whereas the induced homomorphism

$$L_0^{\Pi} \longrightarrow N_\sigma^*$$

factors through $L_0^{\Pi}/L_0^{\Pi_0} \simeq \mathbb{Z}/2\mathbb{Z}$ (for b in terms of u depends only on u modulo $\widehat{\Pi}_0$). Its value b[i1] on [d2] ℓ_0 is [d3]characterized|characterized[i2] by the conditions

$$\{ \qquad b \in N_\sigma^*, \qquad b \equiv \ell_0 \pmod{\Pi_0}$$

which are obviously satisfied by $b = -1$. Thus There is reason to introduce also, whether we like it or not, the canonical central μ-grouping

$$\begin{array}{ccc} \mu & \hookrightarrow & N_\sigma^* \\ -1 & \longmapsto & -1 \end{array} \tag{128}$$

and we have commutativity of

$$\begin{array}{ccc} L_0^{\Pi} & \hookrightarrow & Z^!_{\rho,\sigma} \\ \downarrow & & \downarrow \\ L_0^{\Pi}/L_0^{\Pi_0} \simeq \mu & \hookrightarrow & N^*_\sigma. \end{array} \tag{129}$$

Thus we find, from the two homomorphisms (123),

[p. 611]

of $Z^!_{\rho,\sigma}$, by passage to the quotient two canonical homomorphisms

$$\left\{ \begin{array}{ccc} \gamma_{\rho,\sigma} & \longrightarrow & N^*_\rho/\{\pm 1\} \\ \| & & \\ \tilde{\Gamma}_{\mathbb{Q}} & & \\ \| & & \\ \gamma_{\rho,\sigma} & \longrightarrow & N^*_\sigma/\{\pm 1\}, \end{array} \right. \tag{130}$$

which are in fact sections of the

$$\begin{array}{ccccc} N^*_\rho/\{\pm 1\} & \longrightarrow & \gamma_{\rho,\sigma} & & \\ & & \| & & \\ & & \tilde{\Gamma}_{\mathbb{Q}} & \xleftarrow{\sim} & \mathcal{M}(0) \\ & & \| & & \\ N^*_\sigma/\{\pm 1\} & \longrightarrow & \gamma_{\rho,\sigma}, & & \end{array}$$

so that we find decompositions,

$$\left\{ \begin{array}{l} N^*_\rho/\pm 1 \simeq \gamma_{\rho,\sigma} \cdot \underbrace{SZ_\rho/\{\pm 1\}}_{=L_\rho/\{\pm 1\} \simeq \mathbb{Z}/3\mathbb{Z}} \\ N^*_\sigma/\pm 1 \simeq \gamma_{\rho,\sigma} \cdot \underbrace{SZ_\sigma/\pm 1}_{=L_\sigma/\pm \simeq \mathbb{Z}/2\mathbb{Z}} \end{array} \right. \tag{131}$$

($\frac{1}{2}$-direct products). The operation of $\gamma_{\rho,\sigma}$ on $L_\rho/\{\pm 1\} \simeq \mathbb{Z}/3\mathbb{Z}$ is given by the quadratic character ε_3, the one on $L_\sigma/\{\pm 1\} \simeq \mathbb{Z}/2\mathbb{Z}$ is given by the quadratic character ε_2.

The symmetry of presentation of the two homomorphisms (130) is a bit phony — for example the homomorphism $\tilde{\Gamma}_{\mathbb{Q}} = \gamma_{\rho,\sigma} \longrightarrow N_\sigma^*/\{\pm 1\}$ lifts in an obvious way to

$$\begin{array}{ccccc} \tilde{\Gamma}_{\mathbb{Q}} = \gamma_{\rho,\sigma} & & \longrightarrow & & N_\sigma^*, \\ & \nwarrow^{\sim} & & \nwarrow & \\ & \mathcal{M}(0) & \subset & \mathcal{M}[0] = Z^! & \end{array} \tag{132}$$

Apparatus for this scan

140-3-s615-D001 *deletion. Manuscript:* ⋉|×

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 616]

Another way to see this is to note that

$$(132) \qquad \gamma_{\rho,\sigma} \simeq \mathcal{M}_0^![0]/L_0^{\Pi_0}$$

where

$$\mathcal{M}_0^![0] \overset{\text{dfn}}{=} \mathcal{M}_{\delta|0}(0).L_0^{\Pi_0} \underset{\substack{\text{subgroup} \\ \text{of index 2}}}{\subset} \mathcal{M}^![0] = \mathcal{M}(0).L_0^{\Pi|\tau}$$

Now on $L_0^{\Pi_0}$, the homomorphism induced by

$$\mathcal{M}^![0] = Z^!_{\rho,\sigma} \longrightarrow N_\sigma^*$$

is trivial. Thus we even have a [d2] splitting of

$$\begin{array}{ccccccccc} 1 & \longrightarrow & L_\sigma & \longrightarrow & N_\sigma^* & \longrightarrow & \gamma_{\rho,\sigma} & \longrightarrow & 1 \\ & & & & & & \wr\vert & & \\ & & & & & & \tilde{\Gamma}_{\mathbb{Q}} & & \end{array} \tag{133}$$

as a $\frac{1}{2}$-direct product

$$N_\sigma^* \simeq \gamma_{\rho,\sigma}.L_\sigma$$

which it is better to write by concretizing the section subgroup as a subgroup of $G_{\rho,\sigma} \simeq \mathcal{M}$, i.e. then

$$\begin{aligned} (134) \qquad N_{0\sigma}^{!*} &\overset{\text{dfn}}{=} \mathrm{Im}(\mathcal{M}_0[0] \longrightarrow N_\rho^*) \\ &= \mathrm{Im}(\mathcal{M}[0] \hookrightarrow N_\rho^*) \\ &= \{\beta^{-1}u \mid u \in \mathcal{M}(0),\ \beta \in \widehat{\Pi}_0 \text{ such that } u(\sigma) = \varepsilon_2(u)\,\mathrm{int}(\beta)(\sigma)\} \\ &= \{v \in N_\sigma^* \mid \exists\, \beta \in \widehat{\Pi}_0 \text{ such that } \beta v \in \mathcal{M}[0] = \mathrm{Norm}_{\mathcal{M}}(l_0) \cap \mathcal{M}^!\} \end{aligned}$$

m1284

Marginal note. [m1284] N.B. We define $\mathcal{M}^!$ as the inverse image of $\mathcal{M}_{0,3}^{!\sim}$, i.e. the kernel of the canonical representation

$$\mathcal{M} \longrightarrow \underbrace{\mathcal{G}^{+\wedge}/\Pi^\wedge}_{\mathcal{G}_3} \xrightarrow{\sim} \mathrm{Aut}(\mathcal{G}^{+\wedge}/\Pi^\wedge)$$

Setting

$$(135) \qquad \mathcal{M}_0^! \overset{\text{dfn}}{=} \mathcal{M}(0).\Pi_0 \underset{\text{index } 2}{\subset} \mathcal{M}^! \overset{\text{dfn}}{=} \mathcal{M}(0).\Pi,$$

[p. 612]

so that we have

$$(136) \qquad \mathcal{M}^! \simeq \mathcal{M}_0^! \times \mu,$$

m1285

Marginal note. m1285 N.B. We have

$$\mathcal{M}_0^! \xrightarrow{\sim} \mathcal{M}_{0,3}^{!\sim}$$

we thus have

$$(137) \qquad \begin{cases} N_{\sigma 0}^{*!} = N_\sigma^* \cap \mathcal{M}_0^! \\ N_\sigma^{*!} \overset{\text{dfn}}{=} N_\sigma^* \cap \mathcal{M}^! = N_{\sigma 0}^{*!} \times \mu, \end{cases}$$

and we find that

$$(138) \qquad N_{\sigma 0}^{*!|d!} \xrightarrow{\sim} \gamma_{\rho,\sigma} = \tilde{\Gamma}_{\mathbb{Q}}$$

d2 Let us set for short

$$(139) \qquad \mathcal{M}(1/2) = N_{\sigma 0}^{*!} \qquad \text{cf. (137)}$$

we will thus have that $\mathcal{M}(1/2)$ is a|a group-i1section d4 for $N_\sigma^{*|\wedge}$ extension of $\gamma_{\rho,\sigma}$ by $L_{\sigma|\rho}$, and a fortiori for $\mathcal{M}$ extension of $\gamma_{\rho,\sigma}$ by $\mathcal{G}^{+\wedge}$, and one|we even|$\simeq$ in addition|simple for $\mathcal{M}_0^!, \mathcal{M}^!$

$$(140) \qquad \begin{cases} \mathcal{M}_0^! \simeq \mathcal{M}(1/2).\widehat{\Pi}_0 \\ \mathcal{M}^! \simeq \mathcal{M}(1/2).\widehat{\Pi} \\ \mathcal{M} \simeq \mathcal{M}(1/2).\mathcal{G}^{+\wedge} \\ N_\sigma^* \simeq \mathcal{M}(1/2).L_\sigma \end{cases}$$

m1286

Marginal note. m1286 ⟵ watch out, $\mathcal{M}^!$ is inverse in $\mathcal{M}$ and $\mathcal{M}_0^!$ is inverse in $\mathcal{M}^!$, but not in $\mathcal{M}$ cf. below

[If we want to paraphrase by introducing

$$(141) \qquad N_{\rho 0}^{*!} \overset{\text{dfn}}{=} N_\rho^* \cap \mathcal{M}_0^! = \{v \in N_\rho^* \mid \exists\, \alpha \in \widehat{\Pi}_0 \text{ such that } \underbrace{\alpha v}_{u} \in \mathcal{M}(0)\}$$

it is thus one of the v that we can associate to the $u \in \mathcal{M}(0) \subset \mathcal{M}^![0] = Z^!_{\rho,\sigma}$, using the $\alpha \in \Pi_0$ such that $\alpha^{-1}u \in N_\rho^{*|\wedge}$ i.e.

$$u(\rho) = \mathrm{int}(\alpha)(\rho^{\varepsilon_3}) \qquad \text{where} \quad \varepsilon_3 = \varepsilon_3(u) = \varepsilon_3(v).$$

But since $u(\rho)$ must have the same image in $\mathcal{G}_3 = \mathcal{G}^{+\wedge}/\Pi$ as ρ, we must have $\varepsilon_3 = 1$, and then α is the element $\underline{\alpha}(u)$ associated to u and $v = \alpha^{-1}u$ is the canonical image of u in $N_\rho^{!*}$. Thus we

find

Proposition The homomorphism $N^{*!}_{\rho 0} \longrightarrow \gamma_{\rho,\sigma} = \tilde{\Gamma}_{\mathbb{Q}}$ is injective, and has image $\gamma'_{\rho,\sigma} = \{\gamma \in \gamma_{\rho,\sigma} \mid \varepsilon_3(\gamma) = 1\}$.

Corollary $N^{*!}_{\rho,0} \subset Z_\rho^{\xi|*!}$ i.e. $N^{*!}_{\rho 0} = Z^{\xi|*!}_{0\rho|\rho 0} \overset{\text{dfn}}{=} Z_\rho^{\xi|*} \cap \mathcal{M}^!_0$.

It is natural to set

$$(142) \qquad N^{*!}_{\rho 0} = Z^!_{\rho 0} = \mathcal{M}(-\bar{j})\,..|.$$

Since $N^{*!}_\rho \supset Z^!_\rho \supset \mu$, we see that we have

$$(142) \qquad \begin{cases} N^{*!}_\rho &= N^{*!}_{\rho 0} \times \mu \quad (\text{thus } N^{*!}_\rho = Z^!_\rho) \\ Z^!_\rho \,\| &= Z^!_{\rho 0} \times \mu \end{cases}$$

The subgroup $Z^!_{0,\rho} = \mathcal{M}(-\bar{j})$ is a section of $\mathcal{M}'$ over $\gamma'_{\rho,\sigma} \simeq \Gamma'^{\sim}_{\mathbb{Q}}$, and [d4] $\mathcal{M}'^{i1}$ contained|contained in [d5] $\mathcal{M}'^!_0, \mathcal{M}'^!, , Z^!_\rho, Z_\rho$, we will have decompositions into $\frac{1}{2}$ direct products

$$(143) \qquad \begin{cases} \mathcal{M}'^!_0 \simeq \mathcal{M}(-\bar{j}).\Pi_0 \\ \mathcal{M}'^! \simeq \mathcal{M}(-\bar{j}).\Pi \\ \mathcal{M}'^{\xi|*} \simeq \mathcal{M}(-\bar{j}).\mathcal{G} \\ Z^!_\rho \simeq \mathcal{M}^{\xi|*}(-\bar{j}) \times \mu \\ Z_\rho^{\xi|*} \simeq \mathcal{M}^{\xi|*}(-\bar{j}) \times L_\rho \qquad .... \end{cases}$$

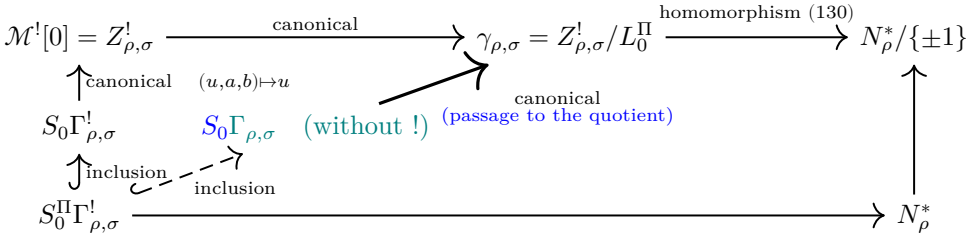
[scan 619]

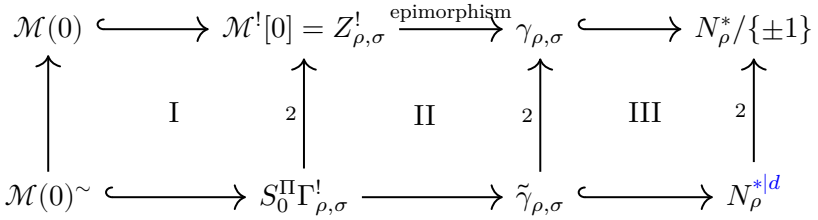
[p. 613]



Let us return to diagram (130), I say that the homomorphism

$$\begin{array}{ccc} \gamma_{\rho,\sigma} & \longrightarrow & N^*_\rho/\{\pm 1\} \\ \| & & \\ \Gamma^\sim_{\mathbb{Q}} & & \end{array}$$

does not lift to a homomorphism from $\gamma_{\rho,\sigma}$ to N^*_ρ — in other words, that the extension of $\gamma_{\rho,\sigma}$ by $\{\pm 1\} = \mu$ which it defines is not trivial.



To identify this extension, let us consider the diagram N.B.

(144)

which shows that we have a diagram of cartesian squares

(145)

where $\mathcal{M}(0)^\sim$ is defined|defined as the extension of $\mathcal{M}(0)$ by μ induced by the extension $S_0^\Pi\Gamma^!_{\rho,\sigma}$ of $\mathcal{M}^![0]$, which is thus identified also with the inverse|inverse image of

[scan 620]

the extension $\tilde{\gamma}_{\rho,\sigma}$ of $\gamma_{\rho,\sigma}$ by μ, under the composite isomorphism

$$\mathcal{M}(0) \xrightarrow{\sim} \gamma_{\rho,\sigma}.$$

So the extension $\tilde{\gamma}_{\rho,\sigma}$ of $\gamma_{\rho,\sigma}$ by μ is identified naturally|naturally with the extension $\mathcal{M}(0)^\sim$ of $\mathcal{M}(0)$ by μ which we have more or less convinced ourselves was not trivial.

Here is another way of obtaining the canonical homomorphism

$$\gamma_{\rho,\sigma} \longrightarrow N^*_\rho/\pm 1,$$

and the extension $\tilde{\gamma}_{\rho,\sigma}$ of $\gamma_{\rho,\sigma}$. Let us consider

$$(146) \qquad N^{*!}_\rho = N^*_\rho \cap \mathcal{M}^!$$

We then have

$$(147) \qquad N^{*!}_\rho \cap \mathcal{G}^+ = \mathrm{Ker}(N^{*!}_\rho \longrightarrow \underbrace{\gamma_{\rho,\sigma}}_{\Gamma^\sim_{\mathbb{Q}}}) = L_\rho \cap \Pi = \mu$$

on the other hand the homomorphism

$$(148) \qquad N_\rho^{*!} \longrightarrow \gamma_{\rho,\sigma} \quad \text{is an epimorphism}$$

For [d1] it suffices to see that for[i1] $\forall\, u \in \mathcal{M}(0)$, there exists an element of $N_\rho^{*!}$ which is congruent to it, modulo $\mathcal{G}$[i2] Now we have

$$u(\rho) = \mathrm{int}(\alpha)(\rho)$$

with $\alpha \in \widehat{\Pi}_\tau = \{1,\tau\}.\widehat{\Pi}$,[i3] if $\varepsilon_3(u) = 1$ i.e. $\alpha \in \widehat{\Pi}$, $\alpha^{-1}u \in Z_\rho \subset N_\rho^*$ does the job. If [d5] $\varepsilon_3 = | \neq -1$[i4], we have [d6]

$$\alpha = \alpha_0\tau, \qquad \alpha_0 \in \widehat{\Pi}.$$

and we have

$$u(\rho) = \alpha(\rho) = \alpha_0(\underbrace{\tau(\rho)}_{\sigma(\rho^{-1})}) = \alpha_0(\sigma(\rho^{-1}))$$

so

$$(\sigma^{-1}\alpha_0^{-1}u)(\rho) = \rho^{-1} \quad \text{so} \quad \sigma^{-1}\alpha_0^{-1}u \in N_\rho^*.$$

OK.

[p. 614]

So we have an exact sequence

(149)

$$\begin{array}{ccccccccc} 1 & \to & \mu & \longrightarrow & Z_\rho^{*!} & \longrightarrow & \gamma_{\rho,\sigma} & \to & 1 \\ & & & & & & \wr\vert & & \\ & & & & (\simeq \tilde{\gamma}_{\rho,\sigma}) & & \tilde{\Gamma}_{\mathbb{Q}} & & \end{array}$$

which makes $Z_\rho^{*!}$ a μ-extension of $\gamma_{\rho,\sigma}$, hence a canonical homomorphism

$$\gamma_{\rho,\sigma} \simeq Z_\rho^{*!}/\mu \longrightarrow N_\rho^*/\mu$$

which, of course, is none other than the first homomorphism (130).

9°) Recapitulation on the universal case.

Finally, I have the impression that I have again made long detours and contortions, to finally get lost in the sands, and lose the thread a little. So I am going to recapitulate what seems essential to me.

ⓐ

$$(1) \qquad Z_{\rho,\sigma} \simeq \mathcal{M}(0).L_0^{\mathcal{G}} = \mathcal{M}[0]$$

(operating on $\widehat{\mathcal{G}}^+$ by operation induced by the adjoint)

we distinguish inside it a subgroup of index 2

$$(2) \qquad Z_{\rho,\sigma}^{!} \simeq \mathcal{M}(0).L_0^{\Pi}.$$

Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

[scan 622]

We have

$$(3) \qquad G_{\rho,\sigma} \simeq \mathcal{M}$$

and, [d1] more precisely, the diagram
(4)

$$\begin{array}{ccccccccc} 1 & \longrightarrow & L_0 & \longrightarrow & Z_{\rho,\sigma} & \longrightarrow & \gamma_{\rho,\sigma} & \longrightarrow & 1 \\ & & \downarrow & & \downarrow & & \| & & \\ 1 & \to & \mathcal{G}^{+\wedge}_{\rho,\sigma} & \to & G_{\rho,\sigma} & \to & \gamma_{\rho,\sigma} & \to & 1 \end{array}$$

is identified with the diagram
(4 bis)

$$\begin{array}{ccccccccc} & & & & \overset{\mathcal{M}(0).L_0^{\mathcal{G}}}{\widehat{\mathcal{M}[0]}} & & & & \\ 1 & \to & L_0^{\mathcal{G}} & \to & \downarrow & \to & \tilde{\Gamma}_{\mathbb{Q}} & \to & 1 \\ & & \downarrow & & & & \wr & & \\ 1 & \to & \widehat{\mathcal{G}}^{+} & \longrightarrow & \mathcal{M} & \longrightarrow & \tilde{\Gamma}_{\mathbb{Q}} & \to & 1. \end{array}$$

Moreover, the homomorphisms
(5)

$$\begin{array}{ccccc} & & & \overset{\varepsilon'_\gamma=\varepsilon_\gamma^{\rho}}{\nearrow} & \mu \\ \gamma_{\rho,\sigma} & & \longrightarrow & & \widehat{\mathbb{Z}}^* \\ & & & \underset{\varepsilon''_\gamma=\varepsilon_\gamma^{\rho|\sigma}}{\searrow} & \mu \end{array}$$

are identified:
(5 bis)

$$\begin{array}{ccccc} & & & \overset{\varepsilon_3}{\nearrow} & \mu \\ \tilde{\Gamma}_{\mathbb{Q}} & & \overset{\chi}{\Longrightarrow} & & \widehat{\mathbb{Z}}^* \\ & & & \underset{\varepsilon_2}{\searrow} & \mu. \end{array}$$

ⓑ We have /

$$(6) \qquad N_\sigma^* = \left\{ u \in \mathcal{M} \;\middle|\; u(\sigma) = \sigma^{\varepsilon_2(u)} \begin{array}{r} (= \varepsilon_2(u).\sigma) \\ = \varepsilon_2[\tau](\sigma) \\ = \varepsilon_2[\tau'](\sigma) \end{array} \right\}$$

[d3] and

$$(7) \qquad \begin{cases} N_\sigma^* \cap \widehat{\mathcal{G}} = \mathbb{D}_\sigma = \{1,\tau\}.L_\sigma = \{1,\tau'\}.L_\sigma \\ N_\sigma^* \cap \mathcal{G}^{+\wedge} = L_\sigma \qquad (\simeq \mathbb{Z}/4\mathbb{Z}) \\ N_\sigma^* \cap \Pi = \mu \\ N_\sigma^* \cap \Pi_0 = \{1\} \end{cases} .$$

Scans 625–643

[scan 625]

[p. 616]

Now let

$$\mu_{\tau'} = \{1, \tau'\} \subset \mathcal{G}^\wedge \tag{20}$$

then $\mu_{\tau'}$ normalizes L_ρ [i1], [d1] for $\tau'(\rho) = \rho^{-1}$ whence $\tau'(L_\rho) = L_\rho$ hence it normalizes $Z_\rho \equiv | = \mathrm{Cent}_{\mathcal{M}}(L_\rho)$, hence also $Z^!_\rho = Z_\rho \cap \mathcal{M}^!$ (since $\mathcal{M}^!$ is invariant in $\mathcal{M}$) $= Z^!_{\rho,0} \times \mu = \mathcal{M}'(-\bar{\jmath}) \times \mu$. [d2] Moreover $\mu_{\tau'} \cap Z^!_\rho \subset \mu_{\tau'} \cap \mathcal{M}^! = \{1\}$. Let

$$\mathcal{N}^?_\rho = \mu_{\tau'} \cdot Z^!_\rho = \mu_{\tau'} \cdot \underbrace{(Z^!_{\rho,0} \times \mu)}_{\substack{\mathcal{M}(-\bar{\jmath})\times\mu \\ \simeq \Gamma'^{\sim}_{\mathbb{Q}} \times \mu}} \quad . \tag{21}$$

($\frac{1}{2}$ direct product)

One should be aware that contrary to what this notation might suggest, $\mu_{\tau'}$ does not normalize $Z^!_{\rho,0}$ — otherwise one would have a decomposition|arrangement into a product

$$\mathcal{N}^?_\rho = \mathcal{N}^?_{\rho,0} \times \mu, \quad \text{where } \mathcal{N}^?_{\rho,0} = \mu_{\tau'} \cdot Z^?_{\rho,0} | Z^!_{\rho,0},$$

but this is not the case. We have an exact sequence

$$\begin{array}{ccccccccc} 1 & \longrightarrow & \mu & \longrightarrow & \mathcal{N}^?_\rho & \longrightarrow & \gamma_{\rho,\sigma} & \longrightarrow & 1 \\ & & & & & & \| & & \\ & & & & & & \Gamma^{\sim}_{\mathbb{Q}} & & \end{array} \tag{22}$$

so that $\mathcal{N}^?_\rho$ is a quasi-section of multiplicity 2 of the extension $\mathcal{N}^*_\rho \longrightarrow \gamma_{\rho,\sigma}$, — of $\mathcal{M} \longrightarrow \gamma_{\rho,\sigma} = \Gamma^{\sim}_{\mathbb{Q}}$. Thus we find 624

[scan 626]

$$\begin{cases} \mathcal{M} = \mathcal{N}^?_\rho \wedge_{\mu_2} \mathcal{G}^{+\wedge} \\ \mathcal{N}^*_\rho = \mathcal{N}^?_\rho \wedge_{\mu_2} L_\rho \simeq \mathcal{N}^?_\rho \times \underbrace{L_{-\rho}}_{\simeq \mathbb{Z}/3\mathbb{Z}} \end{cases} \tag{23}$$

The [d2]extension[i1] (22) of $\gamma_{\rho,\sigma}$ by μ is the extension denoted by $\tilde{\gamma}_{\rho\sigma}$ in the preceding section, it is surely not split. It gives rise to a canonical homomorphism

$$\gamma_{\rho,\sigma} \xrightarrow{\sim} \mathcal{N}^?_\rho/\mu \longrightarrow \mathcal{N}^*_\rho/\mu. \tag{24}$$

Remark To do it properly, one would have to make explicit the operation of τ' on $Z^!_\rho \simeq Z^!_{\rho,0} \times \mu \xrightarrow{\sim} \Gamma'^{\sim}_{\mathbb{Q}} \times \mu$, in terms of the operation of the image τ_Γ of τ' on $\Gamma'^{\sim}_{\mathbb{Q}}$ by inner automorphism (N.B. τ_Γ is none other than the element of $\Gamma_{\mathbb{Q}} \subset \Gamma^{\sim}_{\mathbb{Q}}$, "complex conjugation") and of a homomorphism from $\Gamma'^{\sim}_{\mathbb{Q}}$ to μ i.e. of a "quadratic character" of $\Gamma'^{\sim}_{\mathbb{Q}}$[i3] — it is a good bet that this is precisely ε_2 — so that $\Gamma^{0\sim}_{\mathbb{Q}} \simeq \Gamma'^{\sim}_{\mathbb{Q}} \cap \Gamma''^{\sim}_{\mathbb{Q}}$ appears as invariant under τ' …In short, it would be well to take up again the study of the extension made in the preceding section, by starting there from the point of view of the associated α, β, 625

[scan 627]

[p. 617]

in the present perspective, probably simpler. It would be well at the same time to [d1]make explicit[i1] another partial section, which [d2] would be over $\Gamma'''^{\sim}_{\mathbb{Q}}$,

$$\Gamma'''^{\sim}_{\mathbb{Q}} = \{x \in \Gamma^{\sim}_{\mathbb{Q}} \mid \varepsilon_2(x)\varepsilon_3(x) = 1\},$$

and which would perhaps deserve the notation $\mathcal{M}(\sqrt{3})$ or at least $\mathcal{M}(q)$, for a suitable generator $q|\rho$ of $\mathbb{Q}(\sqrt{3})$??? [m1291]

Marginal note. [m1291] ? Ponder these coincidences. Attentive.|attentively

I realize that I am talking crap — having somewhat lost touch with the geometric content of my calculations. One must keep in mind that

$$\mathcal{M}^{!}_{0} \xrightarrow{\sim} \mathcal{M}^{!\sim}_{0,3} \tag{25}$$

corresponds up to $\sim$, to the π_1 of $U_{0,3\mathbb{Q}}$, the sections of $\mathcal{M}^{!}_{0} \longrightarrow \Gamma^{\sim}_{\mathbb{Q}} \simeq \gamma_{\rho,\sigma}$ thus correspond (up to $\sim$) to those of $\pi_1(U_{0,3\mathbb{Q}})$ over $\Gamma_{\mathbb{Q}}$, thus ("invariably|inevitably|unavowably") to the rational/$\mathbb{Q}$[i2] points of $U_{0,3\mathbb{Q}}$ — when they are partial sections, to the points of $U_{0,3\mathbb{Q}}$ with values in finite extensions of $\mathbb{Q}$. Thus, [d4] the section [d5]considered[i3] in b) does indeed correspond to the pt $\frac{1}{2}$ of $U_{0,3\mathbb{Q}}$, the [d6]section partial $\mathcal{M}(-\bar{\jmath})$[i4] considered here in c) corresponds to the point $-\bar{\jmath}$ of $U_{0,3\mathbb{Q}}$, which is in $U_{0,3}(\mathbb{Q}[\sqrt[3]{1}])$, so the notation $\mathcal{M}(-\bar{\jmath})$[i5] is reasonable. As for $\mathcal{N}^{\sim}_{\rho}$, it is not $\subset \mathcal{M}^{!}_{0}$ — even on dividing by μ; one finds after division by μ a section 626

[scan 628]

of $\mathcal{M}^{\sim}_{0,3}$ over $\Gamma^{\sim}_{\mathbb{Q}}$, but this is not a section of $\mathcal{M}^{!\sim}_{0,3}$. Now up to $\sim$, $\mathcal{M}^{\sim}_{0,3}$ is the π_1 of $M'_{1,1\mathbb{Q}}$, moduli scheme over $\mathbb{Q}$ of elliptic curves mod symmetry. Thus giving this section corresponds to giving such an "elliptic curve mod symmetry" over $\mathbb{Q}$. Passing to the [d1] subgroup $\Gamma'^{\sim}_{\mathbb{Q}}$ — which corresponds to the extension of the base field from $\mathbb{Q}$ to $\mathbb{Q}(j) = \mathbb{Q}(\sqrt[3]{1})$ one recovers the image in $\mathcal{M}^{!\sim}_{0,3}$ of the preceding [d2] section partial[i1] — [d3] to $\mathcal{M}(-\bar{\jmath})$ — this thus shows that it is still the "same" elliptic curve. I thus have the impression [d4] however that over the whole of $\Gamma^{\sim}_{\mathbb{Q}}$, this section of $\mathcal{M}^{\sim}_{0,3}$ cannot be lifted to a section of $\mathcal{M}_{\mu}|\mathcal{M}$ over $\Gamma^{\sim}_{\mathbb{Q}}$ — i.e. precisely that the extension $\mathcal{N}_{\rho}^{?|*}$ of $\Gamma^{\sim}_{\mathbb{Q}}$ by μ is nontrivial. Would this mean that there is no elliptic curve defined/$\mathbb{Q}$ with invariant 0? (Something that seems absurd — one must be able over a field to give any invariant…). ?

To be precise, we have the diagram of moduli schemes over $\mathbb{Q}$

, (26)

the fact that a point of $M'_{1,1}(\mathbb{Q})$ does not li- 627

[scan 630]

liftings to $M_{1,1}$ of a point of $M'_{1,1}$ rational/$\mathbb{Q}$ identify with the $\widetilde{\mathcal{G}}_3$-[i1]torsors $\tilde{T}$ which lift the $\mathcal{G}_3$-torsor T, i.e. (up to isomorphism) they correspond to the homomorphisms $\Gamma_{\mathbb{Q}} \longrightarrow \widetilde{\mathcal{G}}_3$ which lift the homomorphism $\Gamma_{\mathbb{Q}} \longrightarrow \mathcal{G}_3$ which defines T: [m1297]

Marginal note. [m1297] we suppose now chosen a [d1] point of $T(\overline{\mathbb{Q}}_0)$

$$\begin{array}{ccc} & & \widetilde{\mathcal{G}}_3 \\ & \nearrow & \downarrow \\ \Gamma_{\mathbb{Q}} & \longrightarrow & \mathcal{G}_3 \end{array} \quad -$$

the obstruction is, as it should be, an extension of $\Gamma_{\mathbb{Q}}$ by μ_2, i.e. an element of $H^2(\mathbb{Q}, \mu_2) \simeq {}_2\mathrm{Br}(\mathbb{Q})$. In the case at hand, the image of T in $U_{0,3}$ is made up of $\{-\bar{\jmath}, -j|-\bar{\jmath}\}$ which is connected over $\mathbb{Q}$, hence $\Gamma_{\mathbb{Q}} \longrightarrow \mathcal{G}_3$ is surjective. [m1298]

Marginal note. [m1298] corrected|erroneous, cf. correction below

In general, [d2] in the Galois-theoretic translation in terms of splittings of $\mathcal{M}_{0,3}$ over $\Gamma_{\mathbb{Q}}$, the homomorphism $\Gamma_{\mathbb{Q}} \longrightarrow \mathcal{G}_3$ is the composite

$$\Gamma_{\mathbb{Q}} \xrightarrow{k|\kappa} \mathcal{M}_{0,3} \longrightarrow \mathcal{G}_3 \ ,$$

which is trivial iff [d3] $k|\kappa$[i2] is a section of [d4]

$$\mathcal{M}^{!}_{0,3} = \mathrm{Ker}(\mathcal{M}_{0,3} \longrightarrow \mathcal{G}_3)$$

over $\Gamma_{\mathbb{Q}}$. Here we have a section of $\mathcal{M}^{!}_{0,3}$ [d5]above[i3] the subgroup $\Gamma'_{\mathbb{Q}}$ of index 2, [d6] $k|\kappa \mid \Gamma'_{\mathbb{Q}} = 1$, hence $k|\kappa(\Gamma_{\mathbb{Q}}) \subset \mathcal{G}_3$ is of order 2, we see that 629

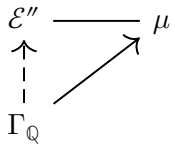
[scan 631]

[p. 619]

it is the subgroup $\{1, \dot\sigma_\infty\}^{\text{i1}}$ of $\mathcal{G}_3$. (for the image of $\tau' = \sigma\tau \in \mathcal{M}_{0,3}$ in $\mathcal{G}_3$ [d1] (since that of τ is 1) is equal to that of $\sigma = \sigma_\infty$, i.e. $\dot\sigma_\infty$. This means that [d2] we have

$$T \simeq T_0 \wedge_{\{1,\dot\sigma_\infty\}} \mathcal{G}_3$$



i.e. T is obtained from a μ-torsor (i.e. from a quadratic extension of $\mathbb{Q}$) — namely precisely $\mathbb{Q}(\sqrt[3]{1}) = \mathbb{Q}(j)$) by extension of the groups of operators $\mu \longrightarrow \mathcal{G}_3 \quad (-1 \longmapsto \dot\sigma_\infty)^{\text{i3}}$. Thus, taking the inverse image of $\mu = \{1, \dot\sigma_\infty\}$ in $\widetilde{\mathcal{G}}_3$, we find an extension of μ by μ — it can hardly be anything but $\mathbb{Z}/4\mathbb{Z}$! — which I feel like denoting $\mathcal{E}''$

$$1 \to \mu \longrightarrow \overset{\mathbb{Z}/4\mathbb{Z}}{\overset{\cdot\cdot}{\mathcal{E}''}} \longrightarrow \mu \to 1$$

m1300

Marginal note. [m1300] yes, this is obvious since $\sigma = \sigma_\infty$ in $\widetilde{\mathcal{G}}_3 = \mathrm{SL}(2,\mathbb{Z})/\Pi_0|\Pi$ is indeed of order 4, so $\mathcal{E}'' \simeq \mathbb{Z}/4\mathbb{Z}$ canonically…

and the problem of obstruction is to find a lifting

, (which [d3] surely does not exist) — so the obstruction is identified as the extension of $\Gamma_{\mathbb{Q}}$ by μ, inverse image of the extension $\mathcal{E}''$. [m1301]

Marginal note. [m1301] This is obvious in effect|fact, that we|since : $(\Gamma_{\mathbb{Q}})_{\mathrm{ab}} \simeq \widehat{\mathbb{Z}}^* \supset \mathbb{Z}_3^*$, now $(\mathbb{Z}_3^*)_4 \simeq \mathbb{Z}/2\mathbb{Z}$ (so already on $\mathbb{Z}_3^*$ it does not lift…

(One should look at why, in 630

[p. 620]

Thus we have the diagram

$$\begin{array}{ccccc} \widetilde{\mathcal{G}}_3 & \xrightarrow{\text{can}} & \mathcal{G}_3 & \xrightarrow{\text{sg}} & \mu \\ & & & \nearrow & \\ & & \Gamma_{\mathbb{Q}} & & \end{array} \tag{31}$$

m1304

Marginal note. [m1304] N.B. the kernel of $\widetilde{\mathcal{G}}_3 \longrightarrow \mu$ is a central[i1] extension of $\mathbb{Z}/3\mathbb{Z}$ by $\mu = \mathbb{Z}/2\mathbb{Z}$, it is therefore trivial and isomorphic to $\mathbb{Z}/6\mathbb{Z}$ (kernel generated by ρ).

We thus see that the category of liftings of the $\mathbb{Q}$-rational point 0 of $\mathbb{E}^1$ to a $\mathbb{Q}$-rational point of $M'_{1,1}$ resp. $M_{1,1}$, is equivalent to that of $\mathcal{G}_3$-torsors P[i2] resp. of $\widetilde{\mathcal{G}}_3$-torsors $\tilde{P}$[i3] over $\mathbb{Q}$, which lift the μ-torsor P_0.

We had chosen a $P = T$ in a particularly trivial|trivial way, using the splitting

$$\mu \xrightarrow{\sim} \{1, \dot{\sigma}_\infty\} \hookrightarrow \mathcal{G}_3$$

of $\mathcal{G}_3 \longrightarrow \mu$ — but the torsor T does not lift to a $\tilde{T}$. The isomorphism classes of points of $M'_{1,1}$ resp. of $M_{1,1}$ over the point 0 of $\mathbb{E}^1$, correspond likewise to the conjugacy classes (modulo kernels $\mathcal{G}_3^+, \widetilde{\mathcal{G}}_3^{+\text{i5}}$ of $\mathcal{G}_3 \longrightarrow \mu$ and $\widetilde{\mathcal{G}}_3 \longrightarrow \mu$)[i4] of liftings of $\Gamma_{\mathbb{Q}} \longrightarrow \mu$ to $\Gamma_{\mathbb{Q}} \longrightarrow \mathcal{G}_3$ resp. to $\Gamma_{\mathbb{Q}} \longrightarrow \widetilde{\mathcal{G}}_3$.

[d1] Let us consider a lifting to

$$\Gamma_{\mathbb{Q}} \longrightarrow \mathcal{G}_3$$

, its image is a subgroup of $\mathcal{G}_3$, which is either 632

$\{1, \dot{\sigma}_\infty\}$ or one of its conjugates, $\{1, \dot{\sigma}_0\}$, $\{1, \bar{\sigma}_1|\dot{\sigma}_1\}$, or it is the whole of $\mathcal{G}_3$. In the first case, we have seen that it does not lift to $\widetilde{\mathcal{G}}_3$. So to be able to lift, one must take an epimorphism $\Gamma_{\mathbb{Q}} \longrightarrow \mathcal{G}_3$ — so we leave the abelian setting over $\mathbb{Q}$, to enter the domain of abelian extensions of $\mathbb{Q}(j)$.

To examine in terms of Galois groups whether there exists such a lifting [d1] $\Gamma_{\mathbb{Q}} \longrightarrow \widetilde{\mathcal{G}}_3$, and [d2] how to obtain them, appears as a pleasant and delectable exercise in class field theory, which I am not going to pursue for the moment, so as not to make this digression last forever. Returning later to this point, I would need at the same time to make explicit the relation between the choices|points of a lifting of the homomorphism from $\Gamma_{\mathbb{Q}}$, and splittings of the extension $\mathcal{M}_{0,3}$ of $\Gamma_{\mathbb{Q}}$ by $\mathcal{G}_{0,3}^{+\wedge}|\widetilde{\mathcal{G}}_{0,3}^{+\wedge}$, or $\mathcal{M}$ of $\Gamma_{\mathbb{Q}}$ by $\mathcal{G}^{+\wedge} \simeq \mathrm{SL}(2,\mathbb{Z})^\wedge$. 633

[p. 623]

even invariant in $\mathcal{N}^*_\rho$, since [d1]. $Z_\rho, \mathcal{M}^!, \mathrm{Ker}\,\varepsilon_2$ are stabilized by $\mathcal{N}^*_\rho$. Besides, [d2] $Z^!_{\rho,0} = \mathcal{M}'(-\bar{j})$ is [d3]invariant[i1] [d4]in[i2] $Z^!_\rho = \mathcal{M}'(-\bar{j}) \times \mu$, to show that it is so in Z_ρ, it suffices to prove that it is normalized by ρ (since $Z_\rho = L_\rho \,.\, Z^!_\rho$ – this is $\pm$ trivial), now let us examine in general for [d5] $x \in \mathcal{M}$ whether x normalizes [d6]

$$\mathcal{M}^!_0 \overset{\text{dfn}}{=} \mathcal{M}(0) \,.\, \Pi_0,$$

Since it normalizes Π_0, it suffices to see whether for $u \in \mathcal{M}(0)$, we have

$$xux^{-1} \in \mathcal{M}^!_0$$

which is also equivalent to

$$xux^{-1} \equiv u \qquad (\Pi_0)$$

i.e.

$$[x,u]\in\Pi_0$$

now we know that for $x\in\mathcal{G}$, $u\in\mathcal{M}^{!}$,[i3] we have

$$\underbrace{[x,u]}_{x\,u(x)^{-1}}^{c}\equiv(\mathrm{sg}(x))^{\xi_2(u)|\varepsilon_2(u)}\mod\Pi_0 \qquad (*)$$

where

$$\mathrm{sg}:\qquad \mathcal{G}\xrightarrow{\text{can}}\mathcal{G}_3\xrightarrow{\text{sg}}\mu.$$

This shows [d8] that

Lemma

$$\begin{cases}\text{If } x\in\mathcal{G}^{+},\ u\in\mathcal{M}_0^{!}, & \text{then equivalent conditions}\\ a)\quad xux^{-1}\in\mathcal{M}_0^{!}\\ b)\quad xux^{-1}\equiv u\quad(\Pi_0)\quad\text{i.e.}\quad[x,u]\in\Pi_0\\ c)\quad .\mathrm{sg}(x)^{\xi_2(u)|\varepsilon_2(u)}=1\quad\text{i.e.}\quad \mathrm{sg}(x)=1\quad\underline{\text{or}}\quad\varepsilon_2(u)=1\end{cases}$$

[scan 640]
d1

Corollary 1 Let $x \in \mathcal{G}^{+\wedge}$. For x to normalize $\mathcal{M}_0^!$, it is necessary and sufficient that we have $\mathrm{sg}(x) = +1$.

Corollary 2. The subgroup $\mathcal{M}_0'^! = \mathcal{M}''(0) \,.\, \Pi_0$ is d3 normalized by $\mathcal{G}^{+\wedge}$.

This shows in particular that ρ normalizes $\mathcal{M}_0^!$, hence also $\mathcal{M}'(-\bar{j}) = Z_{\rho,0}^! = Z_\rho \cap \mathcal{M}_0^!$, which is therefore invariant in Z_ρ. The same therefore holds for its intersection with $\mathcal{M}^0(-\bar{j}) \times \mu$, i.e. $\mathcal{M}^0(-\bar{j})$. (Or again; this group is equal to $Z_\rho \cap \mathcal{M}_0'^!$, and $\mathcal{M}_0'^!$ is normalized by ρ ...). Thus the four groups (39) are normal in Z_ρ.)

To see whether they are normal in $\mathcal{N}_\rho^* = \mu_{\tau'} . Z_\rho$, it suffices to see whether they are normalized by τ'. This is clear for $Z_\rho^! = Z_\rho \cap \mathcal{M}^!$ – whence the fact that $\mathcal{N}_\rho^? = \mu_{\tau'} \,.\, Z_\rho^!$ is a subgroup of $\mathcal{N}_\rho^*$. To d4 see d5 which of the i3 three other subgroups considered i4 last are normalized, it would therefore be necessary to make explicit the action of τ' d6 on $Z_\rho^! = \mathcal{M}'(-\bar{j}) \times \mu$. 639

[scan 641]

[p. 623]

Let us note that $\tau \in \mathcal{M}(0) \subset \mathcal{M}'_0$ normalizes $\mathcal{M}'_0$, so [d1]it[i1] operates [d2] on $\mathcal{M}' = \underbrace{\mathcal{M}'_0}_{\simeq \widetilde{\Gamma}_{\mathbb{Q}}.\Pi_0} \times \mu$ by the product operation of conjugation by τ in $\mathcal{M}'_0$, and the identity in μ. On the other hand we have $\tau' = \tau\sigma$, we have seen that

$$(40) \qquad \sigma(x) \equiv \varepsilon_2(x)x \qquad (\Pi_0) \qquad x \in \mathcal{M}$$

hence

$$(41) \qquad \tau'(x) \equiv \varepsilon_2(x)\tau(x) \qquad (\Pi_0) \qquad x \in \mathcal{M}$$

so it follows

$$(42) \quad \begin{cases} \text{if } x \in \mathcal{M}'_0, \quad \text{then } \tau'(x) \equiv x \quad (\Pi_0) \Longleftrightarrow \tau'(x) \in \mathcal{M}'_0 \Longleftrightarrow \varepsilon_2(x) = 1 \\ \text{in particular, } \mathcal{M}''^{!}_0 \text{ is normalized by } \tau \end{cases}$$

Thus [d3] applying this to the elements of $Z^!_{\rho,0} = \mathcal{M}'(-\bar{j})$ in $Z^!_\rho = \mathcal{M}'(-\bar{j}) \times \mu$, we find

$$(43) \quad \begin{cases} \text{Let } x \in Z^!_{\rho,0} = \mathcal{M}'(-\bar{j}), \text{ then} \\ \tau'(x) \in Z^!_{\rho,0} \Longleftrightarrow \varepsilon_2(x) = 1 \end{cases}$$

Corollary $Z^!_{\rho,0} = \mathcal{M}'(-\bar{j})$ is not normalized by τ', hence is not invariant in $\mathcal{N}^*_\rho$, but [d5] $\mathcal{M}^0(-\bar{j}) = Z_\rho \cap \mathcal{M}''^{!}_0$ is normalized by τ', hence also its product with μ.

Thus the only one of the four subgroups (39) of Z_ρ which is not normal in $\mathcal{N}_\rho$ is $\mathcal{M}'(-\bar{j}) = Z^!_{\rho,0}$. The others give 640

[scan 642]

rise, by $\frac{1}{2}$ direct product with $\mu_{\tau'}$, to subgroups|subgroups of $\mathcal{N}_\rho$, invariant in $\mathcal{N}_\rho$. The smallest of all these subgroups is $\mathcal{M}^0(-\bar{j})$, which is of index 24 in $\mathcal{N}_\rho^*$. The quotient group [d1]

$$\mathcal{N}_\rho^*/\mathcal{M}^0(-\bar{j})$$

is therefore a group of order 24, which moreover receives the group $\mathbb{D}_\rho = \mu_{\tau'} \cdot L_\rho \subset \mathcal{N}_\rho^*$, normalizer of L_ρ in $\mathrm{GL}(2,\mathbb{Z})$, a group isomorphic to D_6, and of order 12. The kernel of

$$(44) \quad \mathbb{D}_\rho \hookrightarrow \mathcal{N}_\rho^*/\mathcal{M}^0(\bar{j})$$

is obviously contained in $L_\rho = \mathbb{D}_\rho \cap Z_\rho$ and it is reduced to 1 for since we even have

$$L_\rho \cap Z^!_{\rho,0} \subset L_\rho \cap \mathcal{M}^!_0 = L_\rho \cap \Pi_0 = \{1\}.$$

Thus $\mathbb{D}_\rho$(of order 12) appears as a subgroup of index 2 of $\mathcal{N}_\rho^*/\mathcal{M}^0(-\bar{j})$, just as it is a subgroup of index 2 of $\mathcal{G}/\Pi_0$. It would be tempting 641

[p. 624]

then to establish an isomorphism

$$\mathcal{N}_\rho^*/\mathcal{M}^0(-\bar{j}) \overset{?}{\simeq} \mathcal{G}^\wedge/\Pi_0$$

compatible with these embeddings of $\mathbb{D}_\rho$. Let us try it this way|also:

Proposition Let us consider the composite homomorphism

$$(45) \quad \mathcal{M} \xrightarrow{\Theta_{\mathcal{M}}} \mathrm{GL}(2,\widehat{\mathbb{Z}}) \longrightarrow \mathrm{GL}(2,\mathbb{Z}/4\mathbb{Z}) \xrightarrow{\text{epimorphism of degree 4}} \mathcal{G}^{*|\wedge}/\Pi_0 \simeq \mathcal{G}^\wedge/\Pi_0^\wedge$$

$$\mathrm{GL}(2,\mathbb{Z}) \,/\, \mathcal{G}[4] \quad (\mathcal{G}) \qquad \mathrm{GL}(2,\mathbb{Z}/4\mathbb{Z}) \xleftarrow{\sim} \mathrm{GL}(2,\mathbb{Z}) \,/\, \mathcal{G}[4]$$

[d1] which induces on $\mathcal{G}^\wedge \subset \mathcal{M}$ the canonical homomorphism $\mathcal{G}^\wedge \longrightarrow \mathcal{G}^\wedge/\Pi_0^\wedge$. Then the homomorphism [d2]induced[i1]

$$\mathcal{N}_\rho^* \longrightarrow \mathcal{G}/\Pi_0$$

has as kernel $\mathcal{M}^0(-\bar{j})$, and induces by passage to the quotient an isomorphism

$$(46)\quad \mathcal{N}_\rho^*/\mathcal{M}^0(-\bar{j}) \xrightarrow{\sim} \mathcal{G}/\Pi_0$$

Proof. The elements of $\mathcal{M}^0(-\bar{j})$ are the elements of the form

$$\left\{ v = \alpha^{-1}u \;\middle|\; \begin{array}{ll} u \in \mathcal{M}(0), & \alpha \in \Pi_0 \\ u(\rho) = \alpha(\rho) & (\text{thus } \varepsilon_3(u) = 1) \\ \varepsilon_2(u) = 1 & \end{array} \right\}$$

they are in 1-1 correspondence with the elements of

$$\mathcal{M}^0(0) = \{u \in \mathcal{M}(0) \mid \varepsilon_2(u) = \varepsilon_3(u) = 1\}.$$

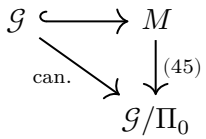
Scans 644–662

[scan 644]

$v|u$ in $\mathrm{Gl}(2,\widehat{\mathbb{Z}})/\operatorname{Im}\widehat{\Pi}_0^\circ$, factored through $\mathcal{G}/\Pi_0$, is equal to that of u. Thus the assertion that $M^\circ(-\bar{j})$ is in the kernel of $M \longrightarrow \mathcal{G}/\Pi_0$, is equivalent [d1]to the assertion[i1] that $M^\circ(0)$ is in this kernel, hence that we have a commutative diagram

$$\begin{array}{ccc} M(0) & \longrightarrow & M \\ {\scriptstyle(\varepsilon_2,\varepsilon_3)}\downarrow & & \downarrow{\scriptstyle(45)} \\ \mu \times \mu & \xrightarrow{?} & \mathcal{G}/\Pi_0 \end{array}$$



m1317

Marginal note. [m1317] [d2] N.B. [d3] the correction|condition ε_3 does not enter into the definition (47) of $M \longrightarrow \mathcal{G}/\Pi_0$, cf. further on.

Note that the composite

$$\begin{array}{ccccc} M & \longrightarrow & \mathcal{G}/\Pi_0 & \longrightarrow & (\mathbb{Z}/4\mathbb{Z})^* \simeq \{\pm 1\} \\ & \searrow & & \nearrow & \uparrow \\ & & \mathrm{Gl}(2,\mathbb{Z}/4\mathbb{Z})^* & \longleftarrow & \end{array}$$

is none other than ε_2. Note also that by the compatibility

the operation of M on $\mathcal{G}/\Pi_0$ deduced from the homomorphism (45) is none other than the operation [d6]of a topological group|of quotients[i2], of automorphisms on $\mathcal{G}$ on passing to the quotient by Π_0, an operation which, for $u \in M^!$ and in particular on $M(\omega|0) \subset M^!$, is given by $\varepsilon_2(u)$ (cf. page 594|554). Thus [p. 643]

[p. 625] We see that $M''^!$ maps into the center of $\mathcal{G}/\Pi_0|\mathcal{G}[\Pi_0]$, which is contained in $\mathcal{G}^+/\Pi_0$, and in fact equal to [d2] the image μ of Π/Π_0 in $\mathcal{G}^+/\Pi_0$ (since the center of $\mathcal{G}^+/\Pi \simeq \mathcal{G}_3$ is trivial). Thus we have a factorization

$$M''^! \longrightarrow \mu \underset{\text{centre}}{\hookrightarrow} \mathcal{G}/\Pi_0$$

and we would have to verify that this homomorphism $M''^! \longrightarrow \mu$ is none other than ε_3, which is therefore trivial on $M^{\circ!}$ and a fortiori on $M^{\circ!}(0)$. In fact, we recognize that the kernel is not $\mathrm{Ker}(\varepsilon_3 \mid M''^!)$ [d4] (which in fact|fact contains μ;) but $M_0''^!$ — we will return to this below.[i1] [d5]

140-3-s645-D005 *deletion. Manuscript:* Let us provisionally admit this fact|point, find|let us find then a factorization of

$$N_\rho^* \longrightarrow M\mathcal{G}/\Pi_0$$

as

$$(*) \quad N_\rho^*/M^\circ(-\bar{\jmath}) \longrightarrow \mathcal{G}/\Pi_0$$

and since the composite homomorphism

$$\mathbb{D}_\rho \hookrightarrow N_\rho^*/M^\circ(-\bar{\jmath}) \longrightarrow \mathcal{G}/\Pi_0$$

is injective, we see that the kernel of (*) is a subgroup of $N_\rho^*/M^\circ(-\bar{\jmath})$ whose intersection with $\mathbb{D}_\rho$ is $\{1\}$ — it is therefore 1, or of order 2 (since

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 646]

d1 Admitting this point, we therefore find

$$\mathrm{Ker}(N_\rho^* \longrightarrow \mathcal{G}/\Pi_0) = N_\rho^* \cap M_0''^{!}$$

and since

$$N_\rho^* \cap M_0^! = Z_{\rho 0}^! = M'(-\bar{\jmath}),$$

we find that the kernel sought is equal to:

$$M'(-\bar{\jmath}) \cap M'' = M^\circ(-\bar{\jmath}), \quad \text{cqfd.}$$

Thus d4 we do have an injective homomorphism (46), and since the groups [p. 645]

Apparatus for this scan

140-3-s646-D001 *deletion. Manuscript:* $\mathbb{D}_\rho$ has index 2 in $N_\rho^*/M^\circ(-\bar{\jmath})$). I see more clearly — let us try the Proposition Consider the filtration of $\mathcal{G}^{\wedge|*}/\Pi_0^\wedge$ by $\mathcal{G}/\mathcal{G}^+ \simeq \mu$, $\mathcal{G}^+/\Pi \simeq \mathcal{G}_3$, and $\Pi/\Pi_0 \simeq \mu$. Consider the filtration of M by $M/M'' \xrightarrow[\sim]{\varepsilon_2} \mu$, by $M''/M''^{!} \simeq \mathcal{G}_3$, and $M''^{!}/M^{\circ!} \overset{\varepsilon_3}{\simeq} \mu$. Then the canonical homomorphism

$$M \longrightarrow \mathcal{G}/\Pi_0$$

is compatible with the filtrations, and induces some obvious isomorphisms on the factors. In particular the kernel of $M \longrightarrow \mathcal{G}/\Pi_0$ is $M^{\circ!}$.

Now let

$$(53) \qquad \begin{array}{ccc} & \mathcal{M}^{\natural|\sharp}_{\rho,\sigma} & \subset \quad \mathcal{M}_{\rho,\sigma} \\ & \| \,\mathrm{dfn} & \\ N^{?}_{\rho} \times_{\gamma_{\rho,\sigma}} Z^{!}_{\sigma 0} \times_{\gamma_{\rho,\sigma}} & \underbrace{G_{\rho,\sigma}}_{M} & \end{array}$$

We have a canonical [d1]central embedding[i1]

$$(54) \qquad \mu \times \mu \times \mu \hookrightarrow \mathcal{M}_{\rho,\sigma}$$

$$(\epsilon, \epsilon', \epsilon'') \longmapsto (\epsilon, \epsilon', \epsilon'')$$

coming from the central embeddings [d3]

$$\mu \hookrightarrow N^{*}_{\rho}, \qquad \mu \hookrightarrow N^{*}_{\sigma}, \qquad \mu \hookrightarrow G_{\rho,\sigma}$$

$$\mathcal{G}^{+}_{\rho,\sigma} = \mathcal{G}^{+})$$

and we have

$$\mathcal{M}^{\natural|\sharp}_{\rho,\sigma} \cap (\mu \times \mu \times \mu) = (1 \times \mu \times \mu)$$

hence

$$(55) \qquad \mu \times \mu \hookrightarrow \mathcal{M}^{\natural|\sharp}_{\rho,\sigma}.$$

We denote by μ_ρ the central subgroup μ of N_ρ or of $N^?_\rho$, or $\mu \times 1$ in $\mathcal{M}^{\natural|\sharp}_{\rho,\sigma}$. It is then clear from (52), that we have an exact sequence

$$(55) \qquad 1 \longrightarrow \mu_\rho \hookrightarrow \mathcal{M}^{\natural|\sharp}_{\rho,\sigma} \longrightarrow G_{\rho,\sigma} \longrightarrow 1$$
$$\wr$$
$$M$$

whence canonical homomorphisms|homomorphisms

[scan 649]

[p. 627]

$$(56) \qquad M \xrightarrow{\sim} \mathcal{M}^{\natural|\sharp}_{\rho,\sigma}/\mu_\rho \hookrightarrow \mathcal{M}_{\rho,\sigma}/\mu_\rho.$$

m1318

Marginal note. m1318 We therefore set $\Gamma^{\natural|\sharp}_{\rho,\sigma} \overset{\text{dfn}}{=} \mathcal{M}^{\natural|\sharp}_{\rho,\sigma}/\mathcal{G}^+_{\rho,\sigma} \subset \Gamma_{\rho,\sigma} = \mathcal{M}_{\rho,\sigma}/\mathcal{G}^+_{\rho,\sigma}$.

Obviously the subgroup $\mathcal{M}^{\natural|\sharp}_{\rho,\sigma}$ of $\mathcal{M}_{\rho,\sigma}$ contains $\mathcal{G}_{\rho,\sigma} = SG_{\rho,\sigma} \simeq \mathcal{G}^{+\wedge}$, in fact we have a diagram of exact sequences

$$\begin{array}{ccccccccc} 1 & \longrightarrow & \mu_\rho \times \mathcal{G}_{\rho,\sigma} & \longrightarrow & \mathcal{M}^{\natural|\sharp}_{\rho,\sigma} & \longrightarrow & \gamma_{\rho,\sigma} & \longrightarrow & 1 \\ & & \downarrow & & \downarrow & & \| & & \\ (57) \quad 1 & \to & \underbrace{SZ_\rho}_{L_\rho} \times \underbrace{SZ_\sigma}_{L_\sigma} \times \mathcal{G}^+_{\rho,\sigma} & \to & \mathcal{M}_{\rho,\sigma} & \to & \gamma_{\rho,\sigma}|\Gamma_{\rho,\sigma} & \to & 1 \end{array}$$

In the isomorphism (56), the subgroup $\mathcal{G}^{+\wedge}$ of M corresponds to the subgroup $\mu_\rho \times \mathcal{G}^+_{\rho,\sigma}/\mu_{\sigma|\rho} \simeq \mathcal{G}_{\rho,\sigma}$, it maps isomorphically onto the subgroup $\mathcal{G}_{\rho,\sigma}$ of $\mathcal{M}_{\rho,\sigma}/\mu_\rho$.

d2

We thus find

$$
\begin{array}{ccccccccc}
 & & & & \mathcal{G}^{+}_{\rho,\sigma}|G^{+}_{\rho,\sigma} & & \gamma_{\rho,\sigma} & & \\
 & & & & \wr & & \wr & & \\
1 & \longrightarrow & \mathcal{G}^{+\wedge} & \longrightarrow & M & \longrightarrow & \tilde{\Gamma}_{\mathbb{Q}} & \longrightarrow & 1 \\
 & & \downarrow{\scriptstyle \sim} & & \downarrow{\scriptstyle \sim} & & \wr & & \\
(58)\quad 1 & \longrightarrow & \mathcal{G}^{+}_{\rho,\sigma} & \xrightarrow{\sim} & \mathcal{M}^{\natural|\sharp}_{\rho,\sigma}/\mu_\rho & \longrightarrow & \Gamma^{\natural|\sharp}_{\rho,\sigma}/\mu_\rho & \longrightarrow & 1 \\
 & & \downarrow{\scriptstyle 1} & & \downarrow & & \downarrow & & \\
1 & \longrightarrow & \mathcal{G}^{+}_{\rho,\sigma} & \longrightarrow & \mathcal{M}_{\rho,\sigma}/\mu_\rho & \longrightarrow & \Gamma_{\rho,\sigma}/\mu_\rho & \longrightarrow & 1
\end{array}
$$

Thus, we find in passing that the canonical homomorphism

$$
(59)\quad 1 \longrightarrow \underbrace{SZ_\rho \times SZ_\sigma}_{L_\rho \times L_\sigma} \longrightarrow \Gamma_{\rho,\sigma} \xrightarrow{\text{épi}} \gamma_{\rho,\sigma} \longrightarrow 1
$$

admits a "bisection" $\Gamma_{\rho,\sigma} \xrightarrow{\sim} \gamma_{\rho,\sigma}$ (whose intersection with $SZ_\rho \times SZ_\sigma$ is $\mu_\rho \times 1$)

[p. 628]

VI The general groups $\mathcal{M}_{\rho,\sigma}$: recapitulation, refinement.

1°) Data. These are those of V 1°) (page 577). In addition to $\mathcal{G}$ (profinite)[i1] and to

$$\mathrm{Gl}(2,\mathbb{Z})^{\wedge} \longrightarrow \mathcal{G}$$

a continuous surjective homomorphism, i.e. generators ρ, σ, τ (or ρ, σ, τ') of $\mathcal{G}$, we also give ourselves an open subgroup

$$(1) \qquad \mathcal{G}^{\natural|\sharp}_{0|a} \subset \mathcal{G}^{+}, \quad \text{invariant in } \mathcal{G}^{*|+}.$$

In the universal case $\mathcal{G} = \mathrm{Gl}(2,\mathbb{Z})^{\wedge}$, the datum of $\mathcal{G}^{\natural|\sharp}_{0|a}$ may correspond to the point of view where we look at the subgroups $M^{\natural|\sharp}$ of M [d1]formed|formed of the u which[i2] normalize[d2] $\mathcal{G}^{\natural|\sharp}$ and which operate trivially in $\mathcal{G}^{+}/\mathcal{G}^{\natural|\sharp}$ — this is[i3] [d3] an open subgroup, which defines[i4] in $\tilde{\Gamma}_{\mathbb{Q}} = M/\mathcal{G}^{+}$ an open image subgroup $\tilde{\Gamma}^{\natural|\sharp}_{\mathbb{Q}}$, whose representations in suitable profinite groups we may propose to study. An interesting case will be the one where

$$\mathcal{G}^{\natural|\sharp} = \Pi_0, \quad \text{thus } M^{\natural|\sharp} = M''^{!},$$

or

$$\mathcal{G}^{\natural|\sharp} = \Pi, \quad \text{thus } M^{\natural|\sharp} = M^{!}.$$

If

$$\mathcal{G}^{\natural|\sharp} = \mathcal{G}, \quad \text{thus } M^{\natural|\sharp} = M,$$

we recover the preceding constructions. [d4]

[scan 652]

An interesting case also is the one where $\mathcal{G}$ is the group of adelic integral[i1] points of a group scheme over $\mathbb{Z}$ (in this case, it is true that ρ and σ, τ generate perhaps|not then $\mathcal{G}^{+|*}$ only modulo a finite group i.e. they generate perhaps only an open subgroup. In this case, we should rather paraphrase the constructions that follow in the scheme-theoretic case I shall come back to this later on. An interesting choice of a $\mathcal{G}^{\natural|\sharp}$ is then the identity component of $\mathcal{G}$.

I hesitate to introduce notations $Z^{\natural|\sharp}_{\rho,\sigma}, \mathcal{M}^{\natural|\sharp}_{\rho,\sigma}$ etc — so as not to overload notations that are already heavy. So I prefer to use the simpler notations $Z_{\rho,\sigma}$, etc — it being understood that in these constructions, the group $\mathcal{G}^{\natural|\sharp}$ enters — with the option of reintroducing the notation $\natural|\sharp$ if need be. We put

$$\mathcal{G}^{\natural|\sharp}_{\tau} = \overbrace{\{1,\tau\}}^{\mu_\tau}.\mathcal{G}^{\natural|\sharp} \subset \mathcal{G}. \tag{3}$$

2°) $Z_{\rho,\sigma},\ \gamma_{\rho,\sigma}$.

Let

$$Z_{\rho,\sigma} \subset \mathrm{Aut}(\mathcal{G}^+) \times \widehat{\mathbb{Z}}^* \times \mu \times \mu$$
$$\| \text{ dfn}$$

$$(4) \qquad \left\{ (u,\mu,\varepsilon_2,\varepsilon_3) \;\middle|\; \begin{array}{ll} a) & \exists \alpha \in \mathcal{G}_\tau^{\natural|\sharp},\ \text{with } \varepsilon_{\mathcal{G}}(\alpha)=\varepsilon_3, \quad u(\rho)=\alpha(\rho) \\ b) & \exists \beta \in \mathcal{G}_\tau^{\natural|\sharp},\ \text{with } \varepsilon_{\mathcal{G}}(\beta)=\varepsilon_2, \quad u(\sigma)=\beta(\sigma) \\ c) & u(\varepsilon_0)=\varepsilon_0^{\mu} \\ d) & u \text{ normalizes } \mathcal{G}^{\natural|\sharp} \text{ and induces the identity on } (\mathcal{G}^+/\mathcal{G}^{\natural|\sharp})/\operatorname{Im}\Pi \end{array} \right\}.$$

m1319

Marginal note. m1319 cf. page 635 continuation d2 this condition.

Proposition. $Z_{\rho,\sigma}$ is a subgroup of the product group.

Proof. The conditions c), d) define obviously d5 each i2 subgroup. Given that

$$\tau(\sigma) = -\sigma|\varepsilon,$$

condition b) also means that

$$(5^*) \qquad b') \quad u(\sigma) \text{ is } \mathcal{G}^{\natural|\sharp}\text{-conjugate to : } \sigma^{\varepsilon_2} (= \varepsilon_2 \sigma)$$

and in this form it is clear that condition c') defines a subgroup. I do not think that condition a) by itself defines a subgroup. But if $\mathfrak{g}_{(b)}|G_{(b)}$ d8 denotes the subgroup of the product defined by these conditions d9 b) i4, we have to show that $\mathfrak{g}|G_{(a,b)}$ is a subgroup of the d11 $\mathfrak{g}|G_{(b)}$ — which will prove the proposition. Let $\underline{u}, \underline{u}' \in \mathfrak{g}_{(b)}|G_{(b)}$, corresponding to $(u,\mu,\varepsilon_2,\varepsilon_3)$ and $(u',\mu',\varepsilon_2',\varepsilon_3')$, and to i7 $\alpha, \alpha' \in \mathcal{G}_\tau^{\natural|\sharp}$, so that we have

[scan 654]

$$(6) \qquad u(\rho) = \alpha(\rho), \quad u'(\rho) = \alpha'(\rho), \quad \text{with} \quad \begin{matrix} \varepsilon_{\mathcal{G}}(\alpha) = \varepsilon_3, \\ \alpha_{\mathcal{G}}(\alpha') = \varepsilon_3'. \end{matrix}$$

Let us prove [d1] that $u'u \in \mathfrak{g}_{(a)(b)}|G_{(a,b)}$ — i.e. that it also satisfies (b)|(a). If $\varepsilon_3 = 1$ i.e. $\alpha \in \mathcal{G}^{\natural|\sharp} \subset \mathcal{G}^{+}$, $u'(\alpha)$ is defined and we have

$$\begin{aligned}(u'u)(\rho) &= u'(u(\rho)) = u'(\alpha(\rho)) = u'(\alpha)(u'(\rho)) = u'(\alpha)(\alpha'(\rho)) \\ &= (u'(\alpha)\alpha')(\rho) = \alpha''(\rho),\end{aligned}$$

with

$$(7) \qquad \left.\begin{matrix} \alpha'' = u'(\alpha)\alpha' \in \mathcal{G}_{\tau}^{\natural|\sharp} \\ \varepsilon_{\mathcal{G}}(\alpha'') = \varepsilon_{\mathcal{G}}(\alpha') = \varepsilon_3' = \varepsilon_3\varepsilon_3' \end{matrix}\right| \text{Case } \varepsilon_3 = 1$$

(since $u'(\alpha) \in \mathcal{G}^{\natural|\sharp}$ i.e. $\varepsilon_{\mathcal{G}}(u'(\alpha)) = 1$, and $\varepsilon_3 = 1$.

In this case we win. If $\varepsilon_3 = -1$, we write

$$\alpha = \alpha_0\tau \qquad \alpha_0 \in \mathcal{G}^{\natural|\sharp},$$

and we have

$$u(\rho) = (\alpha_0\tau)(\rho) = \alpha_0(\tau(\rho)) = \alpha_0(\sigma^{-1}(\rho^{-1})) = (\alpha_0\sigma)(\rho^{-1}),$$

where now $\alpha_0\sigma \in \mathcal{G}^+$, hence $u'(\alpha_0\sigma)$ is defined, and we will have

$$(u'u)(\rho) = u'(u(\rho)) = u'(\alpha_0\sigma)(\underbrace{u'(\rho^{-1})}_{\alpha'(\rho^{-1})}) = (u'(\alpha_0\sigma)\alpha')(\rho^{-1})$$

and since

$$\rho^{-1} = \sigma\tau(\rho)$$

we find

$$(8) \qquad (u'u)(\rho) = \alpha''(\rho)$$

with

$$\begin{cases} \alpha'' = \varepsilon \overbrace{u'(\alpha_0)}^{\in \mathcal{G}^{\natural\sharp}} \overbrace{u'(\sigma)}^{\in \mathcal{G}^+} \overbrace{\alpha'}^{\in \mathcal{G}_\tau^{\natural\sharp}} \sigma\tau & \text{where} \\ \varepsilon \in \mu = \{\pm 1\}\hookrightarrow \mid \Rightarrow \operatorname{Centre} \mathcal{G}^+ \end{cases}$$

[d5] is chosen so that α'' (if possible) is in $\mathcal{G}_\tau^{\natural\sharp}$. Let us note that all the factors of this product are in $\mathcal{G}_\tau^{\natural}\mathcal{G}^+ | \mathcal{G}_\tau^{\natural}/\mathcal{G}^+$, in any case $\alpha'' \in \mathcal{G}$.

[scan 655]

[p. 630]

Let us reduce modulo $\mathcal{G}^{\natural|\sharp}$, the relation $\alpha'' \in \mathcal{G}_\tau^{\natural|\sharp}$ reads

$$\dot\alpha'' \in \{1, \dot\tau\} \quad \text{i.e.} \quad \dot\varepsilon\, u'(\sigma)^{\cdot}\dot\alpha'\dot\sigma\dot\tau \in \{1, \dot\tau\} \quad \text{i.e.} \quad \dot\varepsilon\, u'(\sigma)^{\cdot}\dot\alpha'\dot\sigma \in \{1, \dot\tau\}.$$

d1

We distinguish again two cases[i1]

1°) $\varepsilon_3' = 1$ i.e. $\dot\alpha' = 1$ [d2] the relation reads

$$(*) \qquad \dot\varepsilon\, u'(\sigma)^{\cdot}\dot\sigma = 1$$

2°) $\varepsilon_3' = -1$ i.e. $\dot\alpha' = \dot\tau$, since $\tau\sigma = -\sigma\tau$, the relation reads

$$(**) \qquad -\dot\varepsilon\, u'(\sigma)^{\cdot}\dot\sigma = 1,$$

thus in all cases, the relation reads

$$(9) \qquad \begin{cases} u'(\sigma)^{\cdot} = (\varepsilon\varepsilon_3')^{\cdot}\dot\sigma^{-1} & \text{i.e. again} \\ u'(\sigma)^{\cdot} = (-\varepsilon\varepsilon_3')^{\cdot}\dot\sigma \end{cases}$$

Now [d4] suppose now that we have b) for u',[i2] which [d5]implies[i3]

$$u'(\sigma)^{\cdot} = \varepsilon_2'\,\dot\sigma,$$

we see therefore that it suffices to choose ε so that $-\varepsilon\varepsilon_3' = \varepsilon_2'$ i.e.

$$\varepsilon = -\varepsilon_2'\varepsilon_3'$$

thus we will have

$$\alpha'' = -\varepsilon_2'\varepsilon_3'\, u'(\underbrace{\alpha_0\sigma}_{\alpha\tau\sigma=\alpha\tau'})\alpha' \underbrace{\sigma\tau}_{-\tau'}$$

i.e.

$$(10) \qquad \alpha'' = \varepsilon_2'\varepsilon_3'\, u'(\alpha\tau')(\alpha'\tau') \quad \Big| \quad \text{Case } \varepsilon_3 = -1$$

a formula which makes sense, since $\alpha\tau' \in \mathcal{G}^+$ hence $u'(\alpha\tau')$ is defined, and the preceding argument proves that the element in question [d9]satisfies[i6]

$$(11) \qquad \alpha'' \in \mathcal{G}_\tau^{\natural|\sharp}, \quad \varepsilon_{\mathcal{G}}(\alpha'') = \underbrace{\varepsilon_{\mathcal{G}}(\alpha)}_{-1}\,\varepsilon_{\mathcal{G}}(\alpha')$$

by distinguishing cases (*) and (**) of (9). Same conclusion in the first case where $\varepsilon_{\mathcal{G}}(\alpha) = 1$ (7). This completes the proof.[i7]

Remarks [d1]

[d2] If $\mathcal{G}$ is "big enough", the projection homomorphism is injective

(12)

$$Z_{\rho,\sigma} \hookrightarrow \mathrm{Aut}(\mathcal{G}^+)$$

(cf. page 578)

Examples in the universal case

a) $\mathcal{G}^{\natural|\sharp} = \mathcal{G}^+ = \mathrm{Sl}(2,\mathbb{Z})^\wedge$. [d4] Condition|condition (4) d) is empty, conditions a), b) are equivalent respectively to the fact that $u(\rho)$ conjugate to ρ^{ε_3}, $u(\sigma)$ conjugate to σ^{ε_2}, i.e. comes back to definition (6) page 578, which gives

$$(13) \qquad Z_{\rho,\sigma} = M(0).L_0^{\mathcal{G}} = M^{\mathcal{G}}[0] = M[0]$$

m1321

Marginal note. m1321 N.B. A priori we rather have $Z_{\rho,\sigma} \subset \widetilde{M}_{0,3}|M_{0,3}$, but

$$\begin{array}{ccc} M[0] & \xrightarrow{\sim} & \widetilde{M}_{0,3}[0] \\ \| & & \| \\ M(\omega|0).L_0^{\mathcal{G}} & \xrightarrow{\sim} & M_{0,3}(0).L_0^{\mathcal{G}_{0,3}} \end{array}$$

b) $\mathcal{G}^{\natural|\sharp} = \Pi = \Pi_0 \times \mu$. We now find

$$Z_{\rho,\sigma} = M(0).L_0^{\Pi} = M^{\Pi}[0] = M^{!}[0]|M'^{!}[0] \tag{14}$$

(denoted $Z^{!}_{\rho,\sigma}$ in V number° 8).

m1322

Marginal note. m1322 In this case, it is immediate that $Z_{\rho,\sigma}$ operates trivial[ly] even on $\mathcal{G}^{+}/\mathcal{G}_{\tau}^{\natural|\sharp}$, for this is so for the [d6].

m1323

Marginal note. m1323 $M^{!}[0]|M'^{!}[0] = M^{\Pi}[0]$.

m1324

Marginal note. m1324 make explicit again why (i.e. why) that $(\varepsilon_0, 1, 1, 1) \notin Z_{\rho,\sigma}$

c) $\mathcal{G}^{\natural|\sharp} = \Pi_0$. Conditions a) and b) of (4)[i1] have not changed with respect to|with respect to the [d7]preceding case[i2], since $\Pi = \Pi_0 \times \mu$ and μ is central, on the other hand the

[p. 655]

Apparatus for this scan

140-3-s656-D001 *deletion. Manuscript:* a) For condition b) to be multiplicative, we do not need condition a) in all its strength, it suffices that u in $\mathcal{G}^{+}/\mathcal{G}^{\natural|\sharp}$ normalize the image of L_σ, i.e. that we have

[scan 657]

[p. 631]

condition d) becomes distinctly stricter, we find for example that $Z_{\rho,\sigma} \cap \mathcal{G}^+ = L_0^{\Pi_0}$ (of index 2 in the corresponding group L_0^{Π} of the preceding case), and since the operation of $M(0) \subset M^{!}$[i1] on $\mathcal{G}^+/\Pi_0$ is through the character $\varepsilon_2^{*|\#}$, we see that we now have

$$(15) \qquad Z_{\rho,\sigma} = M''(0).L_0^{\Pi_0} = M''[0]_0$$

$$\begin{cases} M''(0) = \mathrm{Ker}(M(0) \xrightarrow{\varepsilon_2} \mu) \\ M''[0]_0 = \mathrm{Ker}(M[0]_0 \xrightarrow{\varepsilon_2} \mu) \\ M[0]_0 = M(\omega|0).L_0^{\Pi_0} \end{cases}$$

m1327

Marginal note. [m1327] This remark about a $\mathcal{G}_0^{\natural|\sharp}$ now becomes useless.

These two latter[i4] examples suggest the advisability, in the general[i5] case where we would have a subgroup [d3] $\mathcal{G}_0^{\natural|\sharp}$ of $\mathcal{G}^{\natural|\sharp}$, invariant in $\mathcal{G}$[i6], such that we have

$$(16) \qquad \mathcal{G}^{\natural|\sharp} = \mathcal{G}_0^{\natural|\sharp} \times \mu$$

(here μ is the universal central subgroup $\mu = \{1, \rho^3\} = \{1, \sigma^2\}$)[i7] of defining $Z_{\rho,\sigma}$ in terms of $\mathcal{G}^{\natural|\sharp}$, and of choosing the α, β of definition (4) in [d5]

$$(17) \qquad \mathcal{G}_{0\tau}^{\natural|\sharp} \overset{\mathrm{dfn}}{=} \mu_\tau.\mathcal{G}_0^{\natural|\sharp}.$$

Remark We are tempted to replace definition (4) (for a) and b))[i8] by the apparently simpler definition of page 578, which makes it evident that we have a subgroup. But they [d6] do not give, even if $\mathcal{G}^{\natural|\sharp} \subset \Pi$ (universal case)[i9] [d7] a trivial action of [d8] Z on $\mathcal{G}^+/\Pi$, as we [d9] see[i11] immediately, [d10i10]

[scan 658]

except by restricting ourselves to some, $(u, \mu, \varepsilon_2, \varepsilon_3)$ with $\varepsilon_3 = 1$, since $\dot\rho^{-1}$ is not equal to $\dot\rho$! It is true [d1] (in the universal case for example) that $u(\rho)$ is conjugate in $\mathcal{G}^+$ to ρ^{ε_3}, but in general it will not be so by an element (say) of Π.

We set

$$(18) \qquad L_0^{\natural|\sharp} = \{l \in L_0^{\mathcal{G}} \mid (\mathrm{int}(l), 1, 1, 1) \in Z_{\rho,\sigma}\}$$

$$\left(\text{where } L_0^{\mathcal{G}} \subset \mathcal{G}^+ \text{ is the set of the } \varepsilon_0^n,\ n \in \widehat{\mathbb{Z}}\right)$$

m1328

Marginal note. [m1328] N.B. We have $L_0^{\natural|\sharp} \supset L_0 \cap \mathcal{G}^{\natural|\sharp}$, and the inclusion can be strict, cf. example c) above…where $L_0^{\natural|\sharp} = L_0^{\Pi}$, $L_0 \cap \mathcal{G}^{\natural|\sharp} = L_0^{\Pi_0}$. which is surprising.

and we have a canonical homomorphism

$$(19) \qquad L_0^{\natural|\sharp} \xrightarrow{\ i\ } Z_{\rho,\sigma},$$

$$l \longmapsto (\mathrm{int}_{\mathcal{G}^+}(l), 1, 1, 1)$$

injective iff we have

$$(20) \qquad L_0^{\natural|\sharp} \cap \mathrm{Centr}(\mathcal{G}^+) = \{1\}$$

the image invariant. We set

$$(21) \qquad \gamma_{\rho,\sigma} = Z_{\rho,\sigma}/L_0^{\natural|\sharp},$$

whence

$$(22) \qquad 1 \longrightarrow L_0^{\natural|\sharp} \longrightarrow Z_{\rho,\sigma} \xrightarrow{\delta_Z} \gamma_{\rho,\sigma} \longrightarrow 1,$$

$$(23) \qquad Z_{\rho,\sigma} \longrightarrow \gamma_{\rho,\sigma} \begin{cases} \xrightarrow{\varepsilon_{3\gamma}} \mu \\ \xrightarrow{\chi_\gamma} \widehat{\mathbb{Z}}^* \\ \xrightarrow{\varepsilon_{2\gamma}} \mu \end{cases}$$

) deduced from the

$$(u, \mu, \varepsilon_2, \varepsilon_3) \begin{cases} \longmapsto \varepsilon_3 \\ \longmapsto \mu \\ \longmapsto \varepsilon_2. \end{cases}$$

140-3-s658-D003 *deletion. Manuscript:* Remarks We denote set,

$$(24) \qquad \begin{cases} \gamma'_{\rho,\sigma} = \mathrm{Ker}\,\varepsilon_{3\gamma}, & \gamma''_{\rho,\sigma} = \mathrm{Ker}\,\varepsilon_{2,\sigma}|\varepsilon_{2\gamma}, & \gamma'''_{\rho,\sigma} = \mathrm{Ker}\,\varepsilon_{2\gamma}\varepsilon_{3\gamma} \\ Z'_{\rho,\sigma} = \dots & Z''_{\rho,\sigma} = \dots & Z'''_{\rho,\sigma} = \dots \end{cases}$$

(inverse images in $Z_{\rho,\sigma}$)

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 659]

[p. 632]

We set

$$(24) \qquad \begin{cases} \gamma'_{\rho,\sigma} = \mathrm{Ker}\,\varepsilon_{3\gamma}, \\ \gamma''_{\rho,\sigma} = \mathrm{Ker}\,\varepsilon_{2\gamma}, \\ \gamma'''_{\rho,\sigma} = \mathrm{Ker}\,\varepsilon_{2\gamma}\varepsilon_{3\gamma},\ \gamma^{\circ}_{\rho,\sigma} = \gamma' \cap \gamma'' = \gamma'' \cap \gamma''' = \gamma''' \cap \gamma' \\ Z'_{\rho,\sigma}, Z''_{\rho,\sigma}, Z'''_{\rho,\sigma}, Z^{\circ}_{\rho,\sigma} \text{ are the inverse images of the } \gamma'_{\rho,\sigma} \text{ etc} \\ \qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad \text{in } Z_{\rho,\sigma} \end{cases}$$

These are thus subgroups of index 1, or 2 or four in $\gamma_{\rho,\sigma}$ resp. $Z_{\rho,\sigma}$ — the index 4 being possible only for $\gamma^{\circ}_{\rho,\sigma}, Z^{\circ}_{\rho,\sigma}$.

Remarks 1) We thus have

$$(25) \qquad Z^{\circ}_{\rho,\sigma} \simeq \left\{ (u,\mu) \in \mathrm{Aut}(\mathcal{G}^+) \times \widehat{\mathbb{Z}}^* \;\middle|\; \begin{array}{ll} \text{a)} & u(\rho) \text{ is } \mathcal{G}^{\natural\sharp}\text{-conjugate to } \rho \\ \text{b)} & u(\sigma) \quad \underline{\qquad\qquad} \quad \sigma \\ \text{c)} & u(\varepsilon_0) = \varepsilon_0^{\mu} \end{array} \right\},$$

m1329

Marginal note. m1329 More generally,

$$Z'''_{\rho,\sigma} \simeq \left\{ (u,\mu,\varepsilon) \in \mathrm{Aut}(\mathcal{G}^+) \times \widehat{\mathbb{Z}}^* \times \mu \;\middle|\; \begin{array}{ll} \text{a)} & u(\rho)\ \mathcal{G}^{\natural\sharp}\text{-conjugate to } \varepsilon[\tau](\rho) \\ \text{b)} & u(\sigma) \text{ is } \mathcal{G}^{\natural\sharp}\text{-conjugate to } \varepsilon[\tau](\sigma) \\ \text{c)} & u(\varepsilon_0) = \varepsilon_0^{\mu} \end{array} \right\},$$

(isomorphism of d3groups). The condition d) of (4) — stability of $\mathcal{G}^{\natural\sharp}$ under u — is a consequence here of a) b) c), for we will have

$$u(\rho) \equiv \rho \quad (\mathcal{G}^{\natural\sharp})$$
$$u(\sigma) \equiv \sigma \quad (\mathcal{G}^{\natural\sharp})$$

which implies

$$(25\text{bis}) \qquad u(x) \equiv x \quad (\mathcal{G}^{\natural\sharp}) \qquad \forall x \in \mathcal{G}^+,$$

i.e. the stability of $\mathcal{G}^{\natural\sharp}$ and a trivial action of u on $\mathcal{G}/\mathcal{G}^{\natural\sharp}$.

2) We also have the remarkable element

$$(26) \qquad \tau_Z \in Z_{\rho,\sigma}, \qquad \tau_Z = (\tau, -1, -1, -1)$$

m1330

Marginal note. m1330 That is one more reason not to require in (4) d) that u operate trivially on $\mathcal{G}^+/\mathcal{G}^{\natural|\sharp}$, which would make me|we would make lose τ !

3°) $S_0G_{\rho,\sigma}, G_{\rho,\sigma}, S_0G^{\natural|\sharp}_{\rho,\sigma}, G^{\natural|\sharp}_{\rho,\sigma}$.

Proceeding as on page 577, we find

$$Z_{\rho,\sigma} \longrightarrow \mathrm{Aut}(\mathcal{G}^+)$$

hence 1/2 direct products

$$(27) \qquad S_0G_{\rho,\sigma} \overset{\text{dfn}}{=} Z_{\rho,\sigma} \,.\, \mathcal{G}^+, \supset S_0G^{\natural|\sharp}_{\rho,\sigma} \overset{\text{dfn}}{=} Z_{\rho,\sigma} \,.\, \mathcal{G}^{\natural|\sharp}$$

and a homomorphism

$$(28) \quad L_0^{\natural|\sharp} \overset{i_{L_0,S_0G}|i_{L_0,G}}{\hookrightarrow} S_0G^{\natural|\sharp}_{\rho,\sigma} \qquad \subset \qquad S_0G_{\rho,\sigma}$$

$$l \longmapsto i_{L_0,Z}(l) \,.\, l^{-1}$$

Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

[scan 662]

central in $Z_0^{\natural\sharp}$. Let us consider the map

$$Z_0^{\natural\sharp} \longrightarrow S_0 G_{\rho,\sigma}^{\natural\sharp} = Z_{\rho,\sigma} \cdot \mathcal{G}^{\natural\sharp}$$

$$(42) \qquad \begin{array}{ccccc} f \mapsto f^{-1} & & \cdot \underline{u}(f) & & = \underline{u}(f) \cdot f^{-1} \quad \text{where } \underline{u}(f) = (\mathrm{int}(f),1,1,1) \in Z_{\rho,\sigma} \\ \cap & & \cap & & \cap \\ \mathcal{G}^{\natural\sharp} & & Z_{\rho,\sigma} & & G_{\rho,\sigma}^{\natural\sharp} \end{array}$$

This map is a homomorphism of groups, d1 it i2 d2 d4 d5 induces on $L_0^{\natural\sharp} \subset Z_0^{\natural\sharp}$ the canonical homomorphism $i_{L_0,SG} | i_{L_0,S_0G}$ (28), and $L_0^{\natural\sharp} \subset Z_0^{\natural\sharp}$ is the inverse image of

$$i_{L_0,SG} | i_{L_0,S_0G}(L_0^{\natural\sharp}) = \mathrm{Ker}(S_0 G_{\rho,\sigma}^{\natural\sharp} \longrightarrow G_{\rho,\sigma}^{\natural\sharp}).$$

We thus find an injective homomorphism

$$(43) \qquad Z_0^{\natural\sharp}/L_0^{\natural\sharp} \hookrightarrow G_{\rho,\sigma}^{\natural\sharp}$$

whose image is the kernel of (38), i.e. we have a canonical exact sequence

$$(44) \qquad \begin{array}{ccccccccc} 1 & \to & L_0^{\natural\sharp} & \to & Z_0^{\natural\sharp} & \to & G_{\rho,\sigma}^{\natural\sharp} & \longrightarrow & \widetilde{G}_{\rho,\sigma}^{\natural\sharp} & \longrightarrow & 1 \\ & & & & & & & & \cap & & \\ & & & & & & & & \mathrm{Aut}(\mathcal{G}^+) \times \widehat{\mathbb{Z}}^* \times \mu \times \mu & & \end{array}$$

where $\widetilde{G}_{\rho,\sigma}^{\natural\sharp}$ consists of the $(u, \mu, \varepsilon_2, \varepsilon_3)$ satisfying the conditions (39).

Remark. This proposition brings out to what extent the d6 construction made here of $G_{\rho,\sigma}^{\natural\sharp}$ is finer than the one where we would define|defined it simply as a group of automorphisms of $\mathcal{G}^+$ (we even have|of them need of the $\mu, \varepsilon, \varepsilon'$ into the bargain…). Scans 663–681

[scan 663]

[p. 634]

We are also going to consider the homomorphism (in fact actually brought into play by (38), even in cases not at all degenerate such as $\mathcal{G}^+ = \mathrm{SL}(2,\widehat{\mathbb{Z}})$)

$$\begin{array}{ccc} G_{\rho,\sigma}^{\natural|\sharp} & \longrightarrow & \mathrm{Aut}(\mathcal{G}^+)\times\mu\times\mu \\ \underline{u} & \longmapsto & (\mathrm{int}(\underline{u})|\mathcal{G}^+, \varepsilon_3(\underline{u}), \varepsilon_2(\underline{u})) \end{array} \tag{45}$$

induced by (38), its image consists of the systems $(u,\varepsilon_3,\varepsilon_2)$ such that

$$\left\{\begin{array}{ll} \text{a)} & u(\rho) \text{ is } \mathcal{G}^{\natural|\sharp}\text{-conjugate to } \varepsilon_3[\tau](\rho) \\ \text{b)} & u(\sigma) \quad \text{---------------------} \quad \varepsilon_2[\tau](\sigma) \\ \text{c)} & u(L_0^{\mathcal{G}}) \text{ is } \mathcal{G}^{\natural|\sharp}\text{-conjugate to } L_0 \\ \text{d)} & u \text{ stabilizes } \mathcal{G}^{\natural|\sharp} \quad (\text{automatic if } \varepsilon_3=\varepsilon_2, \text{ in view of a) b)|in view of c) b)}) \end{array}\right. \tag{46}$$

Its kernel is

$$\left\{ f^{-1}\underline{u} \in G_{\rho,\sigma}^{\natural|\sharp} \;\middle|\; \begin{array}{l} \underline{u}=(u,\mu,1,1)\in Z^\circ_{\rho,\sigma} \\ f\in\mathcal{G}^{\natural|\sharp} \end{array} \text{ such that } u=\mathrm{int}(f)\right\}. \tag{47}$$

To appreciate the structure of the kernel, let

$$\begin{array}{l} SN_0=\mathrm{Norm}_{\mathcal{G}^+}(L_0), \qquad SN_0^{\natural|\sharp}=SN_0\cap\mathcal{G}^{\natural|\sharp} \\ \qquad\qquad = \left\{ f\in\mathcal{G}^{\natural|\sharp} \;\middle|\; \exists\mu\in\widehat{\mathbb{Z}}^* \text{ such that } \underbrace{(\mathrm{int}\, f,\mu,1,1)}_{\in Z_{\rho,\sigma}} \right\} \end{array} \tag{48}$$

and let

$$\begin{array}{l} S\widetilde{N}_0\subset SN_0\times\widehat{\mathbb{Z}}^*, \qquad S\widetilde{N}_0^{\natural|\sharp}|\widetilde{N}_0^{\natural|\sharp}=S\widetilde{N}_0\cap(N_0^{\natural|\sharp}\times\widehat{\mathbb{Z}}^*) \\ \qquad\qquad\qquad\qquad \| \\ \qquad\qquad\qquad\qquad \{(u,\mu)\mid u(\varepsilon_0)=\varepsilon_0^\mu\} \end{array} \tag{49}$$

— thus we have $\widetilde{N}_0^{\natural|\sharp}$

$$\begin{array}{ccccc} S\widetilde{N}_0^{\natural|\sharp} & \xrightarrow{\sim} & SN_0^{\natural|\sharp} & \qquad & \widehat{\mathbb{Z}} \longrightarrow L_0^{\mathcal{G}} \\ & & \text{if} & & \text{is injective.} \\ (u,\mu) & \longmapsto & u & & n\longmapsto\varepsilon_0^n \end{array} \tag{50}$$

idem for $S\widetilde{N}_0$.

We have a canonical injective homomorphism

$$
\begin{aligned}
&S\widetilde{N}_0^{\natural|\sharp} \longrightarrow S_0\widetilde{G}_{\rho,\sigma}^{\natural|\sharp} = Z_{\rho,\sigma}\cdot\mathcal{G}^+ \\
&(f,\mu) \longmapsto f^{-1}\cdot\underbrace{(\mathrm{int}(f),\mu,1,1)}_{u} = u\cdot f^{-1}
\end{aligned}
\tag{51}
$$

4°) $N_\rho, N_\sigma, Z_\rho, Z_\sigma, N_\rho^{\natural|\sharp}, N_\sigma^{\natural|\sharp}, Z_\rho^{\natural|\sharp}, Z_\sigma^{\natural|\sharp}$.

We put

$$(53)\qquad \begin{cases} N_\rho = \{a \in G_{\rho,\sigma} \mid a(\rho) = \rho^{\varepsilon_3},\ \text{where } \varepsilon_3 = \varepsilon_3(a)\} \\ N_\sigma = \{b \in G_{\rho,\sigma} \mid b(\rho) = \rho^{\varepsilon_2},\ \text{where}|\div\ \varepsilon_2 = \varepsilon_2(b)\} \end{cases}$$

N.B. There is no need after all to drag along|drag along $*$'s by giving a definition of the N_ρ, N_σ which would give bigger groups. (On page 580, 580' I got myself tangled up[d1] on this subject...)

We put

$$(54)\qquad \begin{cases} Z_\rho = \mathrm{Cent}_{G_{\rho,\sigma}}(\rho) = \mathrm{Cent}_{G_{\rho,\sigma}}(L_\rho) = \mathrm{Ker}(N_\rho \xrightarrow{\varepsilon_3} \mu). \\ Z_\sigma = \mathrm{Cent}_{G_{\rho,\sigma}}(\sigma) = \mathrm{Cent}_{G_{\rho,\sigma}}(L_\sigma) = \mathrm{Ker}(N_\sigma \xrightarrow{\varepsilon_2} \mu) \end{cases}$$

$$(55)\qquad \begin{cases} SZ_\rho = Z_\rho \cap \mathcal{G}^+ = \mathrm{Ker}(Z_\rho \xrightarrow{\delta_Z} \gamma_{\rho,\sigma}) \\ \qquad = \mathrm{Cent}_{\mathcal{G}^+}(\rho) = \mathrm{Cent}_{\mathcal{G}^+}(L_\rho) \\ SZ_\sigma = Z_\sigma \cap \mathcal{G}^+ = \mathrm{Ker}(Z_\sigma \xrightarrow{\delta_{Z|z}} \gamma_{\rho,\sigma}) \\ \qquad = \mathrm{Cent}_{\mathcal{G}^+}(\sigma) = \mathrm{Cent}_{\mathcal{G}^+}(L_\sigma) \end{cases},$$

m1336

Marginal note. m1336 we define in the same way SN_ρ, SN_σ, but $SN_\rho = SZ_\rho$, $SN_\sigma = SZ_\sigma$.

whence

$$(56)\qquad \begin{array}{ccccccccc} 1 & \longrightarrow & Z_\rho & \longrightarrow & N_\rho & \xrightarrow{\varepsilon_{3\rho}} & \mu & \longrightarrow & \\ 1 & \longrightarrow & Z_\sigma & \longrightarrow & N_\sigma & \xrightarrow{\varepsilon_{2\sigma}} & \mu & \longrightarrow & 1 \end{array}$$

m1337

Marginal note. m1337 Exact sequences semidirect by $\mu_{\tau'}$ — the last also semidirect by μ_τ.

(The fact that we can put 1's at the end comes from the fact that $\tau' \in N_\rho \cap N_\sigma$ satisfies

$$(57)\qquad \varepsilon_2(\tau') = \varepsilon_3(\tau') = \chi(\tau') = -1.$$

We have a marvelous diagram (page 580'). 664

I would now like to define the analogue of the sub[i2]groups $M|\mathcal{M}(\frac{1}{2})$, $M|\mathcal{M}'(-\bar{j})$, $M|\mathcal{M}'''(-\bar{j})|M|\mathcal{M}''(-\bar{j})$,[i3] N_ρ ? on page 615 ff, which implies that we have a group $\subset G_{\rho,\sigma}^{\natural|\sharp}$ playing the role of $M|\mathcal{M}_0^!$ — the ideal would be for it to be $G_{\rho,\sigma}^{\natural|\sharp}$ itself. But in the universal case $\mathcal{G}^+ = \mathrm{SL}|\mathrm{GL}(2,\mathbb{Z})^\wedge$, $\mathcal{G}^{\natural|\sharp} = \Pi_0$, hence $Z_{\rho,\sigma} = M|\mathcal{M}[0]^! = M|\mathcal{M}(0|\infty).L_0^\pi$, $L_0^{\natural|\sharp} = L_0^{\pi}$[i4] (we find $G_{\rho,\sigma} \simeq M|\mathcal{M}$, [d2] $G_{\rho,\sigma}^{\natural|\sharp}$ = subgroup of $G_{\rho,\sigma} = M|\mathcal{M}$ generated by $\mathcal{G}^{\natural|\sharp} = \Pi_0$ and by $Z_{\rho,\sigma} = M|\mathcal{M}(0|\infty)L_0^\pi = M|\mathcal{M}(0|\infty).\Pi = M|\mathcal{M}^!$, and not $M|\mathcal{M}(0|\infty).\Pi_0 = M|\mathcal{M}_0^!$[d3]

The trouble comes ultimately from the fact that it is $Z_{\rho,\sigma}$ that is too big, we would like to define in $Z_{\rho,\sigma}$ a subgroup playing the role of $M|\mathcal{M}(0|\infty).\Pi_0$. There is no difficulty if we can define in [d4] $Z_{\rho,\sigma}$ a subgroup which corresponds :|to $M|\mathcal{M}(0|\infty)$

$$Z_{\rho,\sigma}(0) \subset Z_{\rho,\sigma} \tag{65}$$

which gives a splitting

$$Z_{\rho,\sigma} \simeq Z_{\rho,\sigma}(0|\infty).L_0^{\natural|\sharp} \qquad (\tfrac{1}{2} \text{ direct}) \tag{66}$$

and we [d5]will have[i5] then

$$G_{\rho,\sigma} \simeq Z_{\rho,\sigma}(0).\mathcal{G}^+, \qquad (\tfrac{1}{2} \text{ direct}) \tag{67}$$

667

splitting of the second|second[i1] exact sequence defines by inverse image one of the first, [d1] But in the typical[i2] cases which us, $L_0^{\natural|\sharp}$ (which is not small enough to give "the right" [d2] $G_{\rho,\sigma}^{\natural|\sharp}$!) is not big enough on the other hand to give an isomorphism in (71) ! But [d3] we can also make an additional hypothesis — namely that the inverse image under (70) of [d4]"right|right"[i3] section

$$T'_0 = \left\{ \begin{pmatrix} \mu & 0 \\ 0 & 1 \end{pmatrix} \;\middle|\; \mu \in \widehat{\mathbb{Z}}^* \right\} \subset B'_0 \quad — \tag{73}$$

which is a subgroup

$$\begin{array}{c} Z_{\rho,\sigma}(0|\infty) \subset Z_{\rho,\sigma} \\ \| \\ \left\{ u \in Z_{\rho,\sigma} \;\middle|\; \text{its image } \begin{pmatrix} \mu & \lambda \\ 0 & 1 \end{pmatrix} \text{ is in } T'_0, \text{ i.e. } \lambda = 0 \right\} \end{array} \tag{74}$$

satisfying

$$Z_{\rho,\sigma}(0|\infty) \cap L_0^{\mu|\natural} = \{1\} \quad .) \tag{75}$$

be in fact a section subgroup, i.e. that $Z_{\rho,\sigma}(0|\infty) \hookrightarrow \gamma_{\rho,\sigma}$ be an epimorphism i.e. an isomorphism, i.e. that we do have

$$Z_{\rho,\sigma} = Z_{\rho,\sigma}(0|\infty).L_0^{\natural|\sharp}. \tag{76}$$

I have good reasons to think that (as soon as (69) exists) this condition is satisfied in all really useful cases. [d6] This|The choice of a 669

[p. 638]

$Z_{\rho,\sigma}(0|\infty)$ has moreover the good property of being "functorial" in an obvious sense (cf. below the questions of functoriality), which will be essential for having a good formalism. This thus allows us to define a subgroup $(G^{\natural|\sharp}_{\rho,\sigma})_0 \subset G^{\natural|\sharp}_{\rho,\sigma}$ i1 by (68). If its definition were not thus a little too convoluted, it is d1 group "finer"i3 that would bei2 better|better, and would in fact deserve the simpler notation $G^{\natural|\sharp}_{\rho,\sigma}$.

Another way of proceeding ! d2We look for ai4 d3 system of|of the adequate restrictions d4 the definition of $Z_{\rho,\sigma}$, which d5 imply that $L_0^{\natural|\sharp} = L_0 \cap \mathcal{G}^{\natural|\sharp}$, i.e. thati5 for $l \in L_0\, a$, we have

$$(\mathrm{int}(l), 1, 1, 1) \in Z_{\rho,\sigma} \iff l \in \mathcal{G}^{\natural|\sharp}$$

But in the universal case, with $\mathcal{G}^{\natural|\sharp} = \Pi_0$, taking $l = l_0$, its image in $\mathcal{G}^{+|*}/\mathcal{G}^{\natural|\sharp} = \mathcal{G}/\Pi_0$ is the nontrivial central element of $\mathcal{G}/\Pi_0$, the inner automorphism it defines in $\mathcal{G}^+/\Pi_0$ (and even|= in $\mathcal{G}/\Pi_0$) is trivial — so it is not through d6 properties of this action that we will manage to exorcise it !

But perhaps it is premature to try already to "cut out" these groups $G^{\natural|\sharp}_{\rho,\sigma}$, $M|\mathcal{M}^{\natural|\sharp}_{\rho,\sigma}$ 670

$$S_0\Gamma_{\rho,\sigma} \simeq \Gamma_{\rho,\sigma} \times_{\gamma_{\rho,\sigma}} Z_{\rho,\sigma} \tag{86}$$

$$\begin{cases} S_0\mathcal{M}_{\rho,\sigma} \simeq \mathcal{M}_{\rho,\sigma} \times_{\Gamma_{\rho,\sigma}} S_0\Gamma_{\rho,\sigma} \\ S_0\mathcal{M}^{\natural|\sharp}_{\rho,\sigma} \simeq \mathcal{M}^{\natural|\sharp}_{\rho|2,\sigma} \times_{\Gamma_{\rho,\sigma}} S_0\Gamma_{\rho,\sigma}. \end{cases} \tag{87}$$

Remark|Remark This deluge of groups makes one a little seasick. I am not sure that the variants S_0 ($S_0\mathcal{M}$, $S_0\mathcal{M}^{\natural|\sharp}$, $S_0\Gamma$) are very useful.

There remains the competition|comparison between invariants with or without $\natural|\sharp$, especially [d2] in $\mathcal{M}_{\rho,\sigma}$ and $\mathcal{M}^{\natural|\sharp}_{\rho,\sigma}$ — whose "difference" is "the m|$\overline{\text{m}}$" as between $\mathcal{G}^+$ and $\mathcal{G}^{\natural|\sharp}$, or [d3] and between[i1] $G_{\rho,\sigma}$ and $G^{\natural|\sharp}_{\rho,\sigma}$, to be precise $\mathcal{M}_{\rho,\sigma}$ is normal in $\mathcal{M}^{\natural|\sharp}_{\rho,\sigma}$, and $G^{\natural|\sharp}_{\rho,\sigma}$ in $G_{\rho,\sigma}$, we have isomorphisms

$$\mathcal{G}^+/\mathcal{G}^{\natural|\sharp} \xrightarrow{\sim} G_{\rho,\sigma}/G^{\natural|\sharp}_{\rho,\sigma} \xrightarrow{\sim} \mathcal{M}_{\rho,\sigma}/\mathcal{M}^{\natural|\sharp}_{\rho,\sigma}. \tag{88}$$

The groups $G_{\rho,\sigma}, \mathcal{M}_{\rho,\sigma}$ play with respect to|vis-à-vis $G^{\natural|\sharp}_{\rho,\sigma}, \mathcal{M}^{\natural|\sharp}_{\rho,\sigma}$ the role of catchalls (in particular to allow us to consider the automorphisms ρ, σ of $G^{\natural|\sharp}_{\rho,\sigma}, \mathcal{M}^{\natural|\sharp}_{\rho,\sigma}$ as induced by inner automorphisms of the 673

surrounding groups $G_{\rho,\sigma}, \mathcal{M}_{\rho,\sigma}$.

We have an element

$$\begin{array}{ccccc} & & \tau'_{M|\mu} \in \mathcal{M}^{\natural|\sharp}_{\rho,\sigma} & & \text{over } \tau'_\gamma \in \gamma_{\rho,\sigma} \\ & & \| & & \\ & (\tau'_\rho, & \tau'_\sigma, & \tau'_G) & \\ (89) & \cup & \cup & \cup & \\ & N^{\natural|\sharp}_\rho & N^{\natural|\sharp}_{\rho|\sigma} & G^{\natural|\sharp}_{\rho,\sigma} & \end{array}$$

whence [d3] canonical embeddings

(90)
$$\begin{array}{ccc} \mathcal{G}_\tau^{\natural|\sharp} & \hookrightarrow & \mathcal{M}_{\rho,\sigma}^{\natural|\sharp} \\ \downarrow & & \downarrow \\ \mathcal{G} & \hookrightarrow & \mathcal{M}_{\rho,\sigma} \end{array}$$

$\mathcal{G}^{\natural|\sharp}$ = inverse image in $\mathcal{M}_{\rho,\sigma}$ of $\{1, \tau_\gamma | \tau'_\gamma\} \subset \gamma_{\rho,\sigma}$

$\mathcal{G}$ = inverse image in $\mathcal{M}_{\rho,\sigma}$ of $\{1, \tau_\gamma\} \subset \gamma_{\rho,\sigma}$

We can reproduce the messy diagrams of page 584, with $\natural|\sharp$'s in the key signature…

I am going to see if I can in fact dispense with redeveloping the links with $\overline{Z}_{\rho,\sigma}$, $SG_{\rho,\sigma}$ etc — even if it means coming back to it later if need be. 674

6°) Functorialities.
m1350

Marginal note. [m1350] N.B. Up to now (in 1° to 5°)[i1] we had not used the hypothesis that ρ, σ generate $\mathcal{G}^+$

Cf. p. 588. In addition to the surjective homomorphism

$$\mathcal{G} \xrightarrow{\varphi} \mathcal{G}' \tag{91}$$

m1351

Marginal note. [m1351] It is better to write

$$\mathcal{G}_0 \to \mathcal{G}$$

cf. p. 643′ ff…

we assume that φ maps $\mathcal{G}^{\natural|\sharp}$ into $\mathcal{G}'^{\natural|\sharp}$.

[d1] Here we denote by[i2] $Z_{\rho,\sigma}, \mathcal{M}_{\rho,\sigma}$ etc. the invariants associated with $\mathcal{G}$, $Z_{\rho',\sigma'}$ etc. those of $\mathcal{G}'$. We have equivalent conditions as in loc. cit. — where we are going to drop the consideration of $\overline{Z}_{\rho,\sigma}^{\mathcal{G}}$… — which mean that for $\forall$

$$\underline{u} = (u, \mu, \varepsilon_2, \varepsilon_3) \in Z_{\rho,\sigma}$$

there exists an automorphism u' of $\mathcal{G}'$ making commutative

$$(92)\qquad \begin{array}{ccc} \mathcal{G}^{+} & \xrightarrow{\varphi} & \mathcal{G}'^{+} \\ {\scriptstyle u}\downarrow & & \downarrow{\scriptstyle u'} \\ \mathcal{G}^{++} & \xrightarrow{\varphi'} & \mathcal{G}'^{+} \end{array}$$

which u' will be unique. It amounts to the =|same to say that the $u \in \mathrm{Aut}(\mathcal{G}^{+})$ which come from $Z_{\rho,\sigma}$, i.e. which normalize L_0, and which transform $\xi_\rho|\ell_\rho, \xi_\sigma|\ell_\sigma$ into d2d3i3 d4 elements $\mathcal{G}_\tau^{\natural|\sharp}$-conjugate to ρ, σ, stabilize the kernel of φ (91).

We then find 675

d1 [p. 642]
m1355

Marginal note. m1355 7°) The subgroups $\mathcal{M}_{\rho,\sigma}[0|\rho]$, $\mathcal{M}_{\rho,\sigma}(\rho)$, $\mathcal{M}_{\rho,\sigma}(\sigma)$.

In the group d5

$$\begin{aligned} S_0\mathcal{M}^{\natural|\sharp}_{\rho,\sigma} &= Z_{\rho,\sigma} \times_{\gamma_{\rho,\sigma}} N^{\natural|\sharp}_{\rho} \times_{\gamma_{\rho,\sigma}} N^{\natural|\sharp}_{\sigma} \times_{\gamma_{\rho,\sigma}} G^{\natural|\sharp}_{\rho,\sigma} \\ &= \left\{ x = (u,a,b,U) \in Z_{\rho,\sigma} \times N_\rho \times N_\sigma \times G_{\rho,\sigma} \;\middle|\; \delta_Z(u) = \delta_\rho(a) = \delta_\sigma(b) = \delta_G(U) \right\} \end{aligned} \tag{100}$$

we introduce three subgroups

$$\begin{cases} S_0\mathcal{M}_{\rho,\sigma}[0] \subset \;| = S_0\mathcal{M}^{\natural|\sharp}_{\rho,\sigma} & \text{by the condition} & U = i_Z(u) \\ S_0\mathcal{M}_{\rho,\sigma}[\rho] \subset S_0\mathcal{M}^{\natural|\sharp}_{\rho,\sigma} & \text{———} & U = i_\rho(a) \\ S_0\mathcal{M}_{\rho,\sigma}[\sigma] \subset S_0\mathcal{M}^{\natural|\sharp}_{\rho,\sigma} & \text{———} & U = i_\sigma(b) \end{cases} \tag{101}$$

now using the three canonical homomorphisms

$$\begin{cases} i_Z : Z_{\rho,\sigma} \hookrightarrow G_{\rho,\sigma} \\ i_\rho : N_\rho \hookrightarrow G_{\rho,\sigma} \\ i_\sigma : N_\sigma \hookrightarrow G_{\rho,\sigma} \end{cases} . \tag{102}$$

These three groups are manifestly all three isomorphic: $Z_{\rho,\sigma} \times_{\gamma_{\rho,\sigma}} N^{\natural|\sharp}_{\rho} \times_{\gamma_{\rho,\sigma}} N^{\natural|\sharp}_{\sigma} = S_0\Gamma_{\rho,\sigma}$, to be precise, in the exact sequence (52)

$$1 \longrightarrow \mathcal{G}^+ \longrightarrow S_0\mathcal{M}_{\rho,\sigma} \longrightarrow S_0\Gamma_{\rho,\sigma} \longrightarrow 1$$

the canonical homomorphism $S_0\mathcal{M}_{\rho,\sigma} \longrightarrow S_0\Gamma_{\rho,\sigma}$ induces isomorphisms between the groups (68) and $S_0\Gamma_{\rho,\sigma}$, the three groups are therefore section subgroups.

We define $\mathcal{M}_{\rho,\sigma}[0]$, $\mathcal{M}_{\rho,\sigma}(\rho)$ (or $\mathcal{M}_{\rho,\sigma}(\frac{1}{2})$)i1 and $\mathcal{M}_{\rho,\sigma}(\sigma)$ (or $\mathcal{M}_{\rho,\sigma}(-\bar{j})$) as the images of $S_0\mathcal{M}_{\rho,\sigma}[0]$, $S_0\mathcal{M}_{\rho,\sigma}[\rho]$ and $S_0\mathcal{M}_{\rho,\sigma}[\sigma]$ under the canonical homomorphism $S_0\mathcal{M}_{\rho,\sigma} \longrightarrow \mathcal{M}_{\rho,\sigma}$, which 678

amounts to setting

$$\begin{cases} \mathcal{M}_{\rho,\sigma}[0] = \{(a,b,U) \in \mathcal{M}_{\rho,\sigma}^{\natural|\sharp} \mid U \in Z_{\rho,\sigma}\} \\ \mathcal{M}_{\rho,\sigma}(\rho) = \{(a,b,U) \in \mathcal{M}_{\rho,\sigma}^{\natural|\sharp} \mid U = a\} \\ \mathcal{M}_{\rho,\sigma}(\sigma) = \{(a,b,U) \in \mathcal{M}_{\rho,\sigma}^{\natural|\sharp} \mid U = b\}. \end{cases} \tag{103}$$

Thus the subgroups|subgroups $\mathcal{M}_{\rho,\sigma}(\rho), \mathcal{M}_{\rho,\sigma}(\sigma)$ of $\mathcal{M}_{\rho,\sigma}^{\natural|\sharp}$ are section groups over $\Gamma_{\rho,\sigma}^{\natural|\sharp} \simeq N_\rho^{\natural|\sharp} \times_{\gamma_{\rho,\sigma}} N_\sigma^{\natural|\sharp}$, hence

$$\begin{cases} \mathcal{M}_{\rho,\sigma}^{\natural|\sharp} \simeq \mathcal{M}_{\rho,\sigma}(\rho) \,.\, \mathcal{G}^{\natural|\sharp} \\ \mathcal{M}_{\rho,\sigma}^{\natural|\sharp} \simeq \mathcal{M}_{\rho,\sigma}(\sigma) \,.\, \mathcal{G}^{\natural|\sharp} \end{cases} \quad (\tfrac{1}{2} \text{ direct}), \tag{104}$$

and likewise|=

$$\begin{cases} \mathcal{M}_{\rho,\sigma} \simeq \mathcal{M}_{\rho,\sigma}(\rho) \,.\, \mathcal{G}^{+} \\ \mathcal{M}_{\rho,\sigma} \simeq \mathcal{M}_{\rho,\sigma}(\sigma) \,.\, \mathcal{G}^{+} \end{cases} \quad (\tfrac{1}{2} \text{ direct}). \tag{105}$$

On the other hand, we will have

$$\begin{array}{ccccccccc} 1 & \longrightarrow|- & L_0^{\natural|\sharp} & - & \mathcal{M}_{\rho,\sigma}[0] & \longrightarrow & \Gamma_{\rho,\sigma} & - & 1 \\ & & \downarrow 1 & & \uparrow \sim & & \uparrow 1 & & \\ & & & & S_0\mathcal{M}_{\rho,\sigma}[0] & & & & \\ & & \downarrow \sim & & & & & & \\ 1 & - & L_0^{\natural|\sharp} & \longrightarrow & S_0\Gamma_{\rho,\sigma} & \longrightarrow|- & \Gamma_{\rho,\sigma} & - & 1 \end{array} \quad , \tag{106}$$

so the extension $\mathcal{M}_{\rho,\sigma}[0]$ of $\Gamma_{\rho,\sigma}$ by $L_0^{\natural|\sharp}$ is identified with the extension $S_0\Gamma_{\rho,\sigma}$ of $\Gamma_{\rho,\sigma}$ by $L_0^{\natural|\sharp}$, i.e. with the inverse image of the extension $Z_{\rho,\sigma}$ of $\gamma_{\rho,\sigma}$ by $L_0^{\natural|\sharp}$, via the canonical homomorphism 679

140-3-s680-D001 *deletion. Manuscript:* $\natural|\sharp$
Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

[scan 681]

[p. 643]

$$\Gamma_{\rho,\sigma} = N_\rho^{\natural|\sharp} \times_{\gamma_{\rho,\sigma}} N_\sigma^{\natural|\sharp} \longrightarrow \gamma_{\rho,\sigma}. \tag{107}$$

Thus giving a section of $Z_{\rho,\sigma}$ over $\gamma_{\rho,\sigma}$ (cf. on this subject p. 636′ ff). defines one of $S_0\Gamma_{\rho,\sigma}$ over $\Gamma_{\rho,\sigma}$, hence of $\mathcal{M}_{\rho,\sigma}[0]$ over $\Gamma_{\rho,\sigma}$. When such a section is fixed, we denote this section group by

$$\mathcal{M}_{\rho,\sigma}(0|\infty) \subset \mathcal{M}_{\rho,\sigma}^{\natural|\sharp},$$

so we will have

$$\begin{cases} \mathcal{M}_{\rho,\sigma}[0] \simeq \mathcal{M}_{\rho,\sigma}(0|\infty) \,.\, L_0^{\natural|\sharp} \\ \mathcal{M}_{\rho,\sigma}^{\natural|\sharp}. \simeq \mathcal{M}_{\rho,\sigma}(0|\infty) \,.\, \mathcal{G}^{\natural|\sharp} \\ \mathcal{M}_{\rho,\sigma} \simeq \mathcal{M}_{\rho,\sigma}(0) \,.\, \mathcal{G} \end{cases} \tag{108}$$

Scans 682–696

[scan 682]

8°) Return to the universal case, and the homomorphism

$$M^{\natural|\sharp} \longrightarrow M_{\rho,\sigma}^{\natural|\sharp}/\mu_\rho$$

We now suppose that $\mathcal{G}$ corresponds to the universal case $\mathrm{GL}(2,\mathbb{Z})^\wedge$, with an arbitrary $\mathcal{G}^{\natural|\sharp}$. We shall denote the universal case by a subscript 0: $\mathcal{G}_0$, $\mathcal{G}_0^+$, $\mathcal{G}_0^{\natural|\sharp}$ etc., and $\mathcal{G}'$, $\mathcal{G}'^{\natural|\sharp}$ etc. the|the former $\mathcal{G}$, $\mathcal{G}^{\natural|\sharp}$ etc.

↙ Z_{ρ_0,σ_0} etc ...
We shall write $\mathcal{G}_0^+$ instead of $\mathcal{G}_0^{+\wedge}$ ...

I set

$$\left\{ u \in M \;\middle|\; \begin{array}{ll} \text{a) } u(\rho) \text{ is } \mathcal{G}^{\natural|\sharp}\text{-conjugate to} & \varepsilon_3[\tau](\rho) \\ \text{b) } u(\sigma) \quad \text{——————} & \varepsilon_2[\tau](\sigma) \\ \text{c) } u(\varepsilon_0) \quad \text{——————} & \varepsilon_0^\mu \\ \text{d) } u \text{ stabilizes } M^{\natural|\sharp} & \end{array} \right\}$$

(107) $M^{\natural|\sharp} \subset M$ (‖)

N.B. $M^{\natural|\sharp} \supset$ | $\ni \mu$

where of course

$$\mu = \chi(u), \quad \varepsilon_2 = \varepsilon_2(u) = \varepsilon_2(\mu), \quad \varepsilon_3 = \varepsilon_3(u) = \varepsilon_3(\mu).$$

I say that $M^{\natural|\sharp}$ is a subgroup of M. We can see this by going back over the calculations on page 629 and following. I prefer to proceed as follows.

681

[scan 683]

[p. 644]

We have seen that we have

$$(108) \qquad Z_{\rho_0,\sigma_0} \hookrightarrow M[0] = M(0) \cdot L_0^{\mathcal{G}} \simeq \widetilde{M}_{0,3}[0] = \widetilde{M}_{0,3}(0) \cdot L_0^{\mathcal{G}_{0,3}}$$

an inclusion which is an equality if $\mathcal{G}_0^{\natural|\sharp} = \mathcal{G}_0^+$, and which identifies $Z_{\rho,\sigma}$ with

$$M^!{}[0] \simeq M(0) \cdot L_0^\pi \quad \text{if} \quad \mathcal{G}_0^{\natural|\sharp} = \pi := \Pi_0.$$

[— in fact, if $\mathcal{G}_0^{\natural|\sharp} \subset \Pi_0$, then we find

$$(109) \quad Z_{\rho,\sigma} = \left\{ u = \underset{\cap}{u_0} \cdot \underset{\cap}{\ell} \;\middle|\; \begin{array}{l} \text{a) } u(\rho) = \alpha(\rho) \quad \text{with } \alpha \in \mathcal{G}_{\bar\tau}^{\natural|\sharp} \\ \text{b) } u(\sigma) = \beta(\sigma) \quad \text{with } \beta \in \mathcal{G}_{\bar\tau}^{\natural|\sharp} \\ \text{d) } u\varepsilon| \in \text{stabilizes } \mathcal{G}_0^{\natural|\sharp} \end{array} \right\}$$
$$\underset{M(0)}{\cap} \quad \underset{L_0^\pi}{\cap}$$

m1364

Marginal note. m1364 this explicit description does not seem to be of any use.

and we see that α, β in a) b) are determined by $u = u_0\ell$ uniquely (d3 even if we|we suppose only $u \in M^!{}[0]$ and no more, and that we require i2 d4 $\alpha, \beta \in \Pi_{0\bar\tau}$, d5 We know that this is a subgroup|subgroup of $\mathrm{Aut}(\mathcal{G}_0^+) \times \widehat{\mathbb{Z}}^* \times \mu \times \mu$ — and in fact, of $\mathrm{Aut}(\mathcal{G}_0^+)$ i3 (proposition page 629). d6

As this group operates on d7 $\mathcal{G}$ via $\widetilde{M}_{0,3}$, = via $\widetilde{M}_{0,3}^!{}[0]$ i4 it maps into $\widetilde{M}_{0,3}^!{}[0]$ by a homomorphism of groups, hence into d8 $M[0]^! \simeq \widetilde{M}_{0,3}[0]$ by a homomorphism of groups.] 682

[scan 684]

d1 Let us consider the system

$$(110)\quad (\mathcal{G}_0^{+\wedge}, Z_{\rho_0,\sigma_0},\quad L_0^{\natural|\sharp} \subset Z_{\rho_0,\sigma_0},\quad Z_{\rho_0,\sigma_0} \longrightarrow \mathrm{Aut}(\mathcal{G}_0^{+\wedge}),\quad L_0^{\natural|\sharp} \hookrightarrow \mathcal{G}_0^{+\wedge})$$

(cf. "digression" below 9°) which gives rise to

$$(110')\qquad G_{\rho_0,\sigma_0},\quad \mathcal{G}_0^{+\wedge} \subset G_{\rho_0,\sigma_0},\quad Z_{\rho_0,\sigma_0} \hookrightarrow G_{\rho_0,\sigma_0},$$

and let us consider the system analogous to (110^*)[i2]

$$(111^{*|\sharp})\quad (\mathcal{G}_0^{+}, \underset{\|}{M[0]^{!|\natural}},\quad \underset{\text{(generated by } \varepsilon_0)}{L_0^{\mathcal{G}}} \subset M[0]^{!|\natural},\quad \dagger^{!|\natural} \longrightarrow \mathrm{Aut}(\mathcal{G}_0^{+}),\quad L_0^{\mathcal{G}} \hookrightarrow \mathcal{G}_0^{+})$$
$$M(0)\cdot L_0^{\pi}$$

which gives rise (loc. cit (9°)) to the situation

$$(111')\qquad (M,\quad \mathcal{G}_0^{+} \subset M,\quad M[0]' \hookrightarrow \mathcal{G}_0^{+}).$$

Now thanks to (108), we have a homomorphism from (110|109|119) into (111), corresponding to the identity on $\mathcal{G}_0^{+}$, (108) on Z_{ρ_0,σ_0}, the canonical inclusion : d3 $L_0^{\natural|\sharp} \subset L_0^{\mathcal{G}}$. This yields a homomorphism from (110′) into (111′), in particular a canonical homomorphism of exact sequences 683

Apparatus for this scan

140-3-s684-D001 *deletion. Manuscript:* The homomorphism

[scan 685]

[p. 645]

(112)

$$\begin{array}{ccccccccc} 1 & \longrightarrow & \mathcal{G}_0^+ & \longrightarrow & G_{\rho_0,\sigma_0} & \longrightarrow & \gamma_{\rho_0,\sigma_0} & \longrightarrow & 1 \\ & & \downarrow{\scriptstyle 1} & & \downarrow & & \downarrow & & \\ 1 & \longrightarrow & \mathcal{G}_0^+ & \longrightarrow & M & \longrightarrow & \tilde{\Gamma}_{\mathbb{Q}} & \longrightarrow & 1 \end{array}$$

where

$$\begin{array}{ccc} \gamma_{\rho_0,\sigma_0} & \longrightarrow & \tilde{\Gamma}_{\mathbb{Q}} \\ \wr & & \wr \\ Z_{\rho_0,\sigma_0}/L_0^{\mu} & & M[0]/L_0^{\mathcal{G}} \end{array}$$

is the one[i1] induced by (108), and is identified with:

$$(113) \qquad Z_{\rho_0,\sigma_0}/L_0^{\natural|\sharp} \longrightarrow M[0]/L_0^{\mathcal{G}}$$

By the very definition of $L_0^{\natural|\sharp}$ as being $Z_{\rho_0,\sigma_0} \cap \mathcal{G}_0^+$ [d1], we see that (113) is injective hence $G_{\rho_0,\sigma_0} \longrightarrow M$ is always injective (it is an isomorphism if $\mathcal{G}_0^{\natural|\sharp} \supset \Pi_0$ ...). We deduce by comparison from (112) a homomorphism of exact sequences

(114)

$$\begin{array}{ccccccccc} 1 & \longrightarrow & \mathcal{G}_0^{\natural|\sharp} & \longrightarrow & G_{\rho_0,\sigma_0}^{\natural|\sharp} & \longrightarrow & \gamma_{\rho_0,\sigma_0} & \longrightarrow & 1 \\ & & \downarrow & & \downarrow & & \downarrow & & \\ 1 & \longrightarrow & \mathcal{G}_0^+ & \longrightarrow & M & \longrightarrow & \tilde{\Gamma}_{\mathbb{Q}} & \longrightarrow & 1. \end{array}$$

We then see immediately that the image of $G_{\rho_0,\sigma_0}^{\natural|\sharp}$ in M is none other than $M^{\natural|\sharp}$ (107). We therefore have 684

Apparatus for this scan

140-3-s685-I001 *insertion. Manuscript:* the one

[scan 689]

[p. 647]

We have seen (page 626′, (55)) that $M^{?} \longrightarrow M$ makes $M^{?}$ an extension of M with kernel μ_ρ. Thus the kernel of $M^{?}_{\rho_0,\sigma_0} \longrightarrow M^{\natural|\sharp}$ is equal to $\mu_\rho \cap M^{?}_{\rho_0,\sigma_0}$ now it is clear that we have $\mu_\rho \subset M^{\natural|\sharp}_{\rho_0,\sigma_0}$ cf. (119|114)[i1], hence $\mu_\rho \subset M^{\natural|\sharp?}_{\rho_0,\sigma_0}$.

We thus find a [d1]homomorphism[i2] of exact sequences

(126)

$$\begin{array}{ccccccccc} & & & & M^{\natural|\sharp}_{\rho_0,\sigma_0} & & & & \\ & & & & \cup & & & & \\ 1 & \to & \mu_\rho & \to & M^{\natural|\sharp?}_{\rho_0,\sigma_0} & \to & M^{\natural|\sharp} & & \\ & & \| & & \curlyvee & & \curlyvee & & \\ 1 & \to & \mu_\rho & \longrightarrow & M^{?} & \longrightarrow & M & \longrightarrow & 1 \end{array}$$

and it remains to see whether the [d2]homomorphism[i5]

$$(\infty) \qquad M^{?}_{\rho_0,\sigma_0} \twoheadrightarrow M^{\natural|\sharp}$$

is an epimorphism, and if not, characterize its image. [d3] Let us note that the definition, (124) also gives[i6] [d4] taking into account the expressions (118) for [d5] $M^{\natural|\sharp}_{\rho_0,\sigma_0}$ and (122) for $M^{?}$:

$$(127) \qquad M^{\natural|\sharp?}_{\rho_0,\sigma_0} \simeq N^{\natural|\sharp?}_{\rho_0} \times_{\Gamma_0^{\natural|\sharp}} Z^{\natural|\sharp!}_{\sigma_0 0} \times_{\Gamma_0^{\natural|\sharp}} M^{\natural|\sharp}$$

m1374

Marginal note. [m1374]

$$\begin{array}{ccc} \gamma_0 & \subset & \widetilde{\Gamma}_{\mathbb{Q}} \\ \| & & \\ \mathrm{Im}(M^{\natural|\sharp}) & & \end{array}$$

where we have set

$$(128) \qquad \begin{cases} N^{\natural|\sharp?}_{\rho_0} = N^{?}_{\rho_0} \cap N^{\natural|\sharp}_{\rho_0} = N^{?|!}_{\rho_0} \cap M^{\natural|\sharp} \\ Z^{\natural|\sharp!}_{\sigma_0 0} = Z^{!}_{\sigma_0 0} \cap N^{\natural|\sharp}_{\sigma_0} = Z^{!}_{\sigma_0 0} \cap M^{\natural|\sharp} \end{cases}$$

[scan 690]

and the homomorphism $(\infty|\alpha)$ is none other than the third projection of the fiber product. Thus the image of $(\infty|\alpha)$ is none other than the inverse image, in $M^{\natural|\sharp}$ under $M^{\natural|\sharp} \longrightarrow \gamma_0 = \gamma_{\rho_0,\sigma_0}$ of the image of

$$(\infty\infty|\alpha\alpha) \qquad N_{\rho_0}^{\natural|\sharp?} \underset{\Gamma_0^{\natural|\sharp}}{\times} N_{\sigma_0 0}^{\natural|\sharp!} \longrightarrow \Gamma_0^{\natural|\sharp} (\subset \Gamma_0)$$

It thus remains to show that this homomorphism is surjective, or again that the homomorphisms

$$\begin{cases} N_{\rho_0}^{\natural|\sharp ?} \longrightarrow \Gamma_0^{\natural|\sharp} \\ N_{\sigma_0 0}^{\natural|\sharp !} \longrightarrow \Gamma_0^{\natural|\sharp} \end{cases}$$

are surjective (the first will then be an extension of $\Gamma_0^{\natural|\sharp}$ by μ_ρ, the second an isomorphism). So let $u \in \Gamma_0^{\natural|\sharp}$, [d6]coming from[i5] $u_0 \in M^{\natural|\sharp} \simeq G_{\rho,\sigma}^{\natural|\sharp}$ thus satisfying conditions a) b) c) d) of (107). We thus see that there exists $\beta_0 \in \mathcal{G}_0^{\natural|\sharp} \subset M^{\natural|\sharp}$ such that $\beta^{-1} u_0 \in N(\sigma_0)$.
m1376

Marginal note. [m1376] Here I have avoided the verifications, thinking I would return to them in the following pages, it turns out that this is not urgent – it was more important to develop the special cases "Fermat tower|towers" to clarify the ideas of the general formulations of the $M_{\rho,\sigma}$....[i7]

[p. 648]

9°) Digression on group formalism.

ⓐ

Let

$$(1) \qquad G, \quad \mathcal{G} \subset G, \quad N \overset{\varphi_N}{\hookrightarrow} G, \quad \text{hence} \quad SN = \varphi^{-1}(\mathcal{G}) \subset N$$

be the situation of a group G, invariant subgroup $\mathcal{G}$, and subgroup N such that

$$(\alpha) \qquad N \xrightarrow{\text{epimorphism}} G/\mathcal{G}, \qquad \text{i.e.} \quad N/SN \xrightarrow{\sim} G/\mathcal{G}$$

d3 We are going to reconstruct this situation from the following one

$$(2) \qquad \mathcal{G}, \quad N, \quad SN \subset N, \quad N \overset{\Theta}{\longrightarrow} \mathrm{Aut}(\mathcal{G}), \quad SN \xrightarrow[\varphi=\varphi_{SN}]{} \mathcal{G}$$

where $\mathcal{G}, N$ are groups, SN a normal subgroup of N, $N \longrightarrow \mathrm{Aut}(\mathcal{G})$ a homomorphism of groups, i.e. an action of N on $\mathcal{G}$; finally $SN \longrightarrow \mathcal{G}$ a homomorphism of groups. We assume that d7 d8

$$(3) \qquad \begin{cases} \text{a) the action of } SN \text{ on } \mathcal{G} \text{ induced|induced by that of } \mathcal{G}|G, \\ \text{is also that deduced from } SN \longrightarrow \mathcal{G}, \\ \text{via the adjoint operation of } \mathcal{G}, \\ \text{b) } SN \longrightarrow \mathcal{G} \text{ is compatible with the actions of } N. \end{cases}$$

and d9 d10 clear how (1) defines (2), let us show how a system (2) allows one to reconstruct a system (1). 690

[scan 692]

We thus start from (2), we set

$$(4) \qquad S_0 G = N.\mathcal{G} \qquad \text{(Ch direct|direct product)},$$

we define a homomorphism

$$(5) \quad \begin{cases} SN \xhookrightarrow{\ i\ } S_0 G \\ u \longmapsto u.\varphi(u)^{-1} = \varphi(u)^{-1}.u \end{cases}$$

m1379

Marginal note. m1379 N.B. we have (by hypothesis (a))i1 for $u \in SN$, $x \in \mathcal{G}$

$$(*) \quad \begin{cases} u(x) = \underbrace{uxu^{-1}}_{\substack{\text{in } S_0 G \\ =N.\mathcal{G}}} = \varphi(u) x \varphi(u)^{-1} \end{cases}$$

so if $x = \varphi(u)$, we have

$$u(x) = uxu^{-1} = x$$

i.e. $x = \varphi(u)$ and u commute.

Let us check that it is a homomorphism [d1]

$$i(u'u) = (u'u)\varphi(u'u)^{-1}$$

$$i(u')i(u) = u'\varphi(u')^{-1}u\varphi(u)^{-1}$$

$$= u'u \underbrace{(u^{-1}\varphi(u'^{-1})u)}_{=\varphi(u^{-1})\varphi(u'^{-1})\varphi(u)\text{ by a)}} \varphi(u^{-1})$$

$$= u'u\varphi(u^{-1}u'^{-1}) = (u'u)\varphi((u'u)^{-1}) = (u'u)\varphi(u'u)^{-1} \qquad \text{ok.}$$

We have not yet used the fact that is normal in N, and hypothesis (b)[i2] this implies that the image of (4)|(5) is normal in S_0G, for [d5] we have, if $a \in N$, $u \in SN$

$$a(u.\varphi(u)^{-1})a^{-1} = \underbrace{aua^{-1}}_{\in SN} . \underbrace{a\varphi(u^{-1})a^{-1}}_{=\varphi(au^{-1}a^{-1})=\varphi(au^{-1}a^{-1})^{-1}}$$

i.e. the homomorphism (5) [d8] commutes with the actions of N on SN and on $S_0G \supset N$ – thus the image of SN is normalized by $N \subset S_0G$. We still have to check that it is also normalized by $\mathcal{G}$, [d9]but we have better:[i3]

The image of $SN \overset{i}{\to} S_0G$ commutes with $\mathcal{G}$, i.e. 691

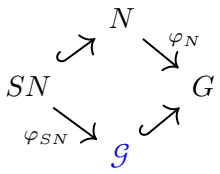
[p. 649]



$\forall u \in SN$, $u\varphi(u)^{-1}$ induces the trivial operation on $\mathcal{G}$ — which is indeed trivial by (3) a).

We can therefore set

$$G \overset{\text{déf|dfn}}{=} S_0G/i(SN), \tag{6}$$

we then find a commutative diagram

(7)

,

we see that the image of $\mathcal{G}$ in G is an invariant subgroup, and that we have an isomorphism on the quotients:

$$N/SN \xrightarrow{\sim} G/\mathcal{G}, \tag{8}$$

which implies that we also have an isomorphism

$$\mathrm{Ker}(\varphi_{SN} : SN \longrightarrow \mathcal{G}) \xrightarrow{\sim} \mathrm{Ker}(N \xrightarrow{\varphi_N} G); \tag{9}$$

d1

(10)

$$\begin{array}{l} \varphi_N : N \longrightarrow G \text{ is an embedding} \\ \Updownarrow \\ \varphi_{SN} : SN \longrightarrow \mathcal{G} \text{ is an embedding.} \end{array}$$

[scan 696]

$$(19) \qquad g = \prod_{i \in I}{}_{\gamma} G_i \qquad \supset \ \mathcal{G}^I$$
(fiber product over γ)

g is an extension of γ by $\mathcal{G}^I$

The datum of a transitive system of isomorphisms between the G_i, inducing the identity on the subgroups $\mathcal{G}$, and compatible with the system d1 transitive of isomorphisms already considered between the $\gamma_i = N_i/SN_i \simeq G_i/\mathcal{G}$, is then equivalent to the datum of a subgroup G of g, satisfying the conditions

$$(20) \qquad \begin{cases} \text{a)} & G \cap \mathcal{G}^I = \text{diagonal } \delta(\mathcal{G}) \text{ of } \mathcal{G}^I \\ \text{b)} & \text{The projection } G \longrightarrow \gamma \text{ is an epimorphism} \end{cases}$$

In other words, we have constructed, with the help of (13) and of the transitive system of isomorphisms between the γ_i, an extension g of their "common value" γ, by $\mathcal{G}^I$ — and the additional structure, corresponding to the datum (11), is the "restriction" of this extension to an extension of γ by the diagonal subgroup of $\mathcal{G}^I$. 695

[p. 650 bis]

50. Schematic envelopes of discrete groups.

d1 (Metabelian case)

1.d2 Let G be a group scheme locally of finite presentation over a base scheme S (the case important for us will be $S = \mathrm{Spec}(\mathbb{Z})$). A section g of G over S is said to be unipotent if on every geometric fiber, d3 $G_{\bar{s}}$, the element $g_{\bar{s}} \in G_{\bar{s}}(\bar{k}|k^a)$ $(k = k(\bar{s}))$ is unipotent, i.e. if there exists a group homomorphism

Unipotent sections

$$(1) \qquad \mathbb{G}_{ak} \xrightarrow{\varphi_{\bar{s}}} G_k \qquad k = k(\bar{s})$$

such that

$$(2) \qquad g_{\bar{s}} = \varphi_{\bar{s}}(1)$$

We say that g is quasi-unipotent if for every $\bar{s}$, there exists $n \in \mathbb{N}^*$ such that $g_{\bar{s}}^n$ is unipotent. If the characteristic of $\bar{s}$ is $p > 0$, then this also means that $g_{\bar{s}}$ is of finite order. We see that if S is quasi-compact, then g is quasi-unipotent iff $\exists n \in \mathbb{N}^*$ such that g^n is unipotent.

d4

d5 For g to be unipotent, it suffices that there exist a homomorphism

$$(3) \qquad \varphi : \mathbb{G}_a \longrightarrow G$$

such that we have

$$(4) \qquad \varphi(1) = g.$$

I wonder whether this is also necessary, in "good" cases. Let us first take the case where $S = \mathrm{Spec}\, K$. In characteristic 0, we have a uniqueness result for φ, which allows us to apply descent theory (valid over any base in characteristic 0): if after an extension $S' \longrightarrow S$ faithfully flat quasi-compact, there exists φ' having the desired properties, then φ exists (over S itself|=). So over a field of characteristic 0 it is OK. In characteristic $p > 0$ the difficulty comes from

the fact that there are group homomorphisms $\mathbb{G}_a \longrightarrow \mathbb{G}_a$:[i1] (such as $x \mapsto x^p - x$) which are [d1] nontrivial, and which are trivial on 1. We shall get around this perhaps[i2] by applying descent with φ which are monomorphisms. [d2] This raises the question:|This leads to the question:[i3] Is a subgroup of G isomorphic to $\mathbb{G}_a$ known when we know an everywhere nontrivial section? Is this at least true over a field as base?

I do not feel like launching into these questions (certainly interesting!), and prefer 5

[p. 651]

to limit myself to a case closer to the one I am after, $S = \operatorname{Spec} \mathbb{Z}$, assuming S noetherian integral, [d1] with generic point η of characteristic 0. This already implies, by the result over a field of characteristic 0, that there exists a nonempty open U

$$(5) \qquad \underset{\substack{\text{open}\\ \text{nonempty}}}{U \subset S} \quad \text{and} \quad \varphi_U : \mathbb{G}_a|U \longrightarrow G|U$$

such that we have (4) on U – and (for U chosen) this φ_U is unique. By uniqueness, we thus see that there is a largest open $\mathcal{U}|U$[i1] over which we can give such a $\varphi|\psi_{\mathcal{U}|U}$, and the question comes down to seeing whether we necessarily have $\mathcal{U}|U = S$.

If we had $U \neq S$, localizing if necessary at a maximal point of $S \setminus \mathcal{U}|S \setminus U$, we [d3] reduce to examining the case where S is local, with closed point s – and to trying to|a little of[i2] prove that in this case, we can extend φ_U over all of S (whence a contradiction…). In the case which interests us, S is regular of dimension 1, so by localizing we find a trait. I shall confine myself to this case, crucial 6

[scan 8]

,|. probably if we want to elucidate the general case, and which suffices for my purpose.

Let η be the generic point of S, s its closed point. Consider the subgroup $L_\eta = \varphi_\eta(\mathbb{G}_{a\eta}) \subset G_\eta$, let L be its schematic closure in G. which is a reduced subgroup scheme of G. Let [d1] $L^0 = L \setminus \big(\bigcup_{\substack{\text{components} \\ \text{of } L_s \text{ non-} \\ \text{identity}}} L_{s,i} \big)$ be its identity component. We have won if we prove that $L^0 \simeq \mathbb{G}_{aS}$. In fact, we are not even|= sure that (L_s^0 [d2] $(= (L_s)^0)$ is reduced! But for $\varphi : \mathbb{G}_{aS} \longrightarrow G$ [d3] extending φ_η to exist, it is probably not necessary that we have $L^0 \simeq \mathbb{G}_a$ – for it is possible that φ is not a monomorphism, i.e. that φ_s is not a monomorphism – it could even|= be the trivial homomorphism (if $g_s = 1$)! But even if $g_s \neq 1$, it is not clear that φ_s is a monomorphism.

Let us take the example where

$$G = \underline{\mathrm{Aut}}_{\mathcal{O}_S}(M) \simeq \mathrm{Gl}(n)_S \tag{6}$$

M a [d4] free module of rank n over S, then we shall have (since η of characteristic 0)

$$\varphi_\eta(\lambda) = \sum \frac{X_\eta^i}{i!}\lambda^i \tag{7}$$

where

$$X_\eta | X \in \mathrm{End}_K(M_K) \qquad K = k(\eta)$$

[scan 9]

[p. 652]

is a nilpotent endomorphism of M_K. thus an element [d1]

$$X \in \mathrm{End}_A(M) \otimes_A K, \qquad X^n = 0. \tag{8}$$

(A the affine ring of S, which is a [d2] gauge) We shall have by hypothesis

$$g_\eta = \varphi_\eta(1) = \sum \frac{X^i}{i!} \in \begin{array}{c} \mathrm{Aut}(M) \\ \cap \\ \mathrm{Aut}(M_K) \end{array}$$

i.e.

$$(9) \qquad \sum \frac{X^i}{i!}, \quad \sum (-1)^i \frac{X^i}{i!} \in \mathrm{End}_A(M)$$

and the question whether φ_η comes from a homomorphism of groups $\mathbb{G}_a \longrightarrow G$ comes down to that of knowing whether

$$(10) \qquad \frac{X^i}{i!} \in \mathrm{End}_A(M) \qquad \forall\, (1 \leq i \leq n-1) | 1 \leq i \leq n-1$$

For $n = 2$ this is trivial, For $n = 3$ ditto|ditto (in (9) there is a single term with a denominator). (for $i = 0$ and $i \geq n | i = n$ this is trivial)

the first doubtful case is $n = 4$ [d4]

$$\varphi_\eta(\lambda) = 1 + X\lambda + \frac{X^2}{2}\lambda^2 + \frac{X^3}{6}\lambda^3 \qquad \begin{matrix} X \in M_4(K) \\ X^4 = 0 \end{matrix}$$

we have by hypothesis $\varphi_\eta(1)$ and $\varphi_\eta(-1)$ in $M_4(A)$, i.e.

$$(11) \qquad \frac{X^2}{2} \pm \frac{X^3}{6} \in M_4(A)$$

we wonder whether it follows that

$$(12) \qquad \frac{X^2}{2}, \frac{X^3}{6} \in M_4(A) \qquad ?$$

If 2 invertible in A this is clear, for we deduce from (11) that $X^2 \in M_4(A)$ hence $\dfrac{X^2}{2} \in M_4(A)$, hence also $X^3/6 \in M_4(A)$, OK. Thus the difficulty 8

[scan 10]

arises here in residual characteristic 2. [d1] Suppose [d2] for simplicity that 2 is[i1] a uniformizer π of A, we shall have, if $X \notin M_4(A)$

$$X = \frac{1}{\dagger 2^\nu} X_0 \quad \text{with} \quad \begin{matrix} X_0 \in M_4(A) \\ X_0 \notin \dagger 2 M_4(A) \end{matrix}$$

hence [d6] the datum of X is equivalent to that of

$$X_0 = \,|\, \in (a_{ij})_{1 \leq i,j \leq 4}, \qquad \text{the } a_{ij} \in A \text{ not all}$$

divisible by 2, with [d9].

$$(11\,\text{bis}) \qquad X_0^4 = 0, \qquad \frac{1}{2}\frac{X_0^2}{2^{2\nu}} \pm \frac{1}{6}\frac{X_0^3}{2^{3\nu}} \in M_4(A)$$

— and the question is whether it follows that we have|have

$$(12\,\text{bis}) \qquad \frac{1}{2}\frac{X_0^2}{2^{2\nu}}, \frac{1}{2}\frac{X_0^3}{2^{3\nu}} \in M_4(A) \qquad ?$$

Of[d10] course, the [d11] answer is trivially|totally yes, if $X_0^3 = 0$ i.e. $X^3 = 0$[i4] — so we are interested in the case where $X_0^3 \neq 0$, i.e. [d12] g_η is "principal unipotent.
m1396

Marginal note. [m1396] Attempt at a characterization of quasi-unipotent sections

2. To get to the bottom of it, one would need a counterexample in the preceding context (with a nilpotent matrix of order 4) — or a theorem ! But for my purpose, it seems that it is not essential to have a solution of this problem.

On the other hand, I shall try the

Theorem (!) Let G be a group scheme (separated)[i5] locally of finite presentation over a scheme S[d14] which is quasi-compact, and let g be a section of G. For g to be quasi-unipotent, it 9

[p. 653] m1398

Marginal note. m1398

is necessary and sufficient that there exist an integer $n > 0$, and a homomorphism of group schemes $\varphi : \mathbb{G}_a \longrightarrow G$, such that we have

$$(13) \qquad \varphi(1) = g^n.$$

Sufficiency being trivial, it is a matter of examining necessity. For simplicity, we shall again suppose S noetherian and integral — once S is assumed noetherian, I think that the reduction to the integral case should be done by easy dévissages, which I do not feel like doing, for lack of essential need ! I shall therefore examine the case S noetherian integral, generic point η

a) Characteristic of η is > 0. Then d1 the hypothesis on g_η is that g_η is of finite order — hence $\exists n > 0$ such that $g_\eta^n = 1$, hence $g^n = 1$. We shall take in (13) this n, and φ the trivial homomorphism.

b) Case where η of characteristic zero. Let φ

$$(14) \qquad \varphi_{1\eta} : \mathbb{G}_{a\eta} \longrightarrow G_\eta$$

be defined by the condition

$$g_\eta = \varphi_{1\eta}(1)$$

let U_1 be its "open set of definition" in S.

Let

$$\varphi_{n\eta}(\lambda) = \lambda^n = \varphi_{1\eta}(n\lambda) : \mathbb{G}_{a\eta} \longrightarrow G_\eta$$

and let U_n be its open set of definition. We thus have

$$(15) \qquad \varphi_{n\eta}(1) = g^n \quad \text{on } U_n$$

d1 and

$$(16) \qquad n \mid n' \implies U_n \subset U_{n'}.$$

We must prove that the union of the U_n is S. We are reduced to the case S local, and where φ_1 is already defined in

$$(17) \qquad U_1 = S \setminus \{s\}, \qquad s \text{ the closed point of } S$$

and this comes down to the

Lemma (!) Let S noetherian integral, G a group scheme separated[i1] locally of finite presentation over S, U a nonempty open set of S, $\varphi_U : \mathbb{G}_{aU} \longrightarrow G_U$ a homomorphism of groups, we assume that $\varphi_U(1) = g_U$ extends to a section g of G over all of S (necessaril[y] unipotent, by known general results of|of the SGA 3) Then there exists an integer > 0 such that $\varphi_U^n : \lambda \longmapsto \varphi_U(\lambda^n)$ extends to|over S a homomorphism

$$\varphi_n : \mathbb{G}_a \longrightarrow G.$$

to

I am not going to try to prove it in this general context of general group schemes, and shall restrict myself, as a decisive test (to carry conviction that it works) the case where $G = \mathrm{Gl}(n)_S$, as earlier, and that where S moreover is regular of dimension 1.

Thus we are reduced to the situation of a gauge A, and of $X \in M_n(K)$ (K the field of fractions) satisfying

11

[p. 654]

$$(18) \qquad \begin{cases} X \in M_n(K) \\ X^n = 0, \quad \sum \dfrac{X^i}{i!} \in M_n(A), \quad \sum \dfrac{(-1)^i X^i}{i!} \in M_n(A) \end{cases}$$

and we want to show that there exists an integer $d > 0$ such that we have

$$(19) \qquad \frac{d^i X^i}{i!} \in M_n(A) \qquad (1 \leq i \leq n-1)$$

If A is of characteristic 0 i.e. if it is a $\mathbb{Q}$-algebra, this [d1] is equivalent[i1] moreover :

$$\frac{X}{} \in M_n(A)$$

m1402

Marginal note. [m1402]

m1403

Marginal note. [m1403] the case of characteristic zero is settled in the affirmative by means of the logarithm function — setting

$$X + \frac{X^2}{2!} + \cdots + \frac{X^{n-1}}{(n-1)!} = Y,$$

we shall have

$$\exp X = 1 + Y, \quad \text{hence}$$
$$X = \log(1+Y) = Y - \frac{Y^2}{2} + \frac{Y^3}{3} \ldots$$

Works over any base ring of characteristic zero… *b*|0

i.e. It would have to be that in the case of characteristic 0, it is φ_U itself that can already extend to all of S. The first doubtful case in this regard seems to me $n|m = 5$

$$(20) \qquad \begin{cases} X \in M_5(A|K), \ X^5 = 0 \\ \frac{X^2}{2} \pm \frac{X^3}{3!} + \frac{X^4}{4!} \in M_5(A) \\ \overset{?}{\Longrightarrow} \qquad X \in M_5(A) \end{cases}$$

On the other hand, in the case considered a little earlier ($n = 4$, residual characteristic 2 — the only one that causes difficulties) it is clear that it suffices to take for d a sufficiently large power of 2.

This remark applies to the mixed characteristic cases. We should indeed have this

Corollary to the lemma dubious : if S is local, of residual characteristic $p > 0$, and if φ is defined on an open set which contains $S - V(p)$, (i.e. if the complement of U is of characteristic $p > | \geq 0$ — in fact unnecessary of course that S be local) then $\exists q = p^{r|n}$ such that φ^q extends. 12

[scan 14]

When G is affine, this should be trivial. We are going to try the

Proposition Let|Let S be a quasi-compact prescheme, n an integer $\geq 1| \geq 0$, [d1] $S_0 = V(n) \subset S$ the closed subscheme defined by $n.1_S$ (thus if $x \in S$, we have $x \in S_0$ iff [d2] [d3] characteristic $x \mid n$[i1]), $U = S \setminus S_0$,[i2] G an affine group scheme of finite presentation|finite type[i3] over S, and

$$\varphi_U : \mathbb{G}_a|U \longrightarrow G|U \tag{21}$$

a group homomorphism. We assume U schematically dense in S.[i4] Then there exists a power[i5] integer [d4] $m = n^\nu$ of n,[i6] [d5] and a homomorphism of group schemes

$$\psi_m : \mathbb{G}_a \longrightarrow G;|,$$

such that we have

$$\psi_m|U = (\varphi_U^m : \lambda \longmapsto \varphi_U(m\lambda) = \varphi_U(\lambda)^m) \tag{22}$$

Let us indeed consider the endomorphism

$$u_m : \mathbb{G}_a \longrightarrow \mathbb{G}_a \qquad \lambda \longmapsto m\lambda$$

Then formula (22) means that we have commutativity

$$\begin{array}{ccc} \mathbb{G}_{aU} & \xrightarrow{(u_m)_U} & \mathbb{G}_{aU} \\ & \searrow^{\psi_U} & \downarrow{\scriptstyle \varphi_U} \\ & & G_U \end{array}$$

and the existence of the $\psi_i|\psi_m$ for large m, means that for large m the composite homomorphism

$$\varphi_U \circ u_m : \mathbb{G}_{aU} \longrightarrow |\text{—} G_U$$

extends to a group homomorphism $\mathbb{G}_a \longrightarrow G$. 13

[scan 15]

[p. 655]

For reasons of schematic density and uniqueness, it suffices to prove that φ_U extends to a morphism of [d1] schemes – this[i1] extension will automatically be a homomorphism of group schemes. [d2] We may assume S Affine, let[i2] A be its ring, and let B be that of G. So the ring of U will be [d3] $A_n \overset{\text{déf}}{=} A[1/n]$, that of G will be $B \otimes_A A_n = B_n$, by hypothesis we have a homomorphism (corresponding to $\varphi_U^*|\varphi_U$)

$$(23) \qquad B_n \xrightarrow{\varphi} A_n[T]$$

whereas the homomorphism [d4] corresponding[i3] to ψ_{mU} will be the composite of the preceding one with

$$A_n[T] \xrightarrow{\psi^*_m | u^*_n} A_n[T] \tag{24}$$

$$T \longmapsto mT \qquad \text{thus} \qquad T^i \longmapsto m^i T^i$$

Let [d5] $x = a_0 + a_1 T + \cdots + a_N T^N \in A_n[T]$ of which|thus the $a_i \in A_n$ we shall therefore have

$$\psi^*_m(x) = \sum a_i m^i T^i = \sum (a_i n^{i\nu}) T^i$$

thus if $m = n^\nu$ is large enough, we shall have

$$m^i a_i \in A \quad \text{i.e} \quad m^i a_i \in A|T^i[T] \qquad \forall i \underline{\underline{\geq \mid >}} 1$$

thus

$$\psi^*_m(x) \equiv a_0 \pmod{A[T]}$$

which shows

$$\psi_m(x) \in A[T] \text{ for } m = n^\nu \text{ large} \iff a_0 \in A \tag{25}$$

[scan 16]

Applying this to the images of elements of B which generate B as an A-algebra, we thus have

Corollary S [d1] n, S_0, U being as in the proposition, and G being an affine scheme of finite type over S (there is no longer any question of a group structure), and $\varphi_U : \mathbb{E}^1_U \longrightarrow G_U$ a morphism of schemes, [d2] $g_U \overset{\text{déf}}{=} \varphi_U(0)$, For there to exist a [d4] power $m = n^\nu$ of n such that $\varphi_U \circ \psi_m | u_m$ [d5] (where u_m given by (24)) extends to S[i1], it is necessary and sufficient that g_U extend to a section g of G over S.

Remark the preceding arguments prove in any case the dubious "theorem" on page 662|652' in the case where S is noetherian of dimension 1 (the case of interest to us being the one where the generic point of S is of characteristic 0).

m1408

m1410

Marginal note. [m1410] I am complicating my life over the construction of $\underline{\mathfrak{S}}$, it suffices to set $\underline{\mathfrak{S}} = \mathfrak{S}_{S_0} \times_{M_{S_0}} \underline{M}_{S_0}$.

preliminary exercise, relative to a situation

$$(26) \qquad 1 \longrightarrow M \longrightarrow \mathfrak{S} \longrightarrow H \longrightarrow 1$$

exact sequence of discrete groups, with M commutative – the case which will interest us later on being the one where M is a free $\mathbb{Z}$-module of finite type. In any case M is a $\mathbb{Z}$-module, and as such defines a Group over $S_0 = \operatorname{Spec}\mathbb{Z}$, namely

$$A \longmapsto M \otimes_{\mathbb{Z}} A$$

(A, commutative $\mathbb{Z}$-algebra) – which we shall denote by $\underline{M}$. In fact, $\underline{M}$ is representable, i.e. is a group scheme iff M is free of finite type. I feel like also defining [d2] Groups over S_0 (which will be group schemes if M is) $\underline{\mathfrak{S}}, \underline{H}$, and an exact sequence

$$(27) \qquad 1 \longrightarrow \underline{M} \longrightarrow \underline{\mathfrak{S}} \longrightarrow \underline{H} \longrightarrow 1$$

of Groups over S_0, and an isomorphism of exact sequences

$$(28) \qquad \begin{array}{ccccccccc} 1 & \longrightarrow & M & \longrightarrow & \mathfrak{S} & \longrightarrow & H & \longrightarrow & 1 \\ & & \downarrow\wr & & \downarrow\wr & & \downarrow\wr & & \\ 1 & \longrightarrow & \underline{M}(\mathbb{Z}) & \longrightarrow & \underline{\mathfrak{S}}(\mathbb{Z}) & \longrightarrow & \underline{H}(\mathbb{Z}) & \longrightarrow & 1 \end{array}$$

we shall take

$$(29) \qquad \underline{H} = H_{S_0} \qquad \text{constant Group with value } H$$

and the outermost vertical arrows of (28) 16

will be|are the canonical isomorphisms.

We can think of defining $\underline{\mathfrak{S}}$ as a functor (covariant)[i1] in $A/\mathbb{Z}$ or (contravariant) in S/S_0, by

$$(30) \qquad \underline{\mathfrak{S}}(A) = \mathfrak{S} \wedge_M \underbrace{M(A)}_{M \otimes_{\mathbb{Z}} A}$$

[d2]. $\underline{\mathfrak{S}}(A)$ thus being defined as the extension of H by $M(A)$ deduced from the extension $\mathfrak{S}$ of H by M by the homomorphism

$$(31) \qquad M \longrightarrow M \otimes_{\mathbb{Z}} A \ ,$$

which we consider as a homomorphism of H-$\mathbb{Z}$-modules, by letting H operate on $M \otimes_{\mathbb{Z}} A$ via its operation on M.

The small difficulty is that the group|groups-functor thus defined by (30) is not itself representable – it gives the correct expression for $\underline{\mathfrak{S}}(A)$ only if Spec A is connected – it corresponds to the subfunctor of

$$S \longmapsto \underset{\sim}{:}\underline{\mathfrak{S}}(A) = \underline{\mathfrak{S}}(S) \qquad (S = \operatorname{Spec} A)$$

consisting of the [d4] $S \longrightarrow \underline{\mathfrak{S}}$[i4] such that the composite

$$(32) \qquad S \longrightarrow \underline{H}_S$$

(which corresponds to a locally constant|constant function on S with values in H) is (entirely)[i5] constant. 17

[p. 657]

The correct expression will be obtained by starting from the [illeg. 1][i1] "incorrect" functor

$$[\underline{\mathfrak{S}}] : A \longmapsto \mathfrak{S} \wedge_M (M \otimes_{\mathbb{Z}} A)$$

or better, from the contravariant functor|contrafunctor

$$S \longmapsto \mathfrak{S} \wedge_M \Gamma(S, M \otimes_{\mathbb{Z}} \underline{\mathcal{O}|O}_S) \ ,$$

and taking the associated Zariski sheaf – in fact we shall have. =

$$(33)\qquad \underline{\mathfrak{S}}(S) = \varinjlim_{\mathcal{U}=(U_i)_{i\in S|I}} \prod_{i\in I} [\mathfrak{S}](U_i)$$

$(U_i)_{i\in I}$ a partition of S into schemes open $\quad S \simeq \coprod U_i$

Here is another way of presenting the construction of $\underline{\mathfrak{S}}$, using the general construction of §49 – in the sheaf-theoretic context. We have a system

$$(34)\qquad \underbrace{\underline{M}}_{\text{Group over } S_0}\ ,\quad \underbrace{\mathfrak{S}_{S_0} \supset M_{S_0}}_{\substack{\text{Groups (constant)}\\ \text{over } S_0,\ M_{S_0}\\ \text{normal}}}\ ,\quad \text{Op.}^{\Theta|\theta} \text{ of } \mathfrak{S}_{S_0} \text{ on } \underline{M},$$

$$\text{homomorphism } \varphi : M_{S_0} \longrightarrow \underline{M}$$

(where the operation of $\mathfrak{S}_{S_0}$ on $\underline{M}$, which amounts to an operation of $\mathfrak{S}$ on $\underline{M}$, is the one deduced from the operation of $\mathfrak{S}$ on M, by functoriality) these data satisfying the compatibility conditions a) b) of loc. cit. By the construction of|of loc. cit., we construct 18

[p. 658]

In fact, by construction we have a commutative diagram of exact sequences

$$(38)\qquad \begin{array}{ccccccccc} 1 & \longrightarrow & M_{S_0} & \longrightarrow & \mathcal{G}_{S_0} & \longrightarrow & H_{S_0} & \longrightarrow & 1 \\ & & \downarrow & & \downarrow & & \Downarrow & & \\ 1 & \longrightarrow & \underline{M} & \longrightarrow & \underline{\mathcal{G}} & \longrightarrow & H_{S_0} & \longrightarrow & 1 \end{array}$$

which on passing to sections gives [d1] S [d2] affine (say) connected a commutative diagram

$$(39)\qquad \begin{array}{ccccccccc} 1 & \longrightarrow & M & \longrightarrow & \mathcal{G} & \longrightarrow & H & \longrightarrow & 1 \\ & & \downarrow & & \downarrow & & \Downarrow & & \\ 1 & \longrightarrow & M \otimes_{\mathbb{Z}} A & \longrightarrow & \underline{\mathcal{G}}(A) & \longrightarrow & H & \longrightarrow & 1. \end{array}$$

For $S = S_0$ we recover the announced isomorphism (28).
m1416

Marginal note. m1416 N.B. As a sheaf (without S-group structure) $\underline{\mathcal{G}}$ is isomorphic to the d3sheafi1 sum of the H copies of $\underline{M}$ – it is therefore representable if $\underline{M}$ is.

This construction of the S_0-group scheme $\underline{\mathcal{G}}$, from an exact sequence (27), is manifestly functorial with respect|with respect to the latter: a homomorphism of exact sequences

$$(40) \qquad \begin{array}{ccccccccc} 1 & \longrightarrow & M & \longrightarrow & \mathcal{G} & \longrightarrow & H & \longrightarrow & 1 \\ & & \downarrow & & \downarrow & & \downarrow & & \\ 1 & \longrightarrow & M' & \longrightarrow & \mathcal{G}' & \longrightarrow & H' & \longrightarrow & 1 \end{array}$$

gives rise to a commutative diagram of exact sequences 20

[scan 24]

Now the first is affine, as a finite sum of affine schemes, the second is affine — so the morphism is affine.

This being so, the projective limit of the $\underline{\mathcal{G}}_i$ in the category of schemes exists (more precisely, the projective limit functor of the $\underline{\mathcal{G}}_i$ is representable) — it is perhaps not absurd to pass to the limit outright, and to work with this group scheme — not of finite type.

Remark The pro-group $(\underline{\mathcal{G}}_i)$ over $S_0 = \operatorname{Spec} \mathcal{G}|\mathbb{Z}$ depends only on the [d1], discrete group $\mathcal{G}$, equipped with a class of subgroups [d2i1] modulo commensurability — the hypothesis to be made being that among these subgroups, there are some which are $\mathbb{Z}$-modules [d3] of finite type (for taking them small enough, they are free of finite type). If M_0 is itself of finite index in $\mathcal{G}$ i.e. if [d4]one of the|$\forall$ of the[i2] H_i are finite, 23

[p. 660]

then this pro-object depends only on $\mathcal{G}$ itself — subject to the condition that there exists a subgroup of finite index in $\mathcal{G}$ which is a commutative group, of finite type as a $\mathbb{Z}$-module. (We then say that $\mathcal{G}$ is "metabelian".)

d1

3

Thus, for $\forall$ discrete group $\mathcal{G}$[i1] that is metabelian, we have constructed a pro-group scheme, projective system of affine group schemes,[i2] which I will denote by

$$(46) \qquad \mathrm{Env}(\mathcal{G}) = (\underline{\mathcal{G}}_i)$$

(the index set being made up of the normal subgroups of $\mathcal{G}$ which are commutative and torsion-free). This pro-group depends functorially on $\mathcal{G}$. It has properties of exactnesses|of exactness that are interesting and $\pm$ obvious, for example it is multiplicative

$$(47) \qquad \mathrm{Env}(\mathcal{G}\times\mathcal{G}')\xrightarrow{\sim}\mathrm{Env}(\mathcal{G})\times_{S_0}\mathrm{Env}(\mathcal{G}').$$

If we have an exact sequence

$$(48) \qquad 1 \longrightarrow \mathcal{G}'' \longrightarrow \mathcal{G} \longrightarrow \mathcal{G}' \longrightarrow 1$$

of metabelian groups, we have an exact sequence for the envelopes

$$(49) \qquad 1 \longrightarrow \mathrm{Env}(\mathcal{G}'') \longrightarrow \mathrm{Env}(\mathcal{G}) \longrightarrow \mathrm{Env}(\mathcal{G}') \longrightarrow 1$$

[scan 26]

in a sense which should be made precise on occasion — for the associated group schemes (obtained by passing to the limit) — we do indeed have a faithfully flat homomorphism whose kernel is the right one …

The typical case, to which the general case reduces in a fairly immediate way, is the one where $\mathcal{G} = M = \mathbb{Z}$. We have for $\forall$ integer $n \geq 1$ the exact sequence

$$(50) \qquad 1 \longrightarrow \mathbb{Z} \xrightarrow{n} \mathbb{Z} \longrightarrow \mathbb{Z}/n\mathbb{Z} \longrightarrow 1$$

I am going to [d1] make explicit the construction of the corresponding extension of $\mathbb{Z}/n\mathbb{Z}$ by $\underline{\mathbb{Z}} = \mathbb{G}_a$, i.e. $\underline{\mathcal{G}}_n$.

It is an affine scheme, whose coordinate ring is isomorphic — in a not very canonical way — to the product of the n copies of that of $\underline{\mathbb{Z}} = \mathbb{G}_a$, namely $\mathbb{Z}[T]$ — we find such an isomorphism by choosing a set-theoretic section of $\mathbb{Z}$ over $\mathbb{Z}/n\mathbb{Z}$, for example by the set of integers $\mathbb{Z}\cap[0, n-1]$. The homomorphisms of

[p. 661]

transition between the $\underline{\mathcal{G}}_n$ have nothing flat about them of course. Passing to the projective limit, we find an extension of

$$(\widehat{\mathbb{Z}})_{S_0} \overset{\text{dfn}}{=} \varprojlim_n (\mathbb{Z}/n\mathbb{Z})_{S_0}$$

— constant profinite group scheme over S_0 — by the projective limit of the schemes $\mathbb{G}_a$, mapping to itself by the homomorphisms seen [d1] of 2°) — it is the spectrum of the inductive limit ring of the

$$\mathbb{Z}[T_n] \subset \mathbb{Q}[T]$$
$$T_n = \frac{1}{n}T$$

which is thus, strange to say, the [d2] sub-[i1]$\mathbb{Z}$-algebra of $\mathbb{Q}[T]$ formed|formed by the polynomials for which the constant term is an integer.

We have an analogous description of the projective limit of the schematic envelope of $\mathbb{Z}^n$ — it is an extension of $(\widehat{\mathbb{Z}}^n)_{S_0}$ (beware of the abuse of notation) by an identity component, which is the spectrum of the subring of $\mathbb{Q}[T_1, \dots, T_n]$ formed by the polynomials whose constant term is an integer … 26

5. Universal characterization of the schematic envelope of a metabelian group.

Let G be a group scheme locally of finite presentation over a base S. We say that a homomorphism of group schemes

$$H \longrightarrow G$$

is [d1] unipotent (resp. quasi-unipotent) if the image of $\forall$ element of H is a unipotent element (resp. quasi unipotent) of G — which is checked fiber by fiber.

A homomorphism from a discrete group

$$\mathcal{G} \longrightarrow \Gamma(G/S)$$

is said to be unipotent (resp. quasi-unipotent) if the homomorphism of group schemes [d2] which[i1] corresponds to it

$$\mathcal{G}_S \longrightarrow G$$

is unipotent (resp. quasi-unipotent). 29

[scan 31]

[p. 663]

Note that by the properties of $\varprojlim$ of filtered projective systems (with affine transition morphisms) [d1] of schemes, if $\mathcal{G}$ is metabelian, whence a projective system of affine group schemes over S_0, hence over S, denoted $\mathrm{Env}_{\underline{S|S}}(\mathcal{G})$, and a projective limit

$$L\,\mathrm{Env}_S(\mathcal{G}) = L\,\mathrm{Env}(\mathcal{G}) \times_{S_0} S \tag{57}$$
$$\simeq \varprojlim \mathrm{Env}_S(\mathcal{G}),$$

we have, as soon as G is locally of finite presentation

(58)

$$\begin{array}{ccc} \mathrm{Hom}_{\mathrm{progr}/S}(\mathrm{Env}_S(\mathcal{G}), G) & \xrightarrow{\sim} & \mathrm{Hom}(\mathrm{Env}_S(\mathcal{G}), G) \\ \overset{\mathrm{def}}{\Vert} & & \\ \varprojlim_i \mathrm{Hom}(\underline{\mathcal{G}}_{i\,S}, G) & & \end{array}$$

Note on the other hand that we have a [d2] canonical homomorphism

(59)

$$\mathcal{G}_S \longrightarrow L\,\mathrm{Env}_S(\mathcal{G})$$

deduced by change of base from the homomorphism over the universal base S_0

(59 bis)

$$\mathcal{G}_{S_0} \longrightarrow L\,\mathrm{Env}(\mathcal{G})$$

coming from the system of canonical homomorphisms 30

[scan 34]

is written, introducing

N.B. $\lambda_\infty \overset{\text{dfn}}{=} -\ell_\infty$

$$(6) \qquad \lambda_\infty = \rho\sigma\rho^{-1}\sigma\rho = \rho(\sigma)\sigma\rho = -\rho\sigma(\rho)^{-1}\rho = \rho\sigma\rho^{-1}(\sigma)$$

in the form

$$(7) \qquad [\sigma, \lambda_\infty] = 1.$$

N.B. $\sigma = \sigma_\infty$

m1438

Marginal note. m1438 N.B. We find

$$\begin{cases} [\ell_0, \ell_1] = [\lambda_0, \lambda_1] = (\sigma(\rho)\rho^{-1})^3 \\ [\underset{\sigma}{\sigma}, \ell_\infty] = [\underbrace{\sigma_\infty}_{\sigma}, \lambda_\infty] = (\sigma(\rho^{-1})\rho)^3 \\ \qquad\quad = \mathrm{int}(\sigma\rho^{-1}) \cdot [\ell_0, \ell_1] \end{cases}$$

We are going to define a group scheme $\underline{\mathcal{G}}$[i1] over $\mathbb{Z}$, whose $\widehat{\mathbb{Z}}|\mathbb{Z}$-[i2]points will be (up to an isomorphism say)[i3] the points of $\widehat{\mathcal{G}}$. We put

$$(8) \qquad \underline{M} = \underline{\mathcal{G}}^\circ = \mathbb{G}_a|\mathbb{E}_a{}^{\{0,1,\infty\}}/\text{diagonal}$$

m1439

Marginal note. m1439 It is better to denote it by $\underline{M}$ — there are already too many $\mathcal{G}$'s!

We are going to have [d3]

$$(4) \qquad \mathcal{G} \simeq \mathrm{GL}(2,\mathbb{Z})/[\Pi_0, \Pi_0]$$

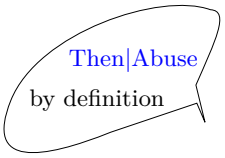
operate on $\underline{M}$, [d7] through[i4]

$$(5) \qquad \underbrace{\mathcal{G}_3 \times \mu_{\tau|2}}_{\simeq T_{0,3}|\Gamma_{0,3}} \simeq \mathcal{G}/M \simeq \mathcal{G}_{0,3}/\Pi.$$

Denoting by $\dot\lambda_0, \dot\lambda_1, \dot\lambda_\infty$ the images of the $\lambda_i = -\ell_i$ in $\mathcal{G}$, identified with elements of

$$M = \mathcal{G}^\circ = \underline{\mathcal{G}}^\circ(\widehat{\mathbb{Z}})$$

— in fact we have



$$(6) \qquad \begin{cases} \dot\lambda_0, |>\dot\lambda_1, \dot\lambda_\infty \in \underline{M}(\mathbb{Z}) \subset \underline{M}(\widehat{\mathbb{Z}}) = M \otimes_{\cdot|\mathbb{Z}} \mathbb{Z}|\widehat{\mathbb{Z}} \\ \text{thus,} \quad \dot\lambda_0 + \dot\lambda_1 + \dot\lambda_\infty = 0 \end{cases}$$

m1440

Marginal note. m1440 (here we write the group law in $M = \underline{\mathcal{G}}^\circ$ additively)

m1441

Marginal note. m1441

$\mathcal{G}_3$ operates on $\underline{M} = \underline{\mathcal{G}}^\circ$ by its action on the canonical [d14] generators[i7] $\dot\lambda_0, \dot\lambda_1, \dot\lambda_\infty$, thus

$$(7) \qquad \begin{cases} \sigma(\dot\lambda_0) = \dot\lambda_1, \quad \sigma(\dot\lambda_1) = \dot\lambda_0 \quad \text{hence} \quad \sigma(\dot\lambda_\infty) = \dot\lambda_\infty \\ \rho(\dot\lambda_i) = \dot\lambda_{i+1} \end{cases}$$

m1442

Marginal note. [m1442] This is seen first for $i = 0, 1$ and, is deduced from it for $i = \infty$.

On the other hand we have by definition

$$(8) \qquad \tau(\dot\lambda_i) = -\dot\lambda_i$$

where

$$\begin{array}{ccccc} \tau & = & \sigma & \tau' \\ \| & & & \| \\ \tau_\infty & & & \tau'_\infty \end{array}$$

[scan 35]

[p. 665]

. The announced extension $\underline{\mathcal{G}}$ is of course that of § 50 3°), developed in the meantime (since the first lines of the present §, noting precisely that I was feeling cramped in making the construction explicit) :

(9)

$$1 \longrightarrow \underline{M} \longrightarrow \underline{\mathcal{G}} \longrightarrow H_{S_0} \longrightarrow 1$$
$$\underline{M} \parallel \check{V}(M)$$

where $S_0 = \operatorname{Spec} \mathbb{Z}$.

For $\forall$ scheme S, we will put

$$\begin{gathered}\underline{\mathcal{G}}^{\Delta}(S) \subset \underline{\mathcal{G}}(S) \\ \| \text{ dfn} \\ \text{Inverse image of the "diagonal" of} \\ \Gamma(H_{S|S_0}/S) \quad \text{(i.e. of the image of } H \longrightarrow \Gamma(H_{S|S_0}, S)) \\ \text{under the canonical homomorphism } \underline{\mathcal{G}|\mathcal{E}}(S) \longrightarrow H_S(S),\end{gathered} \tag{10}$$

so that by the construction of loc. cit. we will have a canonical isomorphism

$$\underline{\mathcal{G}}^{\Delta}(S) \simeq \mathcal{G} \underset{M}{\wedge} \underbrace{\Gamma(S, \underline{\mathcal{O}}_S \otimes_{\mathbb{Z}} M)}_{\simeq M \otimes_{\mathbb{Z}} A \text{ if}} \tag{11}$$

and a canonical exact sequence
(12)

$$1 \longrightarrow \underbrace{\Gamma(S, \underline{\mathcal{O}}_S \otimes_{\mathbb{Z}} M)}_{A \otimes_{\mathbb{Z}} M} \longrightarrow \underline{\mathcal{G}}^{\Delta}(S) \longrightarrow H \longrightarrow 1.$$

S affine with ring A

Taking $A = \widehat{\mathbb{Z}}$, we find in particular (and this is again a general fact about group schemes associated with extensions of discrete groups with abelian kernel)

$$\mathcal{G}^{\wedge} \simeq \underline{\mathcal{G}}^{\Delta}(\widehat{\mathbb{Z}}). \tag{13}$$

2. The group $\widetilde{Z}_{\rho,\sigma}$: provisional version.

. I am now going to make explicit for $\widehat{\mathcal{G}}$ and $\widehat{\mathcal{G}}_{0|\bullet} \longrightarrow \widehat{\mathcal{G}}$ the general constructions of § 49 VI, taking there[i1 d1]

$$\underline{\mathcal{G}}^{\natural} \overset{\text{dfn}}{=} \underline{M} = \underline{\mathcal{G}}^{\circ} \quad \text{(identity component of } \underline{\mathcal{G}}) \tag{14}$$

In a case like this one, where $\underline{\mathcal{G}}^{\natural}$ is precisely the closed subgroup of the (ρ,σ)-group $\mathcal{G}_{\rho,\sigma}$ (= $\mathcal{G}^{\wedge}$ here) generated by $\lambda_0, \lambda_1, \lambda_\infty$, we will dispense in the notation — where there is no ambiguity — with including the notation $\natural$. For $\forall$ A we will have to distinguish for example between $G_{\rho,\sigma}$ and $G^{\natural}_{\rho,\sigma}$ etc. We will however carry out the constructions in the scheme-theoretic setting, rather than the profinite one.

m1445

Marginal note. m1445 I think I will compare the two possible constructions at the end. The underlines will indicate the group schemes...

The essential step is to determine the group $\underline{Z}_{\rho,\sigma}$

$$\begin{array}{c} \underline{Z}_{\rho,\sigma} \subset \underline{\mathrm{Aut}}(\underline{\mathcal{G}}^+) \\ \| \text{ dfn} \\ \left\{ u \in \underline{\mathrm{Aut}}(\mathcal{G}^+) \;\middle|\; \begin{array}{ll} \text{a) } \exists \alpha \in \underline{\mathcal{G}^\natural_\tau} = \{1,\tau\}.\underline{M}, & u(\rho) = \alpha(\rho) \\ \text{b) } \exists \beta \in - - - - - - & u(\sigma) = \beta(\sigma) \\ \text{c) } u(L_0^{\mathcal{G}}) = L_0^{\mathcal{G}} & \\ \qquad (\Longleftrightarrow u(L_0^{\Pi_0}) = L_0^{\Pi_0}) & \\ [\text{d) (automatic)} \quad u(\mathcal{G}^\natural) \subset \mathcal{G}^\natural] & \end{array} \right. \end{array} \tag{15}$$

m1446

Marginal note. m1446 here, "$\exists\alpha$" "$\exists\beta$" of course means the local existence of α, β...

Let us note that u is determined by the values

$$\begin{cases} u(\rho) = \xi\rho \\ u(\sigma) = \eta\sigma \end{cases} \qquad \xi, \eta \in \Gamma\underline{\Pi} \tag{16}$$

m1447

Marginal note. m1447 where $\underline{\Pi} = \underline{M} \rtimes \mu_2$ ($\underline{M}$ subgroup|is a group of index 2 in $\underline{\Pi}$)

[p. 666]

$$\begin{cases} \text{a) } \xi\rho \text{ (locally) conjugate to } \rho \text{ via } \underline{\mathcal{G}^\natural} = \underline{M} \\ \text{b) } \eta\sigma \text{ – – – – – – – – } \sigma \text{ " – – —} \\ \text{c) loop equation} \\ \quad \xi = \eta \ell_1^\nu \quad \text{where } \nu \in \Gamma\mathbb{G}_a \text{ suitable} \\ \qquad \text{(such that } \mu \overset{\text{dfn}}{=} 2\nu + 1 \in \Gamma\mathbb{G}_m) \end{cases} \tag{17}$$

. d1

Remark It is no longer possible here to denote by -1 the nontrivial element ω[i1] of the center $\mu|\mu_2$ of $\mathcal{G}^\wedge$, and to denote by $-x$ (for $x \in \mathcal{G}^\wedge$) the product of x with it, because of the confusion with the notation $-x$ (for $x \in M$)[i2] in the abelian group M for the inverse of x — but d2 $\omega x \neq -x$, since $\omega x \notin M$, $-x \in M$...

We of course put

$$\varepsilon_3(u) = \varepsilon_{\mathcal{G}}(\alpha), \qquad \varepsilon_2(u) = \varepsilon_{\mathcal{G}}(\beta) \tag{18}$$

(well defined, since ρ and ρ^{-1} are not conjugate on any fiber, idem for σ, σ^{-1}), how to make them explicit in terms of ξ, η ? We will have

d3

$$\begin{cases} \xi = \alpha\rho(\alpha)^{-1} \begin{cases} \in \Gamma\underline{M} \quad \text{if } \alpha \in \Gamma\underline{M} = \Gamma\underline{\mathcal{G}^\natural} \text{ i.e. } \varepsilon_3(u) = 1 \\ = \underbrace{\alpha_0}_{\in \Gamma\underline{M}} \tau\rho(\alpha_0\tau)^{-1} = \alpha_0 \underbrace{(-\ell_1^{-1})}_{\lambda_1^{-1} \in \underline{M}} \rho(\alpha_0)^{-1} \in \Gamma\underline{M} \quad \text{if } \varepsilon_3(u) = -1 \end{cases} \\ \eta = \beta\sigma(\beta)^{-1} \begin{cases} \in \Gamma\underline{M} \quad \text{if } \beta \in \Gamma\underline{M} = \Gamma\underline{\mathcal{G}^\natural} \text{ i.e. } \varepsilon_2(u) = 1 \\ = (\underbrace{\beta_0}_{\in \Gamma\underline{M}} \tau)\sigma(\beta_0\tau)^{-1} = \omega\beta_0\sigma(\beta_0)^{-1} \in \omega\underline{M} \quad \text{if } \varepsilon_2(u) = -1 \end{cases} \end{cases} \tag{19}$$

thus in any case

$$\begin{cases} \xi \in \Gamma\underline{M} \\ \eta \in \Gamma(\omega^{\nu_2(u)}.\underline{M}) \end{cases} \tag{19 bis}$$

$$\ell_1^{\nu} = \ell_1^{2\nu'}\ell_1^{\nu_2} = \underbrace{(\omega\lambda_1)^{2\nu'}}_{\lambda_1}\ell_1^{\nu_2} = \lambda_1^{2\nu'}\ell_1^{\nu_2} \tag{24}$$

Since $\ell_1 = \lambda_1\omega$, we I feel like putting the ℓ_i in the form

$$\ell_i = a_i\omega \quad \text{where } a_i \in \underline{M}! \tag{25}$$

can to thus|will be able to write (24) in the form

$$\ell_1^{\nu} = \underbrace{(\lambda_1^{2\nu'}a_1^{\nu_2})}_{\in\Gamma\underline{M}}\omega^{\nu_2} \quad \text{for } \nu_2 = 0|\nu_2 = 1 \text{ i.e. } \varepsilon_2 = 1 \tag{26}$$

To make the a_i explicit, we must expand them as linear combinations of $\lambda_0, \lambda_1, \lambda_\infty$ (or of two of them, if we want uniqueness).

Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

Scans 39–57

[scan 39]

[p. 667]

$$l_1^{\nu} = \lambda_1^{\nu}\omega^{\nu_2}. \tag{24}$$

Setting (cf. (19))

$$\begin{cases} \beta = \beta_0\tau^{\nu_2} & (\beta_0|\beta \in \Gamma\underline{M}) \\ \eta_0 = \beta_0\sigma(\beta_0)^{-1} \end{cases} \tag{25}$$

we shall thus have

$$\eta \overset{\text{dfn}}{=} \beta\sigma(\beta)^{-1} = \beta_0\sigma(\beta_0)\omega^{\nu_2} = \eta_0\omega^{\nu_2}$$

and the loop equation takes the form of an equation in $\underline{M}$

$$\zeta|\xi = \eta_0\lambda_1^{\nu}, \qquad \text{i.e. side of (21)} \tag{26}$$

$$\zeta|\xi = \tag{26bis}$$

where $\zeta|\xi, \eta_0$ are two sections of $\underline{M}$ which determine one another (for given ν). We have thus expressed in a convenient way the loop equation, i.e. the condition c)of (17)[i1], it remains to express a) and b), which are also formulated as

$$\begin{cases} \text{a) } \zeta|\xi \text{ locally of the form } \overset{(\nu_3=0)}{\alpha_0\rho(\alpha_0)^{-1}} \text{ or } \overset{(\nu_3=1)}{\alpha_0\lambda_1^{-1}\rho(\alpha_0)^{-1}} \\ \quad \text{with } \alpha_0 \in \Gamma\underline{M} \\ \text{b) } \eta_0 \text{ locally of the form } \beta_0\sigma(\beta_0)^{-1} \end{cases} \tag{27}$$

(Conditions whose formulation is independent of ν, ν_2 [d2], but depends apparently on ν_3.) To make these conditions explicit, we are going to write $\underline{M}$ additively, the relations read

We have thus also set $\alpha = \alpha_0\tau^{\nu_3}$

$$\begin{cases} \zeta|\xi = \alpha_0 - \rho(\alpha_0) \quad \overset{\text{case}}{(\nu_3 = 0)} \quad \text{or} \quad \zeta|\xi = \alpha_0 - \rho(\alpha_0) - \lambda_1 \quad \overset{\text{case}}{(\nu_3 = 1)} \\ \eta_0 = \beta_0 - \sigma(\beta_0), \end{cases} \tag{28}$$

[scan 40]

which we also express by

$$\begin{cases} \zeta|\xi \in \mathrm{Im}(\mathrm{Id}_{\underline{M}} - \rho_{\underline{M}}) \quad (\nu_3 = 0) \quad \text{or} \quad \zeta|\xi \in -\lambda_1 + \mathrm{Im}(\mathrm{Id}_{\underline{M}} - \rho_{\underline{M}}) \\ \eta_0 \in \mathrm{Im}(\mathrm{Id}_{\underline{M}} - \sigma_{\underline{M}}). \end{cases} \tag{29}$$

It is time to move on to explicit matrix calculations, by referring $\underline{M}$ to the basis λ_0, λ_1. In this basis, the operations of $\rho_{\underline{M}}, \sigma_{\underline{M}}, \tau_{\underline{M}}$ are given by

$$\begin{cases} \rho_{\underline{M}} = \begin{pmatrix} 0 & -1 \\ 1 & -1 \end{pmatrix} & \mathrm{id}_{\underline{M}} - \rho_{\underline{M}} = \begin{pmatrix} 1 & 1 \\ -1 & 2 \end{pmatrix} \\ \sigma_{\underline{M}} = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} & \mathrm{id}_{\underline{M}} - \sigma_{\underline{M}} = \begin{pmatrix} 1 & -1 \\ -1 & 1 \end{pmatrix} \\ \tau_{\underline{M}} = \begin{pmatrix} -1 & 0 \\ 0 & -1 \end{pmatrix}. \end{cases} \tag{30}$$

We have

$$\det(\mathrm{id}_{\underline{M}} - \rho_{\underline{M}}) = 3, \qquad \det(\mathrm{id}_{\underline{M}} - \sigma_{\underline{M}}) = 0$$

which shows that [d1] the endomorphisms $\mathrm{id}_{\underline{M}} - \rho_{\underline{M}}$ and $\mathrm{id}_{\underline{M}} - \sigma_{\underline{M}}$ of $\underline{M}$ are not quite automorphisms[i.e. epimorphisms][i1] — It screws up in characteristic 3 for the first, everywhere [d2][(in every characteristic)][i2] for the second. [d3][We shall have][i3] [d4] reason to take as "parameters" not $\zeta|\xi$ and η_0, but quite obviously α_0 and β_0 (in addition to the discrete "parameters" ν_2, ν_3 and ν'), and to [d5][make][i4] [d6] a group (if possible…) with the systems 39

[scan 41]

[p. 668]

d1

$$\widetilde{\underline{Z}}_{\rho,\sigma} = \left\{ (\nu,\nu',\nu_2,\nu_3,\alpha_0,\beta_0) \;\middle|\; \begin{array}{r} \nu,\nu' \in \Gamma\mathbf{G}_a, \quad \nu_2,\nu_3 \in \Gamma\{0,1\}_{S_0}, \quad \alpha_0,\beta_0 \in \Gamma\underline{M} \\ \left\{ \begin{array}{r} \nu = 2\nu' - |+\nu_2 \qquad 2\nu+1 \in \Gamma\mathbf{G}_m \\ \underbrace{\alpha_0 - \rho(\alpha_0) - |+\nu_3\lambda_1}_{\zeta|\xi} = \underbrace{\beta_0 - \sigma(\beta_0)}_{\eta} + \nu\lambda_1 \end{array} \right. \end{array} \right\} \tag{31}$$

N.B. ν' determines ν which is redundant

The loop equation, in α_0, β_0, thus takes the form

$$(\mathrm{id}|1-\rho_{\underline{M}})\alpha_0 - | = (\mathrm{id}-\sigma_{\underline{M}})(\beta_0) = (\underbrace{2\nu' - |+\nu_2}_{\nu} + |-\nu_3)\lambda_1 \tag{32}$$

m1455

Marginal note. m1455 This must indeed come from the fact that the homomorphism

$$\underline{M}\times\underline{M} \longrightarrow \underline{M}$$

$$(\alpha_0,\beta_0) \longmapsto (\mathrm{id}-\rho_{\underline{M}})\alpha_0 - (1-\sigma_{\underline{M}})(\beta_0)$$

is|is indeed an epimorphism… But this is the case only in characteristic $\neq 3$!

Remark The scheme $\underline{Z}_{\rho,\sigma}$ itself, as it was defined in § 49 d3 VI, is not smooth it seems to me — it gets stuck|gets complicated in characteristics 2 and 3. On the other hand the finer group $\widetilde{\underline{Z}}_{\rho,\sigma}$, defined by bringing in the α,β right away (instead of $(\zeta|\xi,\eta)$) does seem smooth. This leads once again to modifying a little the presentation of the constructions of § 49, by denying myself|not using yet another group $\underline{Z}_{\rho,\sigma}$ (tied to the coordinates $\zeta|\xi,\eta$), and by replacing it with a group which will appear|appears at the same time|in a way i2 as a normalizer of L_0 (or of $L_0^\sharp$) in $\mathcal{M}_{\rho,\sigma}$ (or $\mathcal{M}^{\flat|\sharp}_{\rho,\sigma}$). We shall give a presentation along these lines in the d4 § that follows, and we assume here that this construction is already in hand, 40

[scan 42]

Whence the [d1] (scheme [d2] $\underline{\widetilde{Z}}_{\rho,\sigma}$ will thus have a suitable group structure, and operates on $\underline{C}^+|\underline{G}^+$ via

$$\begin{cases} u(\rho) = (\alpha_0 - \rho(\alpha_0) + \nu_3\lambda_1)\rho \\ u(\sigma) = (\beta_0 - \sigma(\beta_0))\omega^{\nu_2}\sigma. \end{cases} \tag{33}$$

But we must all the same check that these formulas (33) really do determine an automorphism u of $\underline{C}^+|\underline{G}^+$. The essential check : make sure that the [d3]relation[i1] (7)

$$[\sigma, \lambda_\infty] \tag{34}$$

is respected by u.

I am going to make explicit the action of u on $\underline{M}$, by making explicit its values on

$$\begin{cases} \lambda_0 = \omega l_0 = \omega\sigma\rho\sigma\rho \\ \lambda_1 = \omega l_1 = \omega\rho\sigma\rho\sigma \end{cases}$$

in terms of [d4]

$$\begin{cases} \zeta|\xi = \alpha_0 - \rho(\alpha_0) + \nu_3\lambda_1 \\ \eta_0 = \beta_0 - \sigma(\beta_0) \end{cases} \qquad \alpha|\& \qquad \in \Gamma\underline{M} \tag{35}$$

Linked to u by

$$u\rho = \zeta|\xi\rho, \qquad u\sigma = \omega^{\nu_2}\eta_0\sigma. \tag{36}$$

We shall have [d5] by the loop relation

$$u(\varepsilon_0) = \varepsilon_0^{(\mu)} \qquad (\mu = 2\nu + 1 = 4\nu' + 2\nu_2 + 1)$$

whence

[scan 43]

[p. 669]

$$u(l_0) = u(\varepsilon_0^2) = l_0^{(\mu)}$$

and

$$u(\lambda_0) = u(\omega l_0) = \underbrace{u(\omega)}_{=\omega}\, u(l_0) = \omega l_0^{(\mu)} = \underbrace{\omega l_0}_{\lambda_0}(\underbrace{l_0^{(2\nu)}}_{\lambda_0^{2\nu}}) = \lambda_0^{(2\nu+1)} = \lambda_0^{(\mu)}$$

as it should. (To reassure myself, I have checked that the second formula (33) does indeed give

$$u(\sigma^2) = (\eta_0\sigma)(\eta_0\sigma) = (\underbrace{\eta_0\,\sigma(\eta_0)}_{1})\omega = \omega \quad \text{i.e.}$$

$$u(\omega) = \omega \tag{37}$$

We shall have

$$u(\lambda_1) = u(\rho(\lambda_0)) = (\zeta|\xi\rho u)(\lambda_0) = (\zeta|\xi\rho)u(\lambda_0) = (\zeta|\xi\rho)(\lambda_0^\mu) = \lambda_1^\mu$$

thus finally, as predicted

$$u(\lambda) = \mu.\lambda \qquad \text{for} \quad \lambda \in \Gamma\underline{M} \tag{38}$$

We shall indeed have that $u(\sigma) = (\beta_0 - \sigma(\beta_0))\omega^{\nu_2}.\sigma$ commutes with $u(\lambda_\infty) = \mu.\lambda_\infty$.

where $\mu = 2\nu + 1 = 4\nu' + 2\nu_2 + 1$

All these calculations are a bit murky, logically, for at the same time I want to prove the existence of a [d3] u of $\underline{C}^+|\underline{G}^{+}$[i1], and in the preceding calculations I already assume it (implicitly, in a "bigger" group, namely the smooth|free group scheme (heuristic)[i2] generated by $\rho, \sigma \ldots$. One way of making them rigorous would be to use the intrinsic description of $\underline{C}^+|\underline{G}^+$: [d4]

$$\underline{C}^+|\underline{G}^+ = C_{S_0}^+|G_{S_0}^+ \underset{M_{S_0}}{\wedge} \underline{M}_{S_0} \tag{39}$$

thus defining a homomorphism$u$[i3] from $\underline{C}^+|\underline{G}^+$ to an S_0-group G (here $G = \underline{C}^+|\underline{G}^+$) amounts to

define homomorphisms

$$\underline{M}_{S_0} \xrightarrow{u_{\underline{M}}} G^\sharp|G^\natural \ , \qquad C_{S_0}|G_{S_0} \xrightarrow{u_{C|G}} G^\sharp|G^\natural \quad \text{i.e.} \quad C|G \to G^\sharp(S_0)|G^\natural(S_0) \tag{40}$$

satisfying the following two conditions:
a) Commutativity of the diagram

, (41)

and b)

$$\begin{gathered} u_{\underline{M}} \text{ is compatible with the actions} \\ \text{of } C^+_{S_0}|G^+_{S_0} \text{ on } \underline{M}_{S_0} \text{ (via its action on } M_{S_0}) \\ \text{and on } G \text{ (via } u_{C|G}). \end{gathered} \tag{42}$$

In the present case, we will have $G = \underline{C}|\underline{G}$

$$u_{\underline{M}}(\lambda) = i(\mu.\lambda) \tag{43}$$

where

$$i : \quad \underline{M} \hookrightarrow \underline{C}^+|\underline{G}^+$$

is the inclusion, and

$$u_{C|G} : \ C^+_{S_0}|G^+_{S_0} \longrightarrow G \qquad \text{defined by (33)}, \tag{44}$$

We must therefore first check that (33), does define a homomorphism

$$C_{S_0}|G_{S_0} \to G$$

, or what amounts to the same,

$$C|G \to G(S_0)$$

.

[scan 45]

[p. 670] For this we [d1] use the presentation [d2] of $C^+|G^{+\mathrm{i}1}$

$$C^+|G^+ = \left\{ \rho, \sigma \;\middle|\; \begin{array}{cc} \rho^6 = \sigma^4 = 1, & \rho^3 = \sigma^2 \\ [\sigma, \lambda_\infty] = 1 & \text{where} \quad \lambda_\infty = \rho\sigma\rho^{-1}\sigma\rho \end{array} \right\}, \tag{44}$$

thus setting

$$\begin{cases} \rho' = \zeta\rho|u(\rho), \quad \sigma' = \eta_0\omega^{\nu_2}\sigma & \text{cf. (33) and} \\ \zeta|\xi = \alpha_0 - \rho(\alpha_0) + \nu_3\lambda_1, \quad \eta|\eta_0 = \beta_0 - \sigma(\beta_0) \end{cases} \tag{45}$$

we must check the relations

$$\rho'^6 = \sigma'^4 = [\sigma', \lambda'_\infty] = 1, \quad \rho'^3 = \sigma'^2 \quad \text{where} \quad \lambda'_\infty = \rho'\sigma'\rho'^{-1}\sigma'\rho'. \tag{46}$$

We will begin by checking [d6]

$$\rho'^3 = \sigma'^2 = \omega \tag{47}$$

which implies [d7]

$$\rho'^6 = \sigma'^4 = 1, \quad \text{thus} \quad \exists \begin{array}{c} C^+_0|G^+_0 \xrightarrow{u_{C_0|G_0}} G(S_0) \\ \rho \longmapsto \rho', \quad \sigma \mapsto \sigma' \end{array} \tag{48}$$

Next, [d9] noting that we will have

$$\lambda'_\infty = u_{C_0|G_0}(\lambda_\infty),$$

it will suffice to [d10] check

$$\lambda'_\infty = \mu\lambda_\infty \tag{49}$$

it will be obvious that λ'_∞ commutes with

$$\sigma' = u(\sigma) = \eta_0\sigma$$

since σ and $\eta_0 \in M$ commute with it. Thus to construct $u_{C|G}$, the essential checks are (47) and (49) — moreover once (47) is proved, the preceding calculations leading to (38) are justified (at least where they make sense, i.e., for $u_{C|G}$ and $\lambda \in M$), 44

[scan 46]

so (49) will indeed be verified.

We [d1] have

$$\rho'^3 = (\zeta|\xi\rho(\zeta|\xi)\rho^2(\zeta|\xi))\rho^3 = \zeta|\xi\rho(\zeta|\xi)\rho^2(\zeta|\xi)\,\omega$$
$$\sigma'^2 = (\eta_0\sigma(\eta_0))\sigma^2 = (\eta_0\sigma(\eta_0))\omega$$

so [d3] formulas (47) reduce to:

$$\zeta|\xi\rho(\zeta|\xi)\rho^2(\zeta|\xi) = 1, \qquad \eta_0\sigma(\eta_0) = 1 \tag{50}$$

i.e., additively

$$\zeta|\xi + \rho(\zeta|\xi) + \rho^2(\zeta|\xi) = 0, \qquad \eta_0 + \sigma(\eta_0) = 0.$$

whose verification is trivial, given that

$$\rho_{\underline{M}}^3 = \sigma_{\underline{M}}^2 = \mathrm{id}_{\underline{M}}, \qquad (1 + \rho_{\underline{M}} + \rho_{\underline{M}}^2) = 0_{\underline{M}}.$$

We have thus indeed constructed a homomorphism [d5]

$$u_{C_0^+|G_0^+} : \quad C_0^+|G_0^+ \longrightarrow \underline{C}_0^+(S_0)|\underline{G}_0^+(S_0) \ ,$$

and it remains to check (41) and (42).

For (41), we have already shown it at the level of the existence of a $u_{C_0|G_0}$ [i1] — it amounts to proving

$$\big(\quad u_{C_0|G_0}(\lambda_0) = \mu\lambda_0, \quad u_{C_0|G_0}(\lambda_1) = \mu\lambda_1$$

I will all the same redo the verification, to be sure.

$$\varepsilon_0' = u_{C_0|G_0}(\underbrace{\varepsilon_0}_{\sigma\rho}) = u_{C_0|G_0}(\sigma)u_{C_0|G_0}(\rho) = \eta_0\omega^{\nu_2}\sigma\zeta|\xi\rho = \eta_0\omega^{\nu_2}\sigma(\zeta|\xi)\sigma\rho$$
$$= \eta_0\sigma(\zeta|\xi)\omega^{\nu_2}\varepsilon_0$$

[scan 47]

[p. 671]

I claim that

$$\varepsilon_0' = \varepsilon_0^{(\mu)} \quad \text{i.e.} \quad \eta_0\sigma(\zeta|\xi)\omega^{(\nu_2)} = \underbrace{\varepsilon_0^{(\mu-1)}}_{l_0^\nu} \quad \text{where } \mu - 1 = 2\nu, \quad \text{i.e.}$$

$$\eta_0\sigma(\zeta|\xi)\omega^{\nu_2} = l_0^{(\nu)} \quad \text{where } \nu = 2\nu' - |+\nu_2 \quad \text{i.e.}$$

$$\eta_0\sigma(\zeta|\xi) = \underbrace{l_0^{(2\nu')}}_{\lambda_0^{2\nu'}} \underbrace{(\omega l_0)^{(-\nu_2)}|(\omega l_0^{(-\nu_2)})}_{\lambda_0^{-\nu_2}} = \underbrace{\lambda_0^{(2\nu'-|+\nu_2)}}_{\lambda_0^\nu} \quad \text{i.e.}$$

$$\eta_0\sigma(\zeta|\xi) = \lambda_0^{(\nu)}$$

i.e., applying σ and noting that $\sigma(\eta_0) = \eta_0^{-1}$, $\sigma^2(\zeta|\xi) = \zeta|\xi$, $\sigma(\lambda_0) = \lambda_1$,

$$\eta_0^{-1}\zeta|\xi = \lambda_1(\nu) \quad \text{i.e. finally } \zeta|\xi = \eta_0\lambda_1(\nu)|\lambda_1^{(\nu)} \quad \text{or}$$

$$\zeta|\xi = \eta_0 + \nu\lambda_1 \quad \text{(written additively)}$$

which is true by hypothesis (cf. (31)).

We will then have ([d3] writing u instead of $u_{C_0|G_0}$ to simplify[i1])

$$u(\lambda_1) = u\rho(\lambda_0) = (\zeta|\xi\rho u)(\lambda_0) = \zeta|\xi\rho(u(\lambda_0)) = \zeta|\xi\rho(\lambda_0(\mu)) = \lambda_1(\mu)$$

OK.

It remains to check (42), which [d5] amounts[i2] to the commutativity of $u_{\underline{M}} = \mu\,\mathrm{id}_{\underline{M}}$ with $(\rho_{\underline{M}}, \rho'_{\underline{M}})$, $(\sigma_{\underline{M}}, \sigma'_{\underline{M}})$ — this means also that $\rho_{\underline{M}}$ and $\rho'_{\underline{M}}$ on the one hand, $\sigma_{\underline{M}}$ and $\sigma'_{\underline{M}}$ on the other hand, [d6]are equal, which[i3] is also obvious.

Thus, the group $\widetilde{Z}_{\rho,\sigma}$ is well and truly constructed — at least, as a scheme over $S_0 = \operatorname{Spec}\mathbb{Z}$, with morphisms of schemes

$$\begin{array}{l} \underline{\widetilde{Z}}_{\rho,\sigma} \xrightarrow{\nu'} G_a \\ \qquad\qquad \longrightarrow \\ \qquad\xrightarrow{\nu_2} \{0,1\}_{S_0} \\ \qquad\xrightarrow{\nu_3} \{0,1\}_{S_0} \end{array} \quad \Big| \quad \begin{array}{l} \text{whence } \mu = 4\nu' + 2 + \nu_2 : \quad \widetilde{Z}_{\rho,\sigma} \longrightarrow G_a \\ \qquad\qquad\qquad\qquad\qquad\quad \searrow \uparrow \\ \qquad\qquad\qquad\qquad\qquad\quad\ G_m \\ \varepsilon_2, \varepsilon_3 : \quad \widetilde{Z}_{\rho,\sigma} \Longrightarrow \mu_{S_0} = \{\pm 1\}_{S_0} \end{array} \tag{51}$$

[scan 48]

and a morphism of d1 presheaves i1 over S_0

$$\begin{aligned} \widetilde{\underline{Z}}_{\rho,\sigma} &\longrightarrow \underline{\mathrm{Aut}}_{\mathrm{gr}}(\underline{C}^+|\underline{G}^+), \\ \underline{u} &\longmapsto u \end{aligned} \tag{52}$$

giving rise to a morphism

$$\begin{aligned} \widetilde{\underline{Z}}_{\rho,\sigma} &\longrightarrow \underline{\mathrm{Aut}}_{\mathrm{gr}}(\underline{C}^+|\underline{G}^+) \times \mathbf{G}_{\mathrm{m}} \times \mu_{S_0} \times \mu_{S_0} \\ \underline{u} &\longmapsto u, \mu(\underline{u}), \varepsilon_2(\underline{u}), \varepsilon_3(\underline{u}) \end{aligned} \tag{53}$$

— calculations already done thirty-six times in various contexts should show that this morphism (which is monomorphic ? in characteristic $\neq 2, 3$) is a morphism of groups, for a suitable group|groups structure on $\widetilde{\underline{Z}}_{\rho,\sigma}$, uniquely determined (since it is so in characteristic $\neq 2, 3$, and we conclude by reason of schematic density). We will have d2

$$1 \longrightarrow \widetilde{\underline{Z}}^{+0}_{\rho,\sigma} \longrightarrow \widetilde{\underline{Z}}_{\rho,\sigma} \longrightarrow \mathbf{G}_{\mathrm{m}} \times \mu_{S_0} \times \mu_{S_0} \longrightarrow 1 \tag{54}$$

m1464

Marginal note. m1464 a bit cavalier, since

$$\underline{Z}_{\rho,\sigma} \longrightarrow \mathbf{G}_{\mathrm{m}} \times \mu_{S_0} \times \mu_{S_0}$$

is not an epimorphism, because

$$\begin{aligned} \underline{M} \times \underline{M} &\longrightarrow \underline{M} \\ (\alpha_0, \beta_0) &\longmapsto (1 - \rho_{\underline{M}})\alpha_0 - | + (1 - \sigma_{\underline{M}})\beta_0 \end{aligned}$$

is not epimorphic — where there is a swindle in characteristic 3 — cf. below…

making explicit

$$\begin{array}{c} \underline{\widetilde{Z}}^{+0}_{\rho,\sigma} \underset{\text{subgroup scheme}}{\subset} \underline{M}\times\underline{M}\times\mathbf{G}_{\mathrm{a}} \\ \| \\ \left\{(\alpha_0,\beta_0,\nu')\,\middle|\,\begin{array}{c} 4\nu'=0 \\ (1+\rho_{\underline{M}})\alpha_0=(1-\sigma_{\underline{M}})\beta_0+2\nu'\lambda_1 \end{array}\right\} \end{array} \tag{55}$$

We will thus have

$$1 \longrightarrow \underline{\widetilde{Z}}^{+00}_{\rho,\sigma} \longrightarrow \underline{\widetilde{Z}}^{+0}_{\rho,\sigma} \longrightarrow {}_4\underline{\mathbf{G}_{\mathrm{a}}} \longrightarrow 1 \tag{56}$$

[scan 51]

[p. 673]

3. The groups [d1] $\mathbb{O}_N^*$.

We are going to introduce an auxiliary construction, by defining a group scheme which corresponds to the datum of quantities $\mu \in \Gamma\mathbf{G}_{\mathrm{m}}$, $\nu', \nu'' \in \Gamma\mathbf{G}_{\mathrm{a}}$, $\nu_2, \nu_3 \in \Gamma\{0,1\}_{S_0}$, satisfying

$$\mu = 4\nu' - 2\nu_2 + 1 = 6\nu'' - 2\nu_3 + 1, \qquad 2\nu' - \nu_2 = 3\nu'' - \nu_3. \tag{63}$$

In general, let $N \in \mathbb{N}^*$[i1] be a fixed natural[i2] integer (the case which interests us for what follows is $N = 12$), and let us consider the scheme in groups, $\mathbb{O}_N$[i3] over $\mathbb{Z}$ associated to the extension of discrete groups [d2]

$$1 \longrightarrow \mathbb{Z} \xrightarrow{N} \mathbb{Z} \longrightarrow \mathbb{Z}/N\mathbb{Z} \longrightarrow 1 \tag{64}$$

which fits into an exact sequence

$$1 \longrightarrow \mathbf{E}^1\vert\mathbb{E}^1 \xrightarrow{i} \mathbb{O}_N \longrightarrow (\mathbb{Z}/N\mathbb{Z})_{S_0} \longrightarrow 1. \tag{65}$$

Let us recall the [d3] simple construction

$$\mathbb{O}_N = (\mathbb{Z})_{S_0} \underset{(N\mathbb{Z})}{\wedge} \underline{N\mathbb{Z}}. \tag{66}$$

[d4] I say that there is in|on $\mathbb{O}_N$ a unique Ring structure, whose addition is the abelian[i4] group structure already envisaged, and where multiplication is obtained as follows: A section of $\mathbb{O}_N$ is [d5] of the form [d6] $n + N[\lambda]$, with the rules of calculation

$$\begin{cases} \text{a)} & (n + N[\lambda]) + (n' + N[\lambda']) = (n + n') + N[\lambda + \lambda'] \\ \text{b)} & n + N[\lambda] = n' + N[\lambda'] \iff n + N\lambda = n' + N\lambda' \text{ in } \Gamma\mathbf{G}_{\mathrm{a}}. \end{cases} \tag{67}$$

[p. 674]

the image of $\underline{J}$ in it is an ideal ...

We do find a ring structure on $\underline{A}_{[N]}$, and an exact sequence d1

$$1 \longrightarrow \underline{J} \longrightarrow \underline{A}_{[N]} \longrightarrow B_{S_0} \longrightarrow 1 \tag{71}$$

where $\underline{A}_{[N]} - B_{S_0}$ is a morphism of ring schemes. Passing to the multiplicative groups d2, we find an exact sequence

$$\begin{array}{ccccccccc} 1 & \longrightarrow & (1+\underline{J})^* & \longrightarrow & A^*_{[N]} & \longrightarrow & (B_{S_0})^* & \longrightarrow & 1 \\ & & & & & & \| & & \\ & & & & & & (B^*)_{S_0} & & \end{array} \tag{72}$$

where for $A^*_{[N]}$, $(B_{S_0})^{*|'}$ and B^*, the $*$ denotes the passage to the multiplicative subgroup and where $(1+\underline{J})^*$ has the analogous meaning

$$(1+\underline{J})^* \subset \mid \subseteq 1+\underline{J}$$

$$\| \tag{73}$$

$$\{(1+\lambda) \mid 1+\lambda \text{ invertible in } \underline{A}\}$$

$$\wr$$

$$\{(\lambda,\lambda') \in \underline{J}\times\underline{J} \mid \lambda+\lambda'+\lambda\lambda' = 0 \text{ in } \underline{J}\}.$$

Thus we will have, in the special case $A=\mathbb{Z}$, $J=N\mathbb{Z}$

$$1 \longrightarrow (\underline{1+N\mathbb{Z}})^* \longrightarrow \mathbb{O}_N^* \longrightarrow (\mathbb{Z}/N\mathbb{Z})^*_{S_0} \longrightarrow 1 \tag{74}$$

where the kernel 52

[scan 55]

[p. 675]

which is a group scheme (not flat if $N \neq 1$) which is zero over $\operatorname{Spec} \mathbb{Z}[1/N]$, and d1 the fibers at the $p \mid N$ are $\simeq \mathbf{G}_a$.

I realize now that it is a clumsy move to leave the group $\mathbb{O}_N^*$, which is perfect of its kind, to refer to $\mathbf{G}_m$.

I am going to examine in particular

$$1 \longrightarrow (1 + 12\mathbb{Z})^* \longrightarrow \mathbb{O}_{12}^* \longrightarrow (\mathbb{Z}/12\mathbb{Z})^*_{S_0} \longrightarrow 1. \tag{78}$$

Let us note that d2

$$(\mathbb{Z}/12\mathbb{Z})^* \simeq (\mathbb{Z}/4\mathbb{Z})^* \times (\mathbb{Z}/6\mathbb{Z})^* \simeq \mu \times \mu.$$

Thus (78) takes the form d3

$$1 \longrightarrow (1 + 12\mathbb{Z})^* \longrightarrow \mathbb{O}_{12}^* \xrightarrow{\varepsilon_2 \times \varepsilon_3} \mu \times \mu \longrightarrow 1 \tag{79}$$

The quantities $\nu_{2|3}$ ν_3 are also morphisms[i1] defined on $\mathbb{O}_{12}^*$

$$\mathbb{O}_{12}^* \xrightarrow{(\nu_2,\nu_3)} \{0,1\}_{S_0} \times \{0,1\}_{S_0} \tag{80}$$

they are the composites

$$\mathbb{O}_{12}^* \xrightarrow{(\varepsilon_2,\varepsilon_3)} \mu \times \mu \xrightarrow{\sim} \{0,1\}_{S_0} \times \{0,1\}_{S_0} \tag{81}$$

$$\text{deduced from} \quad \begin{array}{ccc} 1 & \mapsto & 0 \\ -1 & \mapsto & 1 \end{array}$$

[scan 56]
d1

and they are group homomorphisms (for addition modulo 2 on $\{0,1\}_{S_0}$.
We also have $\varepsilon_2 = (-1)^{\nu_2} = 1 - 2\nu_2, \quad \varepsilon_3 = (-1)^{\nu_3} = 1 - 2\nu_3$[i1]
The "four cases of signs" in $(\mathbb{Z}/12\mathbb{Z})^*$ are given in the table

$\varepsilon_3 \backslash \varepsilon_2$	$+1$ i.e. $\nu_2 = 0$	-1 i.e. $\nu_2 = 1$
$+1$ i.e. $\nu_3 = 0$	1	$+5$
-1 i.e. $\nu_3 = 1$	-5	-1

(82)

thus we find a set-theoretic section of (79) by taking the sections of $\underline{\mathbb{O}}_{12}^*$ of the form

$$\underline{\mu}_0 = (-5)^{\nu_2}(+5)^{\nu_3} \begin{cases} \equiv (-1)^{\nu_3} & (6) \\ \equiv (-1)^{\nu_2} & (4) \end{cases} \tag{83}$$

Thus a general section of $\mathbb{O}_{12}^*$ is written

$$\underline{\mu} = \underbrace{(-5)^{\nu_2}(+5)^{\nu_3}}_{\mu_0} + 12[\dagger\nu_0|\nu_0] \tag{84}$$

where

$$\begin{cases} (\nu_2, \nu_3) \in \Gamma(\{0,1\}_{S_0} \times \{0,1\}_{S_0}) \\ \lambda_0 \in \Gamma(\mathbf{G}_a). \end{cases}$$

d3 Let us note that we have[i3]

$$5^{\nu_3} = 1 + 4\nu_3$$

and

$$(-5)^{\nu_2} = \left[\begin{array}{r} (-1)^{\nu_2} 5^{\nu_2} = (1-2\nu_2)(1+4\nu_2) \\ = 1 + 2\nu_2 - 8\nu_2^2 \end{array}\right] = 1 - 6\nu_2$$

N.B. $\nu_2 = \nu_2^2$

thus

$$\underline{\mu}_0 = (1+4\nu_3)(1-6\nu_2) \tag{85}$$

$$= 1 + 4\nu_3 - 6\nu_2 - 24\nu_2\nu_3$$

[p. 676]

If we have ((84) and (85))

$$\underline{\mu} = \underline{\mu}_0 + 12[\dagger\nu_0|\nu_0] = 1 + 4\nu_3 - 6\nu_2 + 12(\nu_0 - 2\nu_2\nu_3)$$

we conclude from this (by considering the congruences modulo 4)

$$\mu = 1 - 2\nu_2 + 4\underbrace{[\nu_3 - \nu_2 - |+3\nu_2\nu_3 + 3\nu_0]}_{\nu'} \tag{86}$$

and by|for congruence|congruences modulo 6

$$\mu = 1 - 2\nu_3 + 6\underbrace{[\nu_3 - \nu_2 - 2\nu_2\nu_3 + 2\nu_0]}_{\nu''}, \tag{87}$$

where the underline in $\underline{\mu}$ denotes the section in $\mathbb{O}_{12}^*$, the non-underlined μ[i2] [d2] the[i3] corresponding|corresponding[i4] section of $\mathbf{G}_m = \mathbb{O}_1^*$. We will indeed have

$$\begin{aligned} 2\nu' - \nu_2 &= 2\nu_3 - 3\nu_2 - 6\nu_2\nu_3 + 6\nu_0 \qquad '' \\ 3\nu'' - \nu_3 &= 2\nu_3 - 3\nu_2 - 6\nu_2\nu_3 + 6\nu_0 \end{aligned}$$

In summary

Proposition Let us introduce on the smooth group|group scheme[i5] $\mathbb{O}_{12}^*$ the functions $\underline{\mu} \mapsto$[i6] $\nu_2|\xi_2, \nu_3$, [d3] (with values in $\{0,1\}_{S_0} \subset \mathbf{G}_a = \mathbb{O}_1$), ν', ν'' [d4] (with values in $\mathbb{O}_1|\mathbf{G}_a$) and μ (with values in ${\mathbf{G}_m}^* = \mathbb{O}_1^* \subset \mathbb{O}_1$) defined by the conditions

$$\begin{cases} \mu = & \text{canonical image of } \underline{\mu} \text{ in } \mathbb{O}_1^* \text{ under} \\ & \text{the homomorphism of Groups } \mathbb{O}_N^* \longrightarrow | - \mathbb{O}_1^* \\ (-1)^{\nu_2} & \\ \qquad = & \text{canonical image of } \underline{\mu} \text{ in } (\mathbb{Z}/4\mathbb{Z})_{S_0}^* \\ (-1)^{\nu_3} = & \text{_____} \quad (\mathbb{Z}/6\mathbb{Z})_{S_0}^* \end{cases} \tag{88}$$

whence

$$\begin{cases} \underline{\mu} = (-5)^{\nu_2}(+5)^{\nu_3} + 12[\nu_0|\lambda_0] \\ \quad = (1 + 4\nu_3)(1 - 6\nu_2) + 12\nu_0 \\ \quad = 1 + 4\nu_3 - 6\nu_2 + 12[\nu_0 - 2\nu_2\nu_3] \end{cases} \tag{89}$$

[p. 677]

4. The groups|The group [d1] $N_{\rho,\sigma}$, [d2]and the[i1] exact sequence

$$1 \to N^{0+}_{\rho,\sigma} \to N_{\rho,\sigma} \to \mathbb{O}^*_{12} \to 1.$$

Relations with $\mathrm{Gl}(2, \mathbb{Z}/12\mathbb{Z})$.
We define it as embedded in $\mathbb{O}^*_{12} \times \underline{M} \times \underline{M}$:

$$(94) \quad \begin{matrix} \widetilde{Z}_{\rho,\sigma} \subset \mathbb{O}^*_{12} \times \underline{M} \times \underline{M} \\ \prime\prime \\ \{(\underline{\mu}, \alpha_0, \beta_0) \mid (1 - \rho_{\underline{M}})(\alpha_0) - (1 - \sigma_{\underline{M}})(\beta_0) = 3\nu''(\underline{\mu})\lambda_1\} \end{matrix}$$

Note that we have

$$(95) \qquad (1 - \rho_{\underline{M}})(\underbrace{\lambda_1 - \lambda_0}) = 3\lambda_1$$

so the cocycle relation in (72|77) thus takes the form

$$(96) \qquad (1 - \rho_{\underline{M}})(\alpha_0 - \nu''(\lambda_1 - \lambda_0)) - (1 - \sigma_{\underline{M}})(\beta_0) = 0$$

I shall assume again that we have a natural group structure on $\widetilde{Z}_{\rho,\sigma}$, for which the projection $\widetilde{Z}_{\rho,\sigma} \to \mathbb{O}^*_{12}$ is a group homomorphism. We now find an exact sequence
(97)

$$1 \longrightarrow \widetilde{Z}^{+0}_{\rho,\sigma} \longrightarrow \widetilde{Z}_{\rho,\sigma} \longrightarrow \mathbb{O}^*_{12} \longrightarrow 1$$

where

$$(98) \quad \begin{matrix} \widetilde{Z}^{+0}_{\rho,\sigma} \overset{\text{dfn}}{=} \mathrm{Ker}(\widetilde{Z}_{\rho,\sigma} - \mathbb{O}^*_{12}) \\ \wr\mid \\ \{(\alpha_0, \beta_0) \mid (1 - \rho_{\underline{M}})(\alpha_0) - (1 - \sigma_{\underline{M}})(\beta_0) = 0\} \end{matrix}$$

This group scheme is smooth in characteristic $\neq 3$, but not in characteristic 3, where its dimension goes

[scan 60]

from relative dimension 2 to relative dimension 3. This fact of an exceptional fiber of larger dimension cannot, it seems to me, be eliminated by a dodge, [d1] by introducing [d2] some ad-hoc definitions for a "better" group $\widetilde{Z}_{\rho,\sigma}$: there are "more" automorphisms of $\underline{\mathcal{G}}_k$ (for k an algebraically closed field), having the properties envisaged, if k is of characteristic 3, than in the other cases of characteristic.

However, it seems to me that we can construct a subgroup scheme [d3] of $\widetilde{Z}_{\rho,\sigma}$, which I feel like denoting $N_{\rho,\sigma}$, which is smooth over $S_0 = \mathrm{Spec}(\mathbb{Z})$ and coincides with $\widetilde{Z}_{\rho,\sigma}$ over [d4] $S_{0,3|2} = \mathrm{Spec}\,\mathbb{Z}[1/3] = S_0 \setminus \{3\}$. To describe it, I note that in the loop equation(96)[i1], the [d5]left-hand[i2] side is automatically|automatic in [d6]the submodule of $\underline{M}$ corresponding[i3] to the congruence

$$c_0 + c_1 \equiv 0 \ (3) \qquad (\text{cf } 62)$$

and if we introduce the corresponding sub-[d7]$\mathbb{Z}$-module[i4] of index

[p. 678]

3, M_0 of M

$$(99) \qquad \begin{array}{l} M_0 \subset M \\ '' \text{ dfn} \\ \{c_0\lambda_0 + c_1\lambda_1 \mid c_0 + c_1 \equiv 0 \ (3)\}, \end{array}$$

whence a vector bundle $\underline{M}_0$ over S_0 — we in fact have a morphism of schemes

(100)

$$\widetilde{Z}_{\rho,\sigma} \longrightarrow \underline{M}_0$$

$$(\underline{\mu}, \alpha_0, \beta_0) \longmapsto (1-\rho_{\underline{M}})(\underbrace{\alpha_0 + \nu''(\lambda_1 - \lambda_0)}_{\widetilde{\alpha}_0}) + (1-\sigma_{\underline{M}})(\beta_0)$$

which we can make explicit as follows: we have a homomorphism of $\underline{\mathbb{Z}}$-modules
(101)

$$M \times M \times \mathbb{Z} \longrightarrow M_0$$

$$(\alpha_0, \beta_0, \nu'') \longmapsto (1-\rho_M)(\alpha_0 + \nu''(\lambda_1 - \lambda_0)) + (1-\sigma_M)(\beta_0)$$

whence a homomorphism for the corresponding module schemes
(102)

$$\underline{M} \times \underline{M} \times \underbrace{\underline{\mathbb{Z}}}_{\widetilde{\mathbb{G}_a}} \longrightarrow \underline{M_0}$$

which we compose with
(103)

$$\widetilde{Z}_{\rho,\sigma} \longrightarrow \underline{M} \times \underline{M} \times \underline{\mathbb{Z}}$$

$$(\underline{\mu}, \alpha_0, \beta_0) \longmapsto (\alpha_0, \beta_0, \nu''(\mu))$$

We can then consider the cocycle equation (96) as an equation in $\underline{M}_0$ — it thus becomes stricter,

[scan 62]

whence a closed subscheme of $\widetilde{Z}_{\rho,\sigma}$,

(104) $N''_{\rho,\sigma} \subset \widetilde{Z}_{\rho,\sigma}$

$\{(\underline{\mu}, \alpha_0, \beta_0) \in \widetilde{Z}_{\rho,\sigma} \mid$ the loop equation (96) valid in $\underline{M}_0\}$.

Let us then consider the morphism

$$N_{\rho,\sigma} \longrightarrow \mathbb{O}_{12}^{*}$$

m1481

Marginal note. [m1481] N.B. The group $N_{\rho,\sigma}$ should also be denotable by $M|\widetilde{N}_{\rho,\sigma}[0]$, unless I am mistaken it Or|In rather it would be $(M^{\sharp|b}_{\rho,\sigma}/M_{\rho})[0]$ [d2] with the notations of § 49, [d3]VI[i2]

It is clear that this morphism is still an epimorphism, the fiber over a $\underline{\mu} = (\nu_2, \nu_3, \nu_0)$ being made up of the $(\alpha_0, \beta_0) \in \Gamma\, \underline{M} \times \underline{M}$ satisfying (96) in M_0, [d4] is identified|being identified with the scheme of[i3] $(\tilde{\alpha}_0, \beta_0)$ satisfying the linear equation

in $\tilde{\alpha}_0, \beta_0$

$$(105) \qquad (1 - \rho_{\underline{M}})(\tilde{\alpha}_0) - (1 - \sigma_{\underline{M}})(\beta_0) = 0 \qquad \text{in } \underline{M}_0.$$

Now the homomorphism of Modules

(106)

$$\begin{cases} \underline{M} \times \underline{M} \longrightarrow \underline{M}_0 \\ (\tilde{\alpha}_0, \beta_0) \longmapsto (1 - \rho_{\underline{M}})(\tilde{\alpha}_0) - (1 - \sigma_{\underline{M}})(\beta_0) \end{cases}$$

is a smooth epimorphism — being associated to a corresponding homomorphism

$$M \times M \longrightarrow M_0$$

which is now|manifestly an epimorphism. Thus [d8] $N_{\rho,\sigma}$ is smooth over S_0. [d9] Being a closed subscheme of $\widetilde{Z}_{\rho,\sigma}$

[scan 63]

[p. 679]

which coincides with it over $S_0 \setminus \{3\}$, it follows that it is the schematic closure that|by

$$N_{\rho,\sigma} = \widetilde{Z}_{\rho,\sigma}|(\mathrm{Spec}(\mathbb{Z}) \setminus \{3\}), \tag{107}$$
(schematic closure)

which implies that it is also a subgroup scheme.

Perhaps this is the moment to look a little more closely at the sub-$\mathbb{Z}$-module M_0 of M,

$$\begin{aligned} M_0 &= \mathbb{Z}(\lambda_1 - \lambda_0) + \mathbb{Z}(3\lambda_1) \\ &= \mathbb{Z}\underbrace{(\lambda_1 - \lambda_0)}_{\delta} + \mathbb{Z}(1-\rho_M)\underbrace{(\lambda_1 - \lambda_0)}_{\delta} \\ &= \mathbb{Z}(\delta, |) \oplus \mathbb{Z}(1-\rho_M)(\delta) \\ &= \mathbb{Z}\delta + \mathbb{Z}\rho_M\delta. \end{aligned} \tag{108}$$

Note that M_0 is stable under ρ, σ[i1], in general by construction, for $\forall\ x \in M$, we

$$\begin{aligned} x &\equiv \rho_M(x) \quad (M_0) \quad (\text{i.e. } (1-\rho_M)(x) \in M_0) \\ x &\equiv \sigma_M(x) \quad (M_0) \quad (1-\sigma_M)(x) \in M_0. \end{aligned} \tag{109}$$

d1

It is of course also stable under $\tau_M = -\mathrm{id}_M$.

Thus M_0 is normalized by $\mathcal{G}$, hence as a subgroup of $\mathcal{G}$)[i2] normal in $\mathcal{G}$. [d2]It therefore corresponds to[i3] a normal subgroup of $\mathcal{G}_0 = \mathrm{Gl}(2, \mathbb{Z})$,

[scan 64]

containing $[\Pi_0, \Pi_0]$, of index 3 in Π_0. I presume that it [d1] contains the congruence subgroup relative to 12 — i.e. that it corresponds to a normal[i1] subgroup of $\mathrm{Sl}(2, \mathbb{Z}/12\mathbb{Z})$. It is of index $3.12 = 36$ in $\mathrm{Sl}(2, \mathbb{Z})$, [d2], [d3] that

$$\mathrm{Sl}(2, \mathbb{Z}/12\mathbb{Z}) \simeq \underbrace{\mathrm{Sl}(2, \mathbb{Z}/4\mathbb{Z})}_{48} \times \underbrace{\mathrm{Sl}(2, \mathbb{Z}/3\mathbb{Z})}_{24}$$

— it would therefore be a subgroup of order 32 of $\mathrm{Sl}(2, \mathbb{Z}/12\mathbb{Z})$, it is obviously the normal subgroup[i2] generated by the elements [d4] the image of [d5],

$$\begin{cases} (\sigma(\rho)\rho^{-1})^3 = [\lambda_0, \lambda_1], \text{ or } [\sigma_\infty, \lambda_\infty] \\ \text{cf. (7)} \\ \delta \overset{\text{dfn}}{=} \lambda_1 \lambda_0^{-1} \\ \rho(\delta) \end{cases}$$

or again the normal[i3] subgroup generated by the single element [d7]

$$(110) \qquad \begin{cases} \delta = \lambda_1 \lambda_0^{-1} = \ell_1 \ell_0^{-1} = \begin{pmatrix} 1 & 0 \\ 2 & 1 \end{pmatrix} \begin{pmatrix} 1 & +2 \\ 0 & 1 \end{pmatrix} \\ \quad = \begin{pmatrix} 1 & +2 \\ 2 & 5 \end{pmatrix} \end{cases}$$

The question is therefore whether this normal subgroup of $\mathrm{Sl}(2, \mathbb{Z}/12\mathbb{Z})$ is well and truly of order 32, hence of index 36 — its order could be larger, its index smaller. To begin with, what is the order of δ?

[scan 66]

that [d1] the subgroup under consideration of $\Pi_0 \subset \mathrm{Sl}(2,\mathbb{Z})$, of index 3 in Π_0,[i1] is the inverse image of this preceding subgroup [d2] of $\mathrm{Sl}(2,\mathbb{Z}/12\mathbb{Z})$.

Let us sum up the results obtained:

Proposition Let us consider in $\mathcal{G}_0^+ = \mathrm{Sl}(2,\mathbb{Z})$ the tower of invariant subgroups (even in $\mathcal{G}_0$)

(114)

$$\mathcal{G}_0^+ \xleftarrow{6} \Pi = \Pi[2] \xleftarrow{2} \Pi_0 \xleftarrow{3} \Pi_{00}\ (\supset [\Pi_0, \Pi_0])$$

$\Pi = \Pi[2]$: $\overset{\text{dfn}}{=}$ $\{u \in \mathcal{G}_0^+ \mid u \equiv 1\ (2)\}$ — $(i)|(1)$

Π_0: $=$ Subgroup generated by the $-\ell_i = \lambda_i$

$\Pi_{00}\ (\supset [\Pi_0, \Pi_0])$: $=$ Subgroup invariant generated by $\lambda_1\lambda_0^{-1} = \ell_1\ell_0^{-1}$

Let us consider on the other hand the quotient group

(115)
$$\mathrm{Sl}(2,\mathbb{Z}/12\mathbb{Z}) \simeq \mathcal{G}_0^+ / \underbrace{\Pi[12]}_{\simeq\{u\in\mathcal{G}_0^+ \mid u\equiv 1\ (12)\}}$$
$$\simeq$$
$$\mathrm{Sl}(2,\mathbb{Z}/4\mathbb{Z}) \times \mathrm{Sl}(2,\mathbb{Z}/3\mathbb{Z}),$$

and the tower of the following subgroups

$$(116)\qquad \begin{cases} & H = \mathrm{Sl}(2,\mathbb{Z}/4\mathbb{Z}) \times \mathrm{Sl}(2,\mathbb{Z}/3\mathbb{Z}) & \text{order } 48\times 24 \\ 6\cup & \cup & \\ & \Pi^{\bullet} = \mathfrak{sl}(2,\mathbb{F}_2) \times \mathrm{Sl}(2,\mathbb{Z}/3\mathbb{Z}) & \text{order } 8\times 24 \\ 2\cup & \cup & \\ & \Pi^{\bullet}_0 = \mathfrak{sl}(2,\mathbb{F}_2)' \times \mathrm{Sl}(2,\mathbb{Z}/3\mathbb{Z}) & \text{order } 4\times 24 \\ 3\cup & \cup & \\ & \Pi^{\bullet}_{00} = \mathfrak{sl}(2,\mathbb{F}_2)' \times \underbrace{\mathrm{Syl}_2}_{\simeq D_4} & \text{order } 4\times 8, \end{cases}$$

m1482

Marginal note. m1482 N.B. $(\mathcal{G}_0^+)_{\mathrm{ab}} \simeq \mathbb{Z}/12\mathbb{Z}$ is identified with a d8 quotient of $H/\Pi^{\bullet}_{00}$ by a subgroup (116) of order 3 — that is again the subgroup generated by the element $(-\dot{\rho}, 1)$ of

$$\underbrace{\mathrm{Sl}(2,\mathbb{Z}/4\mathbb{Z})/\mathfrak{sl}(2,\mathbb{F}_2)'}_{\mathcal{G}_0^+/\Pi_0} \times \mathrm{Sl}(2,\mathbb{Z}/3\mathbb{Z})/\mathrm{Syl}_2.$$

Where d9

$$(117)\qquad \begin{cases} \text{a)} & \mathfrak{sl}(2,\mathbb{F}_2) \simeq \\ & \mathrm{Ker}(\mathrm{Sl}(2,\mathbb{Z}/4\mathbb{Z}) \longrightarrow \mathrm{Sl}(2,\mathbb{Z}/2\mathbb{Z})) \\ & \qquad\qquad \text{normal subgroup } \simeq \\ & \qquad\qquad \mathbb{F}_2\times\mathbb{F}_2 \text{ ; whose three elements } \neq 0 \\ & \qquad\qquad \text{are } \dot{\lambda}_0, \dot{\lambda}_1, \dot{\lambda}_\infty \text{ (images} \\ \text{b)} & \mathfrak{sl}(2,\mathbb{F}_2)' \subset \mathfrak{sl}(2,\mathbb{F}_2), \quad \text{in } \mathrm{Sl}(2,\mathbb{Z}/4\mathbb{Z})) \text{ — it is} \\ & \qquad\qquad \text{a complement to its} \\ & \qquad\qquad \text{Lie subalgebra } \mu \simeq \mathbb{F}_2 \text{ of matrices} \\ & \qquad\qquad \text{constant}|\text{scalar} \\ \text{c)} & \mathrm{Syl}_2 \qquad \subset \mathrm{Sl}(2,\mathbb{Z}/3\mathbb{Z}), \\ & \quad \| \\ & \mathrm{Ker}(\mathrm{Sl}(2,\mathbb{Z}/3\mathbb{Z}) \to \mathcal{G}_3^+) \\ & \text{Sylow subgroup, of order 8} \\ & \text{(which is normal)} \end{cases}$$

[scan 67]

[p. 681]

This being so, the tower of subgroups (114) is the inverse image of the tower (116).

d1 To satisfy my conscience, I am going to take up the preceding sketch|sketch of a proof again. We note that the homomorphism $\mathcal{G}_0^+ \longrightarrow H$ maps the groups appearing in (114) into those of (116) — for Π and Π_0, we have in fact known for a while that they are the inverse images of $\Pi^\bullet$, $\Pi_0^\bullet$! $*| \leftarrow$ (For this, it was enough|would be enough to examine $\mathrm{Sl}(2, \mathbb{Z}/4\mathbb{Z})$, instead of $\mathrm{Sl}(2, \mathbb{Z}/12\mathbb{Z})$ …).

Thus the inverse image of $\Pi_{00}^\bullet$ in $\mathcal{G}_0^+$ contains Π_{00}. As both are of index 36, these two groups are equal, q.e.d. (The same argument could be applied to the case of Π_0, $\Pi_0^\bullet$ …)

Corollary The canonical homomorphism

$$\mathcal{G}_0^* = \mathrm{Gl}(2, \mathbb{Z}) \rightarrow \mathrm{Gl}(2, \mathbb{Z}/12\mathbb{Z})/(\Pi_{00}^\bullet = \mathfrak{sl}(2, \mathbb{F}_2)' \times \mathrm{Syl}_2)$$

factors through

$$\mathcal{G} = \mathrm{Gl}(2, \mathbb{Z})/[\Pi_0, \Pi_0]$$

studied in the present § 51, and the inverse image of $\Pi_{00}^\bullet$ is none other than the subgroup M_0 of (99) (108).

m1483

Marginal note. m1483 N.B. But $\mathcal{G}_0^{+|*} \longrightarrow$ Sl|Gl$(2, \mathbb{Z}/12\mathbb{Z})$ does not factor through $\mathcal{G}^{+|*}$, for if this were so $\Pi_0^{\bullet|\prime}$ would be a sub-quotient of $\Pi_0/[\Pi_0, \Pi_0]$ and hence would be commutative — now all we see two|therefore which are both.

[scan 68]

The preceding considerations make fairly natural|natural the consideration of the covering of order 3 of $U_{0,\overline{\mathbb{Q}}}$ [d1i1] corresponding to the subgroup Π_{00} of $\Pi_0 \simeq \Pi_1(U_{0,\overline{\mathbb{Q}}})$.

it is even a covering of $M_{1,1}$…

We check at once that it is a curve of genus 1 – if then we take it into our heads to work with $[\Pi_{0,0}, \Pi_{0,0}]$ instead of $[\Pi_0, \Pi_0]$, we find a group extension of $\Pi_0/[\Pi_0, \Pi_0] \simeq M$, by a group of rank 2 which is "elliptic", and on which M will operate in a highly nontrivial way – later on we would have to examine this action, and put it in relation with the action we have found, subordinate to the homomorphism

$$\mathrm{Sl}(2, \mathbb{Z})^\wedge \longrightarrow \mathrm{Sl}(2, \widehat{\mathbb{Z}}).$$

m1485

Marginal note. [m1485] it is an elliptic curve of invariant 0 (for it is equipped with an automorphism of order 3)

Apparatus for this scan

[scan 69]

[p. 682]

5) The groups $\underline{M}_{\rho,\sigma}$, $\underline{M}^\sharp_{\rho,\sigma}$ (via $\underline{N}_{\rho,\sigma}$).

To every $\ell \in \Gamma\underline{M}_0$ there corresponds an inner automorphism $\mathrm{int}(\ell)$, which is the identity on $\underline{M}_0$. We will have, tautologically

$$(118) \qquad \begin{cases} \mathrm{int}(\ell)(\rho) = \alpha_{0|\cdot}(\rho) \\ \mathrm{int}(\ell)(\sigma) = \beta(\sigma) \end{cases} \qquad \alpha = \beta = \ell$$

But [d1] will we for all that have the loop relation (relative to $\underline{\mu} = 1$ hence $\nu'' = 0$)

$$(1 - \rho_M)(\underbrace{\alpha}_{\ell}) = (1 - \sigma_M)(\underbrace{\beta}_{\ell}).$$

$$\underset{(*)|\alpha_1}{\text{i.e.}} \qquad \rho_M(\ell) = \sigma_M(\ell) \qquad ?$$

Setting again

$$(119) \qquad \ell = c_0\lambda_0 + c_1\lambda_1$$

[d2] the relation $(*)$ is written

$$c_0\lambda_1 + c_1 \underbrace{\lambda_\infty}_{-\lambda_0-\lambda_1} = c_0\lambda_1 + c_1\lambda_0$$

$$\text{i.e.} \qquad -c_1\lambda_0 + (c_0 - c_1)\lambda_1 = c_1\lambda_0 + c_0\lambda_1$$

i.e. $c_1 = 0$ i.e. $\ell = c_0\lambda_0$. Thus it is subject to the condition|conditions that we restrict ourselves to considering $\ell \in \Gamma\underline{L}_0^{\underline{M}_0|\underline{M}}\Rightarrow$; corresponding|corresponding

$$(120)\qquad \ell = c_0\lambda_0 \in \underline{L}_0^{\underline{M}} \overset{\text{dfn}}{=} \mathrm{Im}\Big(\begin{array}{l} \underline{\mathbb{Z}} \longrightarrow \underline{M}) \\ \simeq \\ \mathbb{G}_a \\ \ni \\ c_0 \longmapsto c_0\lambda_0 \end{array}$$

We have a [d5] diagram

$$(121)\qquad \begin{array}{ccc} \mathbb{G}_a \simeq \underline{L}_0^{\underline{M}_0|\underline{M}} & \longrightarrow & \underline{N}_{\rho,\sigma} \\ \downarrow & & \\ \underline{\mathcal{G}}^+ & & \end{array}$$

the image of

$$(127|122)\qquad \underline{L}_0^{\underline{M}_0|\underline{M}} \longrightarrow \underline{N}_{\rho,\sigma}$$

is invariant – the homomorphism (121) being in fact compatible with the action of $N_{\rho,\sigma}$ – via $\underline{\mu}$ on $\underline{L}_0^{M_0} \simeq \mathbb{G}_a$ (i.e. induced by the operation of $\underline{N}_{\rho,\sigma}$ of on!| the $\underline{\mathcal{G}}^+ \supset \underline{M} \supset \underline{L}_0^{\underline{M}}$), and [d1]the two[i1] operations of [d2] $\underline{L}_0^{\underline{M}}$ on $\underline{\mathcal{G}}^+$ deduced from (121) being identical|identical. Thus according to the general theory|theorem we find|will find a group scheme $\underline{M}_{\rho,\sigma}$ and a diagram of exact sequences

$$(123)\qquad \begin{array}{ccccccccc} 1 & \longrightarrow & \underline{L}_0^{\underline{M}} & \longrightarrow & \underline{N}_{\rho,\sigma} & \Longrightarrow & \overset{\text{dfn}}{=} \underline{N}_{\rho,\sigma}/\underline{L}_0^{\underline{M}} & & \\ & & \downarrow & & \downarrow & & \Vert & & \\ 1 & \longrightarrow & \underline{\mathcal{G}}^{+a|\alpha} & \longrightarrow & \underline{M}_{\rho,\sigma} & \Longrightarrow & \underline{\Gamma}_{\rho,\sigma} & \longrightarrow & 1 \end{array}$$

m1486

Marginal note. m1486 with the notations of § 49 VI, the group denoted here $\underline{M}_{\rho,\sigma}$ would probably be denoted $\underline{M}_{\rho,\sigma}/H_\rho|H_{\underline{\Pi}}$, and $\underline{M}^\sharp_{\rho,\sigma}$ would be $\underline{M}^\sharp_{\rho,\sigma}/H_\rho$ (loc. cit. 8°)

Replacing $\underline{\mathcal{G}}^+$ by $\underline{M}$, we likewise find $\underline{M}^\sharp_{\rho,\sigma}$, and

(124)
$$\begin{array}{ccccccccc} 1 & \longrightarrow & \underline{L}_0^M & \longrightarrow & \underline{N}_{\rho,\sigma} & \longrightarrow & \underline{\Gamma}_{\rho,\sigma} & \longrightarrow & 1 \\ & & \downarrow & & \downarrow & & \Vert & & \\ 1 & \longrightarrow & \underline{M} & \longrightarrow & \underline{M}^\sharp_{\rho,\sigma} & \longrightarrow & \underline{\Gamma}_{\rho,\sigma} & \longrightarrow & 1 \end{array}$$

,

moreover we have a homomorphism from (124) into (123) (compare § 49 VI 5°…), and

(125) $$M^\sharp_{\rho,\sigma} \subset M_{\rho,\sigma} \qquad \ldots$$

[scan 71]

[p. 683]

We must specify the structure of $\Gamma_{\rho,\sigma}$, noting that $L_0^M \subset N^{0+}_{\rho,\sigma}$, hence

(126|125) $$1 \longrightarrow \underline{\Gamma}^{0+}_{\rho,\sigma} \longrightarrow \underline{\Gamma}_{\rho,\sigma} \longrightarrow \underline{\mathbb{O}}^*_{12} \longrightarrow 1$$

with

(127) $$1 \longrightarrow \underline{L}_0^M \longrightarrow \underline{N}^{0+}_{\rho,\sigma} \longrightarrow \underline{\Gamma}^{0+}_{\rho,\sigma} \longrightarrow 1$$

Let us consider [d3]the[i1][d4]surjective homomorphism[i2] of $\mathbb{Z}$-modules

$$(128)\quad N^{0+}_{0,\sigma}|N^{0+}_{\rho,\sigma} = \mathrm{Ker}\Big(\begin{array}{c} M\times M \longrightarrow M_0) \\ \cap \\ M \end{array}$$

$$\mapsto$$

$$\Big(\underset{\|}{\alpha_0}\ ,\ \underset{\|}{\beta_0}\Big) \longrightarrow (1-\rho_M)(\alpha_0)-(1-\sigma_M)(\beta_0)$$

$$\underset{a_0\lambda_0+a_1\lambda_1}{\qquad\qquad}\qquad\qquad \underset{b_0\lambda_0+b_1\lambda_1}{\qquad\qquad}$$

kernel consisting of the (α_0,β_0) such that

$$\left.\begin{array}{l} c_0 \overset{\mathrm{dfn}}{=} a_0+a_1+(b_1-b_0)=0 \\ c_1 \overset{\mathrm{dfn}}{=} 2a_1-a_0-(b_1-b_0)=0 \end{array}\right| \text{cf. (61)}$$

[i5]

Let $\underline{N}^{0+}$ be the kernel, so that we have

$$(129)\qquad \underline{N}^{0+}_{\rho,\sigma} \simeq \underline{N}^{0+}.$$

Let us consider the homomorphism

$$(130)\quad \begin{cases} \mathbb{Z} \longrightarrow N^{0+} \\ n \longmapsto (n\lambda_0, n\lambda_0) \end{cases}$$

the image [d10] is interpreted as made up|made up of the systems (a_0,a_1,b_0,b_1) such that [d11]

$$a_1=b_1=0, \qquad a_0=b_0, \qquad ''$$

[d12] i.e. we have an exact sequence[i6]

$$0 \longrightarrow \mathbb{Z} \longrightarrow N^{0+} \longrightarrow \mathbb{Z}^3$$

$$(a_0,a_1,b_0,b_1) \longmapsto (a_1,b_1,a_0-b_0)$$

hence [d14] $N^{0+}/\mathbb{Z}$ is [d15] a free $\mathbb{Z}$-module of rank 1[i7],

thus an exact sequence of $\mathbb{Z}$-modules

$$(131)\quad 1 \longrightarrow \mathbb{Z} \longrightarrow N^{0+} \longrightarrow \Gamma^{0+} \longrightarrow 0$$

$$n \longmapsto (n\lambda_0, n\lambda_0) \qquad N^{0+}/\operatorname{Im}\mathbb{Z} \;\wr\; \text{dfn}$$

with Γ^{0+} a free $\mathbb{Z}$-module of rank 1.

We conclude from this

$$(132)\qquad \Gamma^{0+}_{\rho,\sigma} \simeq \underline{\Gamma}^{0+} \qquad (\simeq \mathbb{G}_a)$$

[d1] Thus, all the group schemes we have just constructed are smooth over $\operatorname{Spec}\mathbb{Z}$.

Can we define a more-or-less natural section of the extension ($N_{\rho,\sigma}$ of $\Gamma_{\rho,\sigma}$ by $L_0^{\underline{M}}$, hence of[i1] $M^{\sharp}_{\rho,\sigma}$ of $\underbrace{\Gamma_{\rho,\sigma}}_{\substack{\text{smooth of relative}\\ \text{dimension 2}}}$ by $\underline{M}$?

Taking into account the loop equation which describes $N_{\rho,\sigma}$, it seems that we find such a section as soon|some as we choose a splitting of

$$\begin{cases} 0 \to \overset{\text{rg 2}}{N^{0+}} \to M \times M \to \overset{\text{rg 2}}{M_0} \to 0 \qquad \text{and of} \\ \\ (133)\quad 0 \to \underset{\text{rg 1}}{\mathbb{Z}} \longrightarrow N^{0+} \longrightarrow \underset{\text{rg 1}}{\Gamma^{0+}} \to 0 \end{cases}$$

(category of $\mathbb{Z}$-modules). But we must check that the "set-theoretic" sections of schemes that this allows us to define are multiplicative…

[p. 684]

6°) $\underline{Z}_{\rho,\sigma}$ and $\underline{G}_{\rho,\sigma} = \mathbb{O}_{12}^* \cdot \underline{\mathcal{G}}^+$, $\underline{G}^\sharp_{\rho,\sigma} \simeq \mathbb{O}_{12}^* \cdot \underline{\mathcal{G}}^\sharp = \mathbb{O}_{12}^* \cdot \underline{M}$.

Once $\mathbb{O}_{12}^*$ and $M_0 \subset M$ have been introduced, it seems to me that the group $\underline{Z}_{\rho,\sigma}$ (in place of $\underline{\widetilde{Z}}_{\rho,\sigma}$, in which we took account of the α, β and not only of ξ, η) again becomes nice:

$$\underline{Z}_{\rho,\sigma} \subset \underline{\mathrm{Aut}}(\underline{\mathcal{G}}^+) \times \mathbb{O}_{12}^*$$
$$''$$

$$(134) \quad \left\{ (u, \underline{\mu}) \;\middle|\; \begin{array}{ll} \text{a)} & u(\rho) = \xi\rho \quad \text{(locally) } \underline{\mathcal{G}}^\sharp_\tau\text{-conjugate to } \rho, \text{ by an} \\ & \alpha \in \underline{\mathcal{G}}^\sharp_\tau \text{ such that } \chi(\alpha) = \varepsilon_3(\underline{\mu}) \\ \text{b)} & u(\sigma) = \eta\sigma \quad \text{(locally) } \underline{\mathcal{G}}^\sharp_\tau\text{+\textbar−conjugate to } \sigma, \text{ by a} \\ & \beta \in \underline{\mathcal{G}}^\sharp_\tau \text{ such that } \chi(\beta) = \varepsilon_2(\underline{\mu}) \\ \text{c)} & \text{loop equation} \\ & \xi_0 = \eta_0(\lambda_1^3)^{\nu''} \quad \text{i.e.} \quad \xi_0 = \eta_0 + 3\nu''\lambda_1 \\ & \qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad \text{in } \underline{M}_0 \end{array} \right.$$

where $\nu'' = \nu''(\underline{\mu}) \in \Gamma\mathbb{G}_a$ (cf. page verso page 686), and above[t])

$$(135) \quad \begin{cases} \xi_0 = \xi - \nu_3\lambda_1 \in \Gamma\underline{M}_0 & \nu_3 = \nu_3(\underline{\mu}) \\ \eta_0 = \eta\omega^{\nu_2} \in \Gamma\underline{M}_0 & \nu_2 = \nu_2(\underline{\mu}) \end{cases}$$

[d1] We shall have[i1] [d2] moreover that

$$(136) \quad \begin{cases} \xi_0 & \text{locally\textbar locally}^{mt} \text{ in the image of } (1 - \rho_{\underline{M}})(\underline{M}) \\ \eta_0 & \text{locally\textbar locally}^{mt} \text{ in the image } (1 - \sigma_{\underline{M}})(\underline{M}) \end{cases}$$

and we shall have

$$(137) \quad \underline{Z}_{\rho,\sigma} \simeq \underline{\Sigma}^{\mathrm{eff}}_{\rho,\sigma} \overset{\mathrm{dfn}}{=} \{(\underline{\mu}, \xi_0, \eta_0) \in \Gamma\mathbb{O}_{12}^* \times \underline{M}_0 \times M_0 \mid$$
$$1°) \quad \xi_0 = \eta_0 + \nu''(3\lambda_1) \quad \text{in } \underline{M}_0$$
$$\text{where } \nu'' = \nu''(\underline{\mu})$$
$$2°) \quad \text{we have (136)} \quad \}.$$

Now

$(1 - \rho_{\underline{M}})$:

$$\underline{M} \longrightarrow \underline{M}_0$$

$(1 - \sigma_{\underline{M}})$:

$$\underline{M} \longrightarrow \underline{\mathbb{Z}} = \mathbb{G}_a \longrightarrow \underline{M}_0$$

$$(b_0\lambda_0 + b_1\lambda_1) \longrightarrow (b_1 - b_0) \longmapsto \lambda \underbrace{(\lambda_1 - \lambda_0)}_{\delta} = \lambda\delta$$

[scan 76]

thus we have

$$\underline{L}^{\sharp}_{0} \simeq \underline{Z}^{+0}_{\rho,\sigma} \tag{145}$$

we shall have

$$\underline{\gamma}_{\rho,\sigma} \overset{\mathrm{dfn}}{=} \underline{Z}_{\rho,\sigma} / \underline{L}^{\sharp}_{0} \simeq \underline{\mathbb{O}}^{*}_{12} \ . \tag{146}$$

If we now construct $G_{\rho,\sigma}$
d1

as

$$\underline{G}_{\rho,\sigma} = (\underline{Z}_{\rho,\sigma} \cdot \underline{\mathcal{G}}^{+})/\underline{L}_{0}^{\sharp} \tag{147}$$

we find
(148)

$$\begin{array}{ccccccccc} 1 & \longrightarrow & \underline{L}_{0}^{\sharp} & \longrightarrow & \underline{Z}_{\rho,\sigma} & \longrightarrow & \overbrace{\gamma_{\rho,\sigma}}^{\mathbb{O}_{12}^{*}} & \longrightarrow & 1 \\ & & \downarrow & & \downarrow & & \wr & & \\ 1 & \longrightarrow & \underline{\mathcal{G}}^{+} & \longrightarrow & G_{\rho,\sigma} & \longrightarrow & \gamma_{\rho,\sigma} & \longrightarrow & 1 \end{array}$$

.
Moreover we have a canonical splitting of $\underline{Z}_{\rho,\sigma}$ over $\gamma_{\rho,\sigma} = \mathbb{O}_{12}^{*}$
(149)

$$\mathbb{O}_{12}^{*|\wedge} \longrightarrow \underline{Z}_{\rho,\sigma} \xrightarrow{\simeq} \underline{\Sigma}_{\rho,\sigma}^{\mathrm{eff}}$$

$$\underline{\mu} \longmapsto u_{\underline{\mu}}|\underline{\mu} \longrightarrow (\underline{\mu}, \xi_0 = \nu''(3\lambda_1), \eta_0 = 0)$$

m1487

Marginal note. m1487 N.B. We set $G_{\rho,\sigma}^{\sharp} = \underbrace{\mathbb{O}_{12}^{*}}_{\gamma_{\rho,\sigma}} \cdot \underbrace{\underline{\mathcal{G}}^{\sharp}}_{\underline{M}} \subset G_{\rho,\sigma}$.

whence

$$\begin{cases} \underline{Z}_{\rho,\sigma} \simeq \mathbb{O}_{12}^{*} \cdot \underline{L}_{0}^{\sharp} \\ G_{\rho,\sigma} \simeq \mathbb{O}_{12}^{*} \cdot \underline{\mathcal{G}}^{+} \end{cases} \tag{150}$$

The operation of $\mathbb{O}_{12}^{*}$ on $\underline{L}_{0}^{\sharp}$ is via

$$\mathbb{O}_{12}^{*} \longrightarrow \mathbb{G}_{m}$$

and homotheties, that of $\mathbb{O}_{12}^{*}$ on $\underline{\mathcal{G}}^{+}$ is given by

$$\begin{cases} u_{\underline{\mu}}(\rho) = [6\nu''|6\nu\lambda_1]\rho \quad (= \lambda_1^{6\nu''|6\nu}\rho \quad \text{in exponential notation}) \\ u_{\underline{\mu}}(\sigma) = \omega^{\nu_2}\sigma \\ u_{\underline{\mu}}(x) = \mu x \qquad \text{if } x \in \Gamma\underline{M}\,. \end{cases} \tag{151}$$

Scans 77–95

[scan 77]

[p. 686]

7°) The groups $\underline{N}_\rho$, [d1] etc, $\underline{N}_\rho^{\sharp|\sharp}$ etc. $\sigma\,\mathrm{D}\,\sigma$

Let us study the subgroup

$$\begin{array}{c} \underline{N}_\rho \subset \underline{G}_{\rho,\sigma} : \\ \| \\ \{\underline{u} \in \Gamma\underline{G}_{\rho,\sigma} \mid u(\rho) = \rho^{\varepsilon_3(\underline{u})}\}. \end{array} \tag{152}$$

m1489

Marginal note. [m1489] Provisional notation, cf. below page 697

[d2] The composite homomorphism

$$\underline{N}_\rho \hookrightarrow \underline{G}_{\rho,\sigma} \xrightarrow{\underline{\chi}} \mathbb{O}_{12}^*$$

is an epimorphism, [d4] let us check this to reassure ourselves.

Let $\underline{\mu}$ be a local section of $\mathbb{O}_{12}^*$, corresponding to $\nu_2, \nu_3, \nu_0, \mu, \nu', \nu'', \nu \ldots$ We will have

$$u_{\underline{\mu}}(\rho) = \lambda_1^{\nu}\rho = (\lambda_1^{3\nu''}\lambda_1^{-\nu_3})\rho = \mathrm{int}(\delta^{\nu''}\tau^{\nu_3})(\rho).$$

d9

d10

whence

$$\mathrm{int}\{(\delta^{\nu''}\tau_1^{\nu_3})^{-1} \cdot u_{\underline{\mu}}\}(\rho) = \rho \tag{153}$$

i.e.

$$\begin{cases} \underbrace{(\delta^{\nu''}\tau_1^{\nu_3})^{-1}u_{\underline{\mu}}}_{u} = \tau_1^{\nu_3}\delta^{-\nu''}u_{\underline{\mu}} \in \Gamma\underline{N}_\rho \\ \underline{\chi}(u) = \underline{\chi}((\delta^{\nu''}\tau_1^{\nu_3})^{-1}) \cdot \underbrace{\underline{\chi}(u_{\underline{\mu}})}_{\underline{\mu}} \\ \underline{\chi}(\tau_1^{\nu_3}) = \underbrace{(-1)^{\nu_3}}_{\varepsilon_3} \end{cases} \tag{154}$$

m1490

Marginal note. [m1490] N.B. We denote by $\underline{\chi}$ the canonical homomorphism

$$\underline{G}_{\rho,\sigma} \longrightarrow \mathbb{O}_{12}^*$$

Thus setting

$$v = (\omega\tau')^{\nu_3} u = \big(\underbrace{\omega\tau'\tau}_{\sigma}\big)^{\nu_3} \delta^{-\nu''} u_{\underline{\mu}}$$

d16 we will have i2

$$\underline{\chi}(v) = \underline{\mu}, \quad \text{with } v = \sigma^{\nu_3}\delta^{-\nu''} u_{\underline{\mu}} \in \Gamma \underline{N}_{\rho} \tag{154}$$

$$\left(\delta = \lambda_1\lambda_0^{-1}, \quad \begin{matrix} \nu_3 = \nu_3(\underline{\mu}), \\ \nu'' = \nu''(\underline{\mu}) \end{matrix}\right).$$

Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

[scan 78]

We will thus have an exact sequence

(155)

$$1 \longrightarrow \underline{Z|N}_{\rho} \longrightarrow \underline{N}_{\rho} \longrightarrow \mathbb{O}_{12}^{*} \longrightarrow 1, \qquad \mathbb{O}_{12}^{*} = \gamma_{\rho,\sigma}$$

and

$$\underline{Z|N}_{\rho} = \underline{\mathrm{Centr}}_{\underline{\mathcal{G}|\widetilde{G}^{+}}}(\rho).$$

We have, if

(156)
$$\begin{cases} H^{+}_{S_0} \overset{\text{dfn}}{=} \underline{\mathcal{G}|\widetilde{G}^{+}} \Big/ \underbrace{\underline{\mathcal{G}|\widetilde{G}^{0}}}_{\substack{\text{neutral}\\ \text{component,}\\ \simeq \underline{M}}} \simeq (H^{+})_{S_0} \\ \text{i.e.} \quad H^{+} = \mathcal{G}|\widetilde{G}^{+}/M, \end{cases}$$

a canonical homomorphism

(157)

$$\underline{Z}_{\rho} \longrightarrow \underline{\mathrm{Cent}}_{H^{+}_{S_0}}(\rho) \simeq \underline{L}_{\rho} \quad (\simeq (\mathbb{Z}/6\mathbb{Z})_{S_0})$$

d5 which is an epimorphism (since there is even a section, coming from the inclusion $\underline{L}_{\rho} \subset \underline{Z}_{\rho}$) and whose kernel is

(158) $$\underline{Z}^{0}_{\rho} = \underline{Z}_{\rho} \cap \underline{M} = \{x \in \Gamma\underline{M} \mid \rho_{\underline{M}}\underline{x} = x \quad \text{i.e.} \quad (1 - \rho_{\underline{M}}|1 + \rho_{\underline{M}})x = 0\}.$$

This kernel is zero over $\underbrace{\mathrm{Spec}\,\mathbb{Z}}_{S_0} \setminus \{3\}$, but of dimension 1 in dimension 3. Yet we do feel that the "good" definition of $\underline{Z}^{0}_{\rho}$ d7 must d8correspond toi2 an equation

(159) $$\ell|\varepsilon(1 - \rho_{\underline{M}})x = 0 \qquad \underline{\text{in } \underline{M}_0},$$

[scan 79]

[p. 687]

which in fact amounts simply,[i1] to replacing $\underline{N}_\rho$ defined in (152), by the schematic closure of its restriction over $S_0 - \{3\}$; We thus find a better subgroup, which from now on I denote by $\underline{N}_\rho$, fitting into the exact sequence

(159)

$$1 \longrightarrow \underline{L}_\rho \hookrightarrow \underline{N}_\rho \xrightarrow{\underline{\chi}_\rho} \underline{\mathbb{O}}^*_{12} \longrightarrow 1$$

Let us set

(160)
$$\begin{cases} \underline{G}^{\natural|\sharp}_{\rho,\sigma} = \underbrace{\underline{\mathbb{O}}^*_{12}}_{\gamma_{\rho,\sigma}} \cdot \underbrace{\underline{\mathcal{G}|\widetilde{G}}^{\natural|\sharp}}_{\underline{M}} \subset \underline{\mathbb{O}}^*_{12} \cdot \underline{\mathcal{G}|\widetilde{G}}^{+} = \underline{G}_{\rho,\sigma}, \\ \underline{N}^{\natural|\sharp}_\rho = \underline{N}_\rho \cap \underline{G}^{\natural|\sharp}_{\rho,\sigma} \end{cases}$$

we then find

(161)
$$\underline{N}^{\natural|\sharp}_\rho \cap \underline{L}_\rho = \underline{M} \cap \underline{L}_\rho = \{1\}$$

thus

(161)

$$\underline{N}_{\rho}^{\natural|\sharp} \hookrightarrow \underbrace{\underline{\mathbb{O}}_{12}^{*}}_{\gamma_{\rho,\sigma}}$$

I say that the image is

$$(162) \qquad \underline{\gamma}'_{\rho,\sigma} = \underline{\mathbb{O}}_{12}'^{*} \overset{\text{dfn}}{=} \left\{ \underline{\mu} \in \Gamma \underline{\mathbb{O}}_{12}^{*} \;\middle|\; \begin{array}{c} \varepsilon_3(\underline{\mu}) = 1 \\ \text{i.e. } \nu_3(\underline{\mu}) = 0 \end{array} \right\}.$$

m1493

Marginal note. m1493 thus we have $\underline{N}_{\rho}^{\natural|\sharp} \subset \underline{Z}_{\rho}$, it is better to denote it by $\underline{Z}_{\rho}^{\natural|\sharp}$.

That the image contains $\underline{\mathbb{O}}_{12}'^{*}$ follows from (154), let us show that it is contained.
Let

$$u = f^{-1} u_{\underline{\mu}}, \qquad f \in \Gamma \underline{\mathcal{G}|\widetilde{G}}^{\natural|\sharp} = \Gamma \underline{M}, \quad \underline{\mu} \in \Gamma \underline{\mathbb{O}}_{12}^{*}$$

be a local[i3] section of $\underline{G}_{\rho,\sigma}^{\natural|\sharp} = \mathbb{O}_{12}^{*} \underline{\mathcal{G}|\widetilde{G}}^{\natural|\sharp}$, let us write that it is in $\underline{N}_{\rho}$, whence 78

Apparatus for this scan

140-4-s079-I001 *insertion. Manuscript:* simply,
Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

140-4-s079-I002 *insertion. Manuscript:* $= \Gamma \underline{M}$
Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

140-4-s079-I003 *insertion. Manuscript:* local
Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

[scan 80]

$$\underbrace{\operatorname{int}(f^{-1})\, u_{\underline{\mu}}(\rho)}_{\lambda_1^{\nu}\rho} = \rho^{\varepsilon_3} \qquad \text{i.e.} \qquad \lambda_1^{\nu}\rho = \operatorname{int}(f)\rho^{\varepsilon_3}$$

reducing modulo $\underline{M}$ we find

$$\rho = \rho^{\varepsilon_3} \qquad \text{in } H^{+}$$

which implies $\varepsilon_3 = 1$, OK. Thus we have

(163)

$$\underbrace{\underline{N}_{\rho,}^{\natural|\sharp}}_{=\underline{Z}_{\rho}^{\natural|\sharp}} \xrightarrow{\sim} \underline{\gamma}'_{\rho,\sigma} = \underline{\mathbb{O}}_{12}'^{*}$$

— thus $\underline{Z}_{\rho}^{\natural|\sharp} = \underline{N}_{\rho,}^{\natural|\sharp}$ is a partial section, over $\underline{\mathbb{O}}_{12}'^{*|*'}$, of the extension $N_{\rho,\sigma}$ of $\underline{\mathbb{O}}_{12}^{*}$ by L_{ρ}.
d5 This partial section does

not contain τ', which is a section of $\underline{N}_\rho$. Does τ' normalize $\underline{Z|N^{\natural|\sharp}}_\rho$ — since it normalizes $\underline{N}_\rho$, it would suffice for it to normalize $\underline{G}^{\natural|\sharp}_{\rho,\sigma}$, [d9]

Since $\tau' = \tau\sigma$, [d10] and $\tau \in \Gamma\underline{G|\mathcal{G}^{\natural|\sharp}}_{\rho,\sigma}$ normalizes $\underline{G|\mathcal{G}^{\natural|\sharp}}_{\rho,\sigma}$, it amounts to the same thing to say that σ normalizes $\underline{G|\mathcal{G}^{\natural|\sharp}}_{\rho,\sigma} = \underline{\mathbb{O}}^*_{12} \cdot \underline{\mathcal{G}|\widetilde{G}^{\natural|\sharp}}$. Since σ normalizes $\underline{\mathcal{G}|\widetilde{G}^{\natural|\sharp}} = \underline{\mathcal{G}|\widetilde{G}}^0$ which is normal, it suffices to look at the action of σ on $\underline{\mathbb{O}}^*_{12} \subset G_{\rho,\sigma}$, [d12] i.e. on the $u_{\underline{\mu}}$ of (151). The question is whether the

$$\sigma u_{\underline{\mu}} \sigma^{-1} u_{\underline{\mu}}^{-1} \in \Gamma\underline{\mathcal{G}|\widetilde{G}^{\natural|\sharp}},$$

now

[p. 688]

$$\sigma u_{\underline{\mu}} \sigma^{-1} u_{\underline{\mu}}^{-1} = \sigma u_{\underline{\mu}}(\sigma)^{-1} = \sigma(\omega^{\nu_2}\sigma)^{-1} = \omega^{\nu_2}$$

thus

Proposition. For a section x [i1] of $\underline{G}^{\natural|\sharp}_{\rho,\sigma}$, [d1] $\sigma(x)$ is a section of $\underline{G}^{\natural|\sharp}_{\rho,\sigma} \cdot \underbrace{\{1,\omega\}_{S_0}}_{\mu_{S_0}}$ and its image in $\Gamma\{1,\omega\}$ is equal to $\nu_2(x)$ — so it is in $\underline{G}^{\natural|\sharp}_{\rho,\sigma}$ iff $\underline{\mu}(x)$ is a section of

$$\underline{\mathbb{O}}^{*\prime\prime}_{12} \overset{\text{def|dfn}}{=} \{\underline{\mu} \in \Gamma\underline{\mathbb{O}}^{*}_{12} \mid \varepsilon_2(\underline{\mu}) = 1\} \tag{164}$$

Corollary 1. $\underline{G}^{\natural|\sharp}_{\rho,\sigma}$ is not normalized by σ or τ', but

$$\underline{G}^{\prime\prime\natural|\sharp}_{\rho,\sigma} \overset{\text{dfn}}{=} \{x \in \Gamma\underline{G}^{\natural|\sharp}_{\rho,\sigma} \mid \varepsilon_2(x) = 1\} \tag{165}$$

is equal to

$$\underline{G}^{\natural|\sharp}_{\rho,\sigma} \cap \sigma(\underline{G}^{\natural|\sharp}_{\rho,\sigma}) = \underline{G}^{\natural|\sharp}_{\rho,\sigma} \cap \tau'(\underline{G}^{\natural|\sharp}_{\rho,\sigma})$$

and is normalized by σ and τ'.

Corollary 2. $\underline{Z|N}^{\natural|\sharp}_{\rho}$ is not normalized by σ or τ', but

$$\underline{Z|N}^{0\natural|\sharp}_{\rho} \overset{\text{dfn}}{=} \underline{Z|N}^{\natural|\sharp}_{\rho} \cap \underline{G}^{\prime\prime\natural|\sharp}_{\rho,\sigma} \subset \underline{Z|N}^{\natural|\sharp}_{\rho} \tag{166}$$

m1496

Marginal note. [m1496] N.B. We have $N^{\prime\prime\natural|\sharp}_{\rho} = (N^{\natural|\sharp}_{\rho})^0$ (identity component) is normalized by σ and τ' — [d5]

(167)

$$\begin{array}{ccc} \underline{Z|N}^{0\natural|\sharp}_{\rho} & \xrightarrow[\sim]{\chi_\rho} & \underline{\mathbb{O}}^{*0}_{12} \quad (= \underline{\mathbb{O}}^{*\prime}_{12} \cap \underline{\mathbb{O}}^{*\prime\prime}_{12}) \\ \| & & \\ (\underline{Z|N}^{\natural|\sharp}_{\rho})^0 & & \end{array}$$

m1497

Marginal note. [m1497] Do we have $\underline{Z}^{\prime\prime\natural|\sharp}_{\rho} = (\underline{N}_{\rho})^0$ (identity component) ? We should also [d6] $\underline{G}^{0}_{\rho,\sigma}$, $\underline{G}_{\rho,\sigma}/\underline{G}^{0}_{\rho,\sigma}$... compare with the diagrams (38) page 622'.

Corollary 3. Let

$$\underline{N}^{\prime\prime\prime}_{\rho(-\bar{j})} = \underbrace{\{1,\tau'\}_{S_0}}_{(\mu_{\tau'})_{S_0}} \underbrace{\underline{Z|N}^{0\natural|\sharp}_{\rho}}_{(\underline{Z|N}^{\natural|\sharp}_{\rho})^0} \subset \underline{N}_{\rho}, \tag{168}$$

then we have

(169)

$$\underline{N}^{\prime\prime\prime}_{\rho(-\bar{j})} \xrightarrow[\sim]{\chi_\rho} \underline{\mathbb{O}}^{*\prime\prime\prime}_{12} = \{\underline{\mu} \in \Gamma\underline{\mathbb{O}}^{*}_{12} \mid (\varepsilon_2\varepsilon_3)(\underline{\mu}) = 1\}$$

[scan 82]

Thus $N_{\rho}^{'''\natural\mid\sharp}$ is a partial section of N_{ρ} over $\mathbb{O}_{12}^{*'''}$. Finally, let us put

$$\underline{Z}^{!}_{\rho} = \underline{Z}^{0\natural\mid\sharp}_{\rho} \times \mu_{S_0} \qquad (\mu = \{1, \omega\}) \tag{170}$$

then $\underline{Z}^{!}_{\rho}$ is normalized by τ', and we can introduce

$$\underline{N}^{?}_{\rho} \overset{\text{dfn}}{=} (\mu_{\tau'} | \mu\tau')_{S_0} \cdot \underline{Z}^{!}_{\rho} \subset \underline{N}_{\rho} \tag{171}$$

so that $\underline{Z}^{0\natural\mid\sharp}_{\rho}$ has index 4 in $\underline{N}^{?}_{\rho}$. We then have

Corollary 4. We have an exact sequence

$$(172)\quad 1 \longrightarrow \underset{\substack{\| \text{dfn} \\ \mu_\rho}}{\mu_{S_0}} \longrightarrow \underline{N}^{?}_{\rho} \longrightarrow \underbrace{\underline{\mathbb{O}}^{*}_{12}}_{\gamma_{\rho,\sigma}} \longrightarrow 1$$

m1499

Marginal note. m1499 N.B. There is no need to redesignate|distinguish $\mathbb{O}^{*}_{12}$ — there is no, $N_\rho|N^{!}_\rho$ etc, no point of risk of confusion of the groups [illeg. 1]

$\underline{N}^{?}_{\rho}$ is a bi-section of the extension $\underline{N}_\rho$ of $\underline{\mathbb{O}}^{*}_{12}$ by L_ρ.

It would be worthwhile to develop the diagram of notable subgroups of $\underline{N}_\rho$, modeled on the diagram (38) of pages 622[1|′]. 81

[scan 83]

[p. 689]

8°) The groups $N_\sigma, N^{\natural|\sharp}_\sigma$ ....

Let us put

$$(173)\quad \begin{cases} \underline{N}_\sigma \subset \underline{G}_{\rho,\sigma} \\ \overset{\text{dfn}}{=} \left\{ \underline{u} \in \Gamma \underline{G}_{\rho,\sigma} \;\middle|\; \underline{u}(\sigma) = \sigma^{\varepsilon_2(\underline{u})} \left(= \omega^{\nu_2(\underline{u})}\sigma\right) \right\}. \end{cases}$$

$$(174)\quad \underline{N}^{\natural|\sharp}_\sigma \overset{\text{dfn}}{=} \underline{N}_\sigma \cap \underline{G}^{\natural|\sharp}_{\rho,\sigma}$$

The composite homomorphism

$$\underline{N}^{\natural|\sharp}_\sigma \hookrightarrow \underline{G}^{\natural|*}_{\rho,\sigma} \xrightarrow{\underline{\chi}} \mathbb{O}^{*}_{12}, \qquad \underline{N}^{\natural|\sharp}_\sigma \xrightarrow{\underline{\chi}_\sigma} \mathbb{O}^{*}_{12}$$

is an epimorphism. Indeed, the $u_{\underline{\mu}}$ are in d4 $N^{\natural|\sharp}_{\sigma|\rho}$ — so we even have a splitting

$$\mathbb{O}^{*}_{12} \hookrightarrow \underline{N}^{\natural|\sharp}_\sigma$$

, hence decompositions into $\frac{1}{2}$ direct products

$$(175)\quad \begin{cases} \underline{N}^{\natural|\sharp}_\sigma \simeq \mathbb{O}^{*}_{12} \cdot S\underline{Z}^{\natural|\sharp}_\sigma \\ \underline{N}_\sigma \simeq \mathbb{O}^{*}_{12} \cdot S\underline{Z}_\sigma \end{cases}$$

where we have put

$$(176)\qquad \begin{cases} \underline{Z}_\sigma = \mathrm{Ker}\left(\underline{N}_\sigma \xrightarrow{\varepsilon_2\circ\underline{\chi}_\sigma} \mu_{S_0}\right) = \underline{\mathrm{Cent}}_{\underline{G}_{\rho,\sigma}}(\sigma) \\ S\underline{Z}_\sigma = \underline{Z}_\sigma \cap \underline{\mathcal{G}|\widetilde{G}}^{+} = \underline{\mathrm{Cent}}_{\underline{\mathcal{G}|\widetilde{G}}^{+}}(\sigma) \\ \underline{Z}_\sigma^{\natural|\sharp} = \underline{Z}_\sigma \cap \underline{G}_{\rho,\sigma}^{\natural|\sharp} \\ S\underline{Z}_\sigma^{\natural|\sharp} = S\underline{Z}_\sigma \cap \underbrace{\underline{\mathcal{G}|\widetilde{G}}^{\natural|\sharp}}_{=\underline{\mathcal{G}|\widetilde{G}}^{0}=\underline{M}} \end{cases}$$

Moreover we have

$$\begin{array}{ccc} S\underline{Z}_\sigma & \longrightarrow & \underline{\mathrm{Cent}}_{H^+_{S_0}}(\sigma) \\ & \overset{\hookleftarrow|\leftrightarrow}{\nwarrow} & \uparrow{\scriptstyle 2|\wr}\ \uparrow{\scriptstyle \delta|\wr} \\ & & \underline{L}_\sigma \simeq (\mathbb{Z}/4\mathbb{Z})_{S_0} \end{array}$$

which has a section, hence

$$(177)\qquad S\underline{Z}_\sigma \simeq L_\sigma \times S\underline{Z}_\sigma^{\natural|\sharp}$$

[scan 84]

Finally

$$(178)\qquad \begin{array}{c} S\underline{Z}_{\sigma}^{\natural|\sharp} \subset \underline{M} \\ \| \\ \left\{ x \in \Gamma \underline{M} \;\middle|\; (1-\sigma_{\underline{M}})(x) = 0 \right\} = \{ a_0\lambda_0 + a_1\lambda_1 \mid a_0 = a_1 \} \\ = \{ a(\lambda_0+\lambda_1) \mid a \in \Gamma \mathbb{G}_a \} \simeq \mathbb{G}_a, \end{array}$$

hence, taking 177 into account :

$$(179)\qquad \begin{cases} S\underline{Z}_{\sigma} \simeq \underline{L}_{\sigma} \times \underbrace{\mathbb{G}_a}_{S\underline{Z}_{\sigma}^{\natural|\sharp}} \\ S\underline{Z}_{\sigma}^{\natural|\sharp} = (S\underline{Z}_{\sigma})^0 \quad \text{(identity component)} \simeq \mathbb{G}_a \end{cases}$$

We thus have

$$1 \longrightarrow \underset{\wr| \; S\underline{Z}_{\sigma}^{\natural|\sharp}}{\mathbb{G}_a} \longrightarrow \underline{N}_{\sigma}^{\natural|\sharp} \longrightarrow \underset{\| \; \gamma_{\rho,\sigma}}{\mathbb{O}_{12}^*} \longrightarrow 1$$

, more precisely the isomorphisms (175)(177)(179) give

$$(180)\qquad \begin{array}{l} \underline{N}_{\sigma}^{\natural|\sharp} \simeq \mathbb{O}_{12}^* \cdot \mathbb{G}_a \\ \underline{N}_{\sigma} \simeq \mathbb{O}_{12}^* \cdot (\underline{L}_{\sigma} \times \mathbb{G}_a) \end{array}$$

In these formulas, $\mathbb{O}_{12}^*$ operates on $\mathbb{G}_a$ via

$$\chi : \mathbb{O}_{12}^* \longrightarrow \mathbb{G}_m$$

, and on L_σ via

$$\varepsilon_2 : \mathbb{O}_{12}^* \longrightarrow (\pm 1)_{S_0}$$

:

$$(181)\qquad \begin{cases} \underline{\mu}(\lambda) = \mu \cdot \lambda \\ \underline{\mu}(\sigma) = \sigma^{\varepsilon_2} \end{cases} \qquad \text{where } \mu = \chi(\underline{\mu}),\ \varepsilon_2 = \varepsilon_2(\underline{\mu})$$

[scan 85]

[p. 690]

9°) Return to $\underline{M}_{\rho,\sigma}$.

Drawing inspiration from the developments of § 49 (in particular VI, 5°)), we shall set

$$(182)\qquad \begin{cases} S_0|s_0\underline{M}_{\rho,\sigma} = \underline{Z}_{\rho,\sigma} \times_\gamma \underline{N}^?_\rho \times_\gamma \underline{N}^{\natural|\sharp}_\sigma \times_\gamma \underline{G}_{\rho,\sigma} \\ S_0|s_0\underline{M}^{\natural|\sharp}_{\rho,\sigma} = \underline{Z}_{\rho,\sigma} \times_\gamma \underline{N}^?_\rho \times_\gamma \underline{N}^{\natural|\sharp}_\sigma \times_\gamma \underline{G}^{\natural|\sharp}_{\rho,\sigma} \end{cases}$$

$$(183)\qquad \begin{cases} \underline{M}_{\rho,\sigma} = \underline{N}^?_\rho \times_\gamma \underline{N}^{\natural|\sharp}_\sigma \times_\gamma \underline{G}_{\rho,\sigma} \\ \underline{M}^{\natural|\sharp}_{\rho,\sigma} = \underline{N}^?_\rho \times_\gamma \underline{N}^{\natural|\sharp}_\sigma \times_\gamma \underline{G}^{\natural|\sharp}_{\rho,\sigma} \end{cases}$$

$$(184)\qquad \begin{cases} S_0|s_0\Gamma_{\rho,\sigma} = \underline{Z}_{\rho,\sigma} \times_\gamma \underline{N}^?_{\rho|1} \times_\gamma \underline{N}^{\natural|\sharp}_\sigma \\ \Gamma_{\rho,\sigma} = \underline{N}^?_\rho \times_\gamma \underline{N}^{\natural|\sharp}_\sigma \end{cases}$$

where [d2]

$$\gamma = \gamma_{\rho,\sigma} = \mathbb{O}^*_{12}.$$

In fact, the groups $S_0|s_0\underline{M}_{\rho,\sigma}, S_0|s_0\underline{M}^{\natural|\sharp}_{\rho,\sigma}$, $S_0|s_0\Gamma_{\rho,\sigma}$ play rather an auxiliary technical role, they are extensions of the groups $\underline{M}_{\rho,\sigma}$, $\underline{M}^{\natural|\sharp}_{\rho,\sigma}$ or $\underline{\Gamma}_{\rho,\sigma}$ by

$$L_0^{\underline{M}} = \mathrm{Ker}\left(\underline{Z}_{\rho,\sigma} \longrightarrow \underset{\gamma}{\mathbb{O}^*_{12}}\right),$$

the first two[i1] deduced from the extension $S_0|s_0\underline{\Gamma}_{\rho,\sigma}$ of $\underline{\Gamma}_{\rho,\sigma}$ by $L_0^{\underline{M}} \simeq \mathbb{G}_a$, by inverse image via the epimorphisms $\underline{M}_{\rho,\sigma} \longrightarrow \underline{\Gamma}_{\rho,\sigma}$ and the induced epimorphism $\underline{M}^{\natural|\sharp}_{\rho,\sigma} \longrightarrow \underline{\Gamma}_{\rho,\sigma}$.

We shall turn our attention chiefly to the other groups (without $S_0|s_0$), linked by a diagram of exact sequences (compare page 639 (79)): 84

[p. 691]

We then find canonical isomorphisms

$$(195)\qquad \begin{cases} \underline{M}_{\rho,\sigma}/\mu_\rho \;\simeq\; \mathbb{O}_{12}^* \cdot (\mathbb{G}_a \times \underline{\mathcal{G}|\widetilde{G}}^+) \\ \uparrow \qquad\qquad \| \qquad\qquad \uparrow \\ \underline{M}^{\natural|\sharp}_{\rho,\sigma}/\mu_\rho \;\simeq\; \mathbb{O}_{12}^* \cdot (\underbrace{\mathbb{G}_a \times \underline{M}}_{\mathbb{G}_a \times \underline{\mathcal{G}|\widetilde{G}}^+}) \\ \\ \underline{\Gamma}_{\rho,\sigma} \;\simeq\; \mathbb{O}_{12}^* \cdot \mathbb{G}_a \end{cases}$$

m1505

Marginal note. m1505 operations of $\mathbb{O}_{12}^*$ on $\mathbb{G}_a \times \underline{\mathcal{G}|\widetilde{G}}^+$ given by (181) and (151). On $\mathbb{G}_a \times \underline{M}$ d1, $\mathbb{O}_{12}^*$ operates simply by homothety.

$\underline{M}_{\rho,\sigma}$ and $\underline{M}^{\natural|\sharp}_{\rho,\sigma}$, as extensions, of $\underline{M}_{\rho,\sigma}/\mu_\rho$ and $\underline{M}^{\natural|\sharp}_{\rho,\sigma}/\mu_\rho$ by μ_ρ, are deduced from the extension

$$(196)\qquad 1 \to \mu_\rho \to N_\rho^? \to \mathbb{O}_{12}^* \to 1$$

of $\mathbb{O}_{12}^*$ by μ_ρ, by inverse images under the canonical homomorphisms from the groups (195) onto the factor $\mathbb{O}_{12}^*$. We should come back to the extension (196), which is surely the inverse image of an extension of $(\mu \times \mu)_{S_0}$ by μ, via

$$\underline{\mathbb{O}}_{12}^* \xrightarrow{(\varepsilon_2,\varepsilon_3)} (\mu \times \mu)_{S_0}$$

(Compare § 49 V 8°). d2

The operation of $\mathbb{O}_{12}^*$ on $\mathbb{G}_a \times \underline{\mathcal{G}|\widetilde{G}}^+$ (the one on $\mathbb{G}_a \times \underline{\mathcal{G}|\widetilde{G}}^{\natural|\sharp} = \mathbb{G}_a \times \underline{M}$) takes place via operations on $\mathbb{G}_a$ and $\underline{\mathcal{G}|\widetilde{G}}^+$, which are made explicit d3 by (181) and (151). 86

[scan 90]

Finally we put

$$(205)\quad \begin{array}{c} \underline{M}^{\dagger|'}_{\rho,\sigma}(-\bar{\jmath}) \subset \underline{M}_{\rho,\sigma} \\ \| \\ \{(a,b,U) \in \Gamma\underline{M}_{\rho,\sigma} \mid U = a\} \end{array}$$

here we will not necessarily have $U \in \Gamma(\underline{G}^{\natural|\sharp}_{\rho,\sigma})$ since [d3] $\underline{N}^?_\rho \not\subset \underline{G}^{\natural|\sharp}_{\rho,\sigma}$, thus

$$\underline{M}^{\dagger|'}_{\rho,\sigma}(-\bar{\jmath}) \not\subset \underline{M}^{\natural|\sharp}_{\rho,\sigma},$$

contrary to what happens for $\underline{M}_{\rho,\sigma}(0)$, $\underline{M}_{\rho,\sigma}[0]$, $\underline{M}_{\rho,\sigma}(\frac{1}{2})$. We will have a

$$(206)\quad \begin{cases} \underline{M}^{\dagger|'}_{\rho,\sigma}(-\bar{\jmath}) \xrightarrow{\sim} \underline{\Gamma}_{\rho,\sigma} \\ \underline{M}_{\rho,\sigma} \simeq \underline{M}_{\rho,\sigma}(-\bar{\jmath}) \cdot \underline{\mathcal{G}|\widetilde{G}^+} \end{cases}$$

But we [d6]have[i1]

$$\underline{\mu}_{\rho} \not\subset \underline{M}_{\rho,\sigma}(-\bar{\jmath})$$

more precisely

$$\underline{\mu}_{\rho} \cap \underline{M}_{\rho,\sigma}(-\bar{\jmath}) = \{1\}$$

thus [d7] $\underline{M}_{\rho,\sigma}(-\bar{\jmath})$ does not define (like $\underline{M}_{\rho,\sigma}(\frac{1}{2})$) a section of $\underline{M}_{\rho,\sigma}/\underline{\mu}_{\rho}$ [d8]on[i2] top of $\underline{\Gamma}_{\rho,\sigma}/\underline{\mu}_{\rho}$ ($\simeq \underline{N}_{\sigma}^{\natural\sharp} \simeq \mathbb{O}_{12}^{*} \cdot \mathbb{G}_{a}$). We nevertheless have

$$\underline{M}_{\rho,\sigma}(-\bar{\jmath}) \cdot \underline{\mu}_{\rho} = \underline{M}_{\rho,\sigma}(-\bar{\jmath}) \cdot \underline{\mu}_{G}$$

and putting

$$\begin{aligned} \underline{M}^{\sim}_{\rho,\sigma}(-\bar{\jmath}) &\overset{\text{déf}}{=} \underline{M}_{\rho,\sigma}(-\bar{\jmath}) \cdot \underline{\mu}_{\rho}/\underline{\mu}_{\rho} \\ &= \underset{\text{(isomorphic}}{\operatorname{Im}} \left(\ \underline{M}_{\rho,\sigma}(-\bar{\jmath}) \to \underline{M}_{\rho,\sigma}/\mu_{\rho} \ \right), \end{aligned} \tag{207}$$

$\underline{\Gamma}^{\sim}_{\rho,\sigma} = \underline{\Gamma}_{\rho,\sigma}/\underline{\mu}_{\rho} = (\underline{M}_{\rho,\sigma}/\underline{\mu}_{\rho})/\underline{\mathcal{G}|\widetilde{G}}^{+}$[i4]

[scan 92]

later on, between the respective possible notations for the groups denoted here $\underline{M}_{\rho,\sigma}$ and $\underline{M}_{\rho,\sigma}/\underline{\mu}_\rho \simeq \underline{M}^{\sim}_{\rho,\sigma}$ (and ditto with $\natural|\sharp$) — it is these latter, it is true, that seem to me the most interesting, for it is they* that link up with the universal group $M|\mathcal{M} = N|\mathcal{N}^{\sim}_{1,1}$ (extension of $\Gamma^{\sim}_{\mathbb{Q}}$ by $\mathcal{G}|G^{\wedge}_0 = (\mathrm{SL}(2,\mathbb{Z}))^{\wedge}$). m1518

Marginal note. m1518 rather, the group of their $\widehat{\mathbb{Z}}$-points respct...|respect...

It would seem that these groups would deserve the simplest notation, in this case $\underline{M}_{\rho,\sigma}$, and the groups denoted previously $\underline{M}_{\rho,\sigma}$ would take on their $\sim$, or an analogous sign. (The $\sim$ is

already used in a rather different sense in $\Gamma^{\sim}_{\mathbb{Q}}$, $M^{\sim}_{0,3}$ etc — on the other hand the superscripts $'$, $''$, $'''$, $^{\circ}$, $+$, $!$, $\natural|\sharp$ [d2] are already used in different senses. The double use of $\sim$ moreover risks leading to conflicts of notation sooner or later, it is perhaps preferable to replace the $\sim$ in $\Gamma^{\sim}_{\mathbb{Q}}$ by letters such as $\Gamma^{\text{ét}}_{\mathbb{Q}}$ (suggesting "extended") or [d3] "generalized" gen… [d4] I will have to resolve these di- 91

[p. 695] 11°) The homomorphism $M \longrightarrow \underline{M}_{\rho,\sigma}(\widehat{\mathbb{Z}})^\Delta$, relation with the tower of Fermat curves.

Let us note that we have for every integer $N \in \mathbb{N}^*$

$$(215) \qquad \mathbb{O}_N^\Delta(\widehat{\mathbb{Z}}) \simeq \widehat{\mathbb{Z}} \qquad \text{hence} \qquad \mathbb{O}_N^*(\widehat{\mathbb{Z}})^\Delta \simeq \widehat{\mathbb{Z}}^*.$$

m1524

Marginal note. [m1524] The Δ indicates that we take the sections which are constant modulo the identity component.

We therefore have, taking into account the decompositions into semidirect products (150) etc, isomorphisms

$$(216)\qquad \begin{cases} Z^{\ell|\wedge}_{\rho,\sigma} \overset{\text{dfn}}{=} \underline{Z}_{\rho,\sigma}(\widehat{\mathbb{Z}})^{\Delta} = \widehat{\mathbb{Z}}^* \cdot \widehat{L}_0 \quad \text{where} \quad \widehat{L}_0 \simeq \widehat{\mathbb{Z}} \cdot \lambda_0 \simeq \widehat{\mathbb{Z}} \\ G_{\rho,\sigma} \overset{\text{dfn}}{=} \underline{G}_{\rho,\sigma}(\widehat{\mathbb{Z}})^{\Delta} = \widehat{\mathbb{Z}}^* \cdot \underline{\mathcal{G}|\widetilde{G}^{+\wedge}} \\ G^{\natural|\sharp}_{\rho,\sigma} \overset{\text{dfn}}{=} \underline{G}^{\natural|\sharp}_{\rho,\sigma}(\widehat{\mathbb{Z}})^{\Delta} \simeq \widehat{\mathbb{Z}}^* \cdot \widehat{M} \\ N^{\sim}_{\rho} \overset{\text{df}}{=} \underline{N}^{\sim}_{\rho}(\widehat{\mathbb{Z}})^{\Delta} \simeq \mathbb{O}^*_{12}(\widehat{\mathbb{Z}})^{\Delta} \simeq \widehat{\mathbb{Z}}^* \\ N^{\natural|\sharp}_{\sigma} \overset{\text{df}}{=} \underline{N}^{\natural|\sharp}_{\sigma}(\widehat{\mathbb{Z}})^{\Delta} \simeq \widehat{\mathbb{Z}}^* \cdot \widehat{\mathbb{Z}} \\ M^{\sim}_{\rho,\sigma} \overset{\text{df}}{=} \underline{M}_{\rho,\sigma}(\widehat{\mathbb{Z}})^{\Delta} \simeq \widehat{\mathbb{Z}}^* \cdot (\widehat{\mathbb{Z}} \times \mathcal{G}|\widetilde{G}^{+\wedge}) \\ M^{\sim\natural|\sharp}_{\rho,\sigma} \overset{\text{df}}{=} \underline{M}^{\natural|\sharp}_{\rho,\sigma}(\widehat{\mathbb{Z}})^{\Delta} \simeq \widehat{\mathbb{Z}}^* \cdot (\widehat{\mathbb{Z}} \times \widehat{M}) \end{cases}$$

where the operations of $\widehat{\mathbb{Z}}^*$ on the $2^{\text{nd}}|2^{\text{nd}}$ $\frac{1}{2}$ direct factors are made explicit in the preceding sections. We will note that, despite the trappings|appearances of the notations and definitions, the profinite[i1] groups $Z_{\rho,\sigma}$ and preceding ones are also those which would be constructed [d9] directly, in terms of $(\mathcal{G}|\widetilde{G}^{+|\natural\wedge}, \mathcal{G}|\widetilde{G}^{\natural|\sharp\wedge} = M^{\wedge})$ (equipped* with ρ, σ, τ), in § 49 VI. We therefore have a canonical homomorphism

$$(217)\qquad \begin{cases} M = N|\mathcal{N}^{\text{ét}}_{1,1} \longrightarrow M^{\sim}_{\rho,\sigma} \\ \quad \cup \qquad\qquad\quad \cup \\ \quad M^{!} \longrightarrow M^{\sim\natural|\sharp}_{\rho,\sigma} \end{cases}$$

which as usual decomposes into 94

Scans 96–114

[scan 96]

three, compatible with one and the same homomorphism

$$\mathcal{M} \longrightarrow \gamma_{\rho,\sigma} \overset{\text{def}}{=} \underbrace{\gamma^*_{\rho,\sigma} \,|\, \gamma^\bullet_{\rho,\sigma}}_{\mathbb{O}^*_{12}} (\widehat{\mathbb{Z}})^\Delta = \widehat{\mathbb{Z}}^*$$

which is none other than the cyclotomic character χ. One[d4] of these three,

$$\begin{array}{ccccc} \mathcal{M} & \longrightarrow & N^\sim_\rho & \twoheadrightarrow & \widehat{\mathbb{Z}}^*, \\ & \searrow \quad \nearrow & & & \\ & \Gamma^{\text{et}}_{\mathbb{Q}} & & & \end{array}$$

reduces here to the said character, and thus raises no interesting question. We have on the other hand

(218)

$$\begin{array}{ccc} \mathcal{M} & \longrightarrow & G_{\rho,\sigma} = \widehat{\mathbb{Z}}^* \cdot \mathfrak{S}^{+\wedge} \\ \downarrow & & \downarrow \\ \mathcal{M}^! & \longrightarrow & G^{\natural|\sharp}_{\rho,\sigma} = \widehat{\mathbb{Z}}^* \cdot M^\wedge, \end{array}$$

which will have to be examined more closely — as the cyclotomic character is (even on $\mathcal{M}^!$)[i2] surjective, we know in any case that these two homomorphisms are surjective. Finally, we have a homomorphism $\mathcal{M} \longrightarrow N^{\natural|\sharp}_\sigma$, which factors as

(219)

$$\Gamma^{\text{et}}_{\mathbb{Q}} \longrightarrow N^{\natural|\sharp}_\sigma = \widehat{\mathbb{Z}}^* \cdot \widehat{\mathbb{Z}}$$

($\frac{1}{2}$ direct)

which will also have to be examined — in particular see whether it is surjective. Of course, I have a chance of doing so only by the "arithmetic route", by proving that the homomorphism induced on $\Gamma_{\mathbb{Q}}$ itself is an epimorphism. 95

[scan 97]

[p. 696]

I feel like putting these homomorphisms in relation with the "tower" of algebraic curves defined over $\mathbb{Q}$, indexed by $n \in \mathbb{N}^*|\mathbb{N}^\wedge$
(220)

$$\begin{array}{l} X_n : \\ \cap \\ \mathbb{P}^2_{\mathbb{Q}} \end{array} \qquad x_0^n + x_1^n + x_\infty^n = 0$$

(Fermat curve of index n)

Let U_n be the open set of points where $x_0 x_1 x_\infty \neq 0$[i1]

On X_n the group scheme $\mu_n^{\{0,1,\infty\}}/\underbrace{\mu_n}_{\text{diag.}}$ operates ($\mu_n = {}_n\mathbb{G}_m$), [d1] as does $\mathfrak{S}_3 = \mathfrak{S}_{\{0,1,\infty\}}$, hence also the semidirect product

$$\underline{F}_n = \mathfrak{S}_3 \cdot \underbrace{\mu_n^{\{0,1,\infty\}}/\mu_n}_{\underline{F}^\circ_n}, \tag{221}$$

m1527

Marginal note. [m1527] Notation F_n not very happy — it is possible that there will be need later for the letter F_n, F_∞ for the Fermat coverings U_n, U_∞ themselves... (compare corrections|rectifications page 719!)

we have

$$X_n/\underline{F}^\circ_n \simeq X_1 \simeq U_{0,3}, \tag{222}$$

the isomorphism compatible with the actions of $\mathfrak{S}_3$. More generally, we have, if $n = n'd$, a morphism
(223)

$$X_{n=n'd} \longrightarrow X_{n'}$$

$$x_i \longmapsto x_i^d$$

and in this way U_n becomes a principal covering (= torsor) over $U_{n'}$, with group $\mu_d^{\{0,1,\infty\}}/\mu_d$, More precisely still, d4
d5

$$\begin{array}{ccc} \| & \longrightarrow & \| \end{array}$$

d1 we have a canonical exact sequence

(224)

$$1 \longrightarrow \mu_d^{\{0,1,\infty\}} \longrightarrow \underset{\mathfrak{S}_{3\,S_0} \cdot \mu_n^{\{0,1,\infty\}}}{\underline{F}_n} \to \underset{\mathfrak{S}_{3\,S_0} \cdot \mu_{n'}^{\{0,1,\infty\}}}{\underline{F}_{n'}} \to 1$$

$$(x_0, x_1, x_\infty) \longmapsto (x_0, x_1, x_\infty)$$

$$(x_0, x_1, x_\infty) \longmapsto (x_0^d, x_1^d, x_\infty^d)$$

$$g \longmapsto g$$

$$\text{for } \begin{matrix} x_0, x_1, x_\infty \in \Gamma\mu_n, \\ g \in \Gamma\mathfrak{S}_{3\,S_0} \end{matrix} \quad)$$

and the morphism|the isomorphism (223) is compatible with (224), and induces an isomorphism (compatible with actions of $F_{n'}$)

$$(225) \qquad X_{n'} \simeq X_n/(\mu_d^{\{0,1,\infty\}}/\mu_d),$$

Moreover, the action of

$$\underline{F}_n^\circ = \mu_n^{\{0,1,\infty\}}/\mu_n$$

on U_n is free, and a fortiori that of $\mu_d^{\{0,1,\infty\}}/\mu_d$ is, so that U_n is indeed a torsor over $U_{n'}$ with group

$$\underline{F}_d^\circ = \mu_d^{\{0,1,\infty\}}/\mu_d$$

Passing to the limit, we find

$$(226) \qquad \begin{cases} X_\infty = \varprojlim_{n \in \mathbb{N}^*} X_n, \quad U_\infty = \varprojlim U_n \\ \underline{F}_\infty = \varprojlim \underline{F}_n = (\mathfrak{S}_3)_{S_0} \cdot \left(\widehat{\mathbb{Z}}^{\{0,1,\infty\}}/\widehat{\mathbb{Z}}\right) \otimes_{\widehat{\mathbb{Z}}} T_\bullet(\mathbb{G}_m)|T(\mathbb{G}_m) \end{cases}$$

giving of an $\widehat{M}$-conjugacy class of liftings of $\mathcal{M}_{0,3} \longrightarrow \mathfrak{S}_3 \times \widehat{\mathbb{Z}}^*$ to a

$$(238)\quad \mathcal{M}_{0,3} \longrightarrow \mathrm{Aff}\,.$$

m1535

Marginal note. [m1535] N.B. This homomorphism induces on $\Pi^\wedge_{0,3}$ the canonical homomorphism

$$\Pi^\wedge_{0,3} \to (\Pi^\wedge_{0,3})_{\mathrm{ab}} \xrightarrow{\sim} \widehat{M}$$

an essential property of this homomorphism.

The choice of such a lifting depends on the choice of a point of $U_\infty(\overline{\mathbb{Q}})$ above the point $-\bar{\jmath}$ of $U_{0,3}(\overline{\mathbb{Q}})$ — the chg^t of this origin point is made by translation by an $x \in \widehat{M}$, and the lifting (238) is then changed by inner automorphism by this element x.

Thus the Fermat tower provides such a conjugacy class of liftings(238)[i1], knowledge of which is in principle equivalent to that of the Fermat tower up to isomorphism. We would like to put, if possible, these liftings in correspondence with the|the homomorphisms (217), and more particularly one of them (218), which provides a canonical[i2] homomorphism from $\mathcal{M}_{0,3}$, not into [d1] Aff, but into [d2] the analogous group $G_{\rho,\sigma}/\mu_G$ of (232), which lifts the same homomorphism $\mathcal{M}_{0,3} \longrightarrow \widehat{\mathbb{Z}}^* \times \mathfrak{S}_3$. 101

[scan 104]

a [d1] homomorphism of sequences[i1] that are exact

$$\begin{array}{ccccccccc} 1 & \longrightarrow & M^{\wedge} & \longrightarrow & \mathcal{M}_1 & \longrightarrow & \mathcal{N}_{0,3} & \longrightarrow & 1 \\ & & \| & & \downarrow & & \downarrow & & \\ (242) \quad 1 & \longrightarrow & M^{\wedge} & \twoheadrightarrow & \mathrm{Aff} & \longrightarrow & \widehat{\mathbb{Z}}^* \times \mathfrak{S}_3 & \longrightarrow & 1, \end{array}$$

(depending on the choice of a $\mathfrak{p}^t$ of $U_{\infty}(\overline{\mathbb{Q}})$ above $-\bar{\jmath}$) which shows that the extension $\mathcal{M}_1$[i2] of $\Gamma_{\mathbb{Q}}$ by $\widehat{M}$ [d3]is therefore[i3] with|: the inverse image of the trivial extension Aff of $\widehat{\mathbb{Z}}^* \times \mathfrak{S}_3$ by $M^{\wedge}$, hence is trivial. More precisely still, let us consider the quotient $\mathcal{M}_2$[i4] of $\mathcal{M}_1$ by the kernel of $\mathcal{M}_1 \longrightarrow \mathrm{Aff}$, we find a diagram

$$\begin{array}{ccccccccc} 1 & \longrightarrow & M^{\wedge} & \to & \mathcal{M}_2 & \longrightarrow & N_2 & \longrightarrow & 1 \\ & & \downarrow & & \downarrow & & \downarrow & & \\ (242\text{ bis}) \quad 1 & \text{—} & M^{\wedge} & \to & \mathrm{Aff} & \text{—} & \widehat{\mathbb{Z}}^* \times \mathfrak{S}_3 & \text{—} & 1 \end{array}$$

(where $N_2 \overset{\text{def}}{\simeq} \mathcal{M}_2/\operatorname{Im} M^{\wedge}$). We thus see that the extension of N_2 by $M^{\wedge}$ is trivial — we have an $M^{\wedge}$-conjugacy class of splittings of this extension — the splittings corresponding to the p^{ts} of [d4] $U_{\infty}(\overline{\mathbb{Q}})$ above the p^t $-\bar{\jmath}$ of $U_{0,3}(\overline{\mathbb{Q}})$ 103

[p. 700]

We would really like to show that this homomorphism $\mathcal{M}_{0,3} \longrightarrow \mathrm{Aff}$ is isomorphic to the homomorphism $\mathcal{M}_{0,3} \longrightarrow G_{\rho,\sigma}/\mu_G$ of (239), by means of a suitable isomorphism of extensions between Aff and $G_{\rho,\sigma}/\mu_G$. This would imply that this latter extension is split. The isomorphisms of this extension onto Aff correspond exactly to the splittings of this extension.

12°) Splittings of the extension $\underline{G}_{\rho,\sigma}/\mu_G$ of $\mathbb{O}_{12}^* \times \mathfrak{S}_3$ by $\underline{M}$.

Since we already have a lifting

$$\mathbb{O}_{12}^* \hookrightarrow \underline{G}_{\rho,\sigma}$$

(150|180, 151), I am going to look at the splittings of the extension (231) which extend this one — or what amounts to the same thing, the splittings of the induced extension on $\mathfrak{S}_3$: m1539

Marginal note. m1539 not quite — one would have to|has to restrict oneself to the splittings

$$(\mathfrak{S}_3)_{S_0} \to \underline{\mathfrak{S}}^+/\mu_{\mathfrak{S}}$$

which commute with $\underline{G}_{\rho,\sigma}(0) \simeq \mathbb{O}_{12}^*$

$$(243)\quad 1 \longrightarrow \underline{M} \to \underline{\mathfrak{S}}^+/\mu_{\mathfrak{S}} \to \underbrace{(\mathfrak{S}_3)_{S_0}}_{(H/\mu)_{S_0}} \to 1$$

m1540

Marginal note. m1540 We look at the d1 splittings over an arbitrary base S.

The splittings correspond d2 bijectively to the pairs 104

$$\begin{cases} (\rho', \sigma') = (\zeta\rho, \eta\rho) & \text{with } \zeta, \eta \in \Gamma\underline{M} \\ \text{satisfying} & \\ \rho'^3 = \sigma'^2 = 1, \qquad \sigma'(\rho') = \rho'^{-1}. & \end{cases} \tag{244}$$

We are going to interpret these conditions in terms of ζ, η. The condition $\rho'^3 = 1$ is written (since $\dot{\rho}|\rho^3 = 1$ in $(\mathfrak{S}_3)_{S_0}$)

$$\zeta\rho(\zeta)\rho^2(\zeta) = 1 \qquad \text{i.e. additively} \qquad (1 + \rho_{\underline{M}} + \rho_{\underline{M}}^2)(\zeta) = 0 \tag{245}$$

this condition is always|always satisfied, for we have

$$1 + \rho_{\underline{M}} + \rho_{\underline{M}}^2 = 0, \tag{245}$$

The condition $\sigma'^2 = 1$ is written

$$\eta\sigma(\eta) = 1 \qquad \text{i.e. additively} \qquad (1 + \sigma_{M|\underline{M}})(\eta) = 0 \tag{246}$$

and it means that we have

$$\eta = b\delta \qquad \begin{matrix} \text{with } b|\beta \in \Gamma\mathbb{G}_a. \\ \delta = \lambda_1 - \lambda_0 \end{matrix} \tag{247}$$

We shall set

$$\zeta = a_0\lambda_0 + a_1\lambda_1 \qquad a_0, a_1 \in \Gamma\mathbb{G}_a, \tag{248}$$

and we are going to express in terms of a_0, a_1, b the condition $\sigma'(\rho') = \rho'^{-1}$.

We have

$$\sigma'(\rho') = \mathrm{int}(\eta)\sigma(\zeta\rho) = \mathrm{int}(\eta)\left[\sigma(\zeta)\,\underbrace{\sigma(\rho)}_{\rho^{-1}\lambda_1}\right]$$

the condition $\sigma'(\rho') = \underbrace{\rho'^{-1}}_{\rho^{-1}\zeta^{-1}}$ is written

$$\sigma(\zeta)\rho^{-1}\lambda_1 = \eta^{-1}\rho^{-1}\zeta^{-1}\eta$$

i.e., multiplying on the left|left by ρ

$$\rho(\sigma(\zeta)) \,.\, \lambda_1 = \rho(\eta)^{-1}\zeta^{-1}\eta$$

or again, additively: 105

[scan 107]

[p. 701]

$$\underbrace{\rho_M \sigma_M}_{\varepsilon_{1M}}(\zeta) + \lambda_1 = -\rho_M(\eta) - \zeta + \eta \qquad \text{or again}$$

$$\underbrace{(1 + (\varepsilon_1)_M)(\zeta)}_{(2a_1 - a_0)\lambda_1} + \lambda_1 = \underbrace{(1 - \rho_M)(\eta)}_{3b\lambda_1}, \tag{249}$$

or again, by an immediate calculation

$$2a_1 - a_0 + 1 = 3b \qquad \text{or} \qquad 2a_1 - a_0 - 3b = \mid \neq -1. \tag{250}$$

This shows that for $\zeta \in \Gamma \underline{M}$ given (i.e. for ρ' given)[i2], for there to exist an η (i.e. $\sigma' | b$) satisfying with ζ these conditions (244) — i.e. [d1] such that $(\rho' = \zeta\rho, \sigma' = \eta\sigma)$ defines a splitting of (243) — it is necessary and sufficient that we have

$$2a_1 - a_0 + 1 \equiv 0 \qquad (3) \tag{251}$$

and then η is uniquely determined by (250), at least if 3 is a regular section of $\underline{\mathcal{O}}_S$ on the base S under consideration (which is the case if $S = \operatorname{Spec} \widehat{\mathbb{Z}}$).

Thus the splittings of (243) form a scheme $\underline{\mathrm{Sc}}$[i3] over S_0, which is [d2]given up to[i4] isomorphism by

$$\begin{aligned} \underline{\mathrm{Sc}} &\simeq \{(a_0, a_1, b) \in \Gamma \mathbb{E}^3 \mid 2a_1 - a_0 - 3b = -1\} \\ &\simeq \{(\zeta, \eta) \in \Gamma(M \times \underline{\mathbb{Z}\delta}) \mid (1 + \varepsilon_M)(\zeta) - (1 - \rho_M)(\eta) = -\lambda_1\} \end{aligned} \tag{252}$$

[d3]

This scheme is naturally a

torsor under the module scheme

$$\begin{cases} \underline{\mathrm{Sc}}_0 \simeq \underline{K}, \quad \text{where } K \text{ is the kernel of} \\ \qquad \text{the exact sequence of } \mathbb{Z}\text{-modules} \\ 1 \longrightarrow K \longrightarrow \mathbb{Z}^3 \longrightarrow \mathbb{Z} \longrightarrow 0. \\ \qquad (\alpha_0, \alpha_1, \beta) \longmapsto 2\alpha_1 - \alpha_0 - 3\beta \end{cases} \tag{253}$$

$K \simeq \mathbb{Z}^2$

On the other hand we have an operation of $\underline{M}$ on $\underline{\mathrm{Sc}}$ by automorphisms that are inner|that are inner, which I am going to make explicit; To $\lambda \in \Gamma\underline{M}$ corresponds the operation

$$(\zeta, \eta) \longmapsto \lambda\zeta\rho(\lambda)^{-1}, \lambda\eta\sigma(\lambda)^{-1}$$

i.e., additively

$$(\zeta, \eta) \longmapsto (\zeta + (1-\rho_M)(\lambda), \eta + (1-\sigma_M)(\lambda)). \tag{254}$$

Thus, the operation in question comes from the $\underline{\mathrm{Sc}}_0$-torsor structure on $\underline{\mathrm{Sc}}$, and from a homomorphism of Groups|groups

$$\begin{cases} \underline{M} \longrightarrow \underline{\mathrm{Sc}}_0 \\ \lambda \longmapsto (\underbrace{(1-\rho_M)(\lambda)}_{(c_0+c_1)\lambda_0+(2c_1-c_0)\lambda_1}, \underbrace{(1-\sigma_M)(\lambda)}_{(c_1-c_0)\delta}) \quad \text{where } \lambda = c_0\lambda_0 + c_1\lambda_1 \end{cases} \tag{255}$$

which is in fact a homomorphism of M-dules, associated with the homomorphism of $\mathbb{Z}$-modules

$$\begin{cases} M \longrightarrow K \hookrightarrow \mathbb{Z}^3 \\ c_0\lambda_0 + c_1\lambda_1 \longmapsto (\alpha_0 = c_0 + c_1, \alpha_1 = 2c_1 - c_0, \beta = c_1 - c_0) \end{cases} \tag{256}$$

[scan 109]

[p. 702]

We see at once that this homomorphism is universally injective (since the composite $M \longrightarrow \mathbb{Z}^3$ is), hence an isomorphism for reasons of rank. We have thus found:

Proposition The extension $\mathfrak{S}^+/\mu_{\mathfrak{S}}$ [i1] (243) of $(\mathfrak{S}_3)_{S_0}$ by $\underline{M}$ is split over S_0 — hence over every|every other base — the splittings over $S_0 = \mathrm{Spec}\,\mathbb{Z}$ correspond 1-1 [i2] to the splittings of $\mathfrak{S}^+/\mu_{\mathfrak{S}}$ as an extension of $\mathfrak{S}_3$ by M. Over an arbitrary base S, [d1] two [d2]splittings[i3] are conjugate

by a unique section of $\underline{M}$ over S, so the scheme of splittings of (243|247) is [d3] naturally a torsor under $\underline{M}$.

Let us note that it is immediate, over an arbitrary base S, that the splittings of (243) correspond one-to-one|one-to-one to the splittings of the extension of groups

$$1 \longrightarrow \underline{M}(S) \longrightarrow \underline{\mathfrak{S}}^{+}/\mu_{\mathfrak{S}}(S)^{\Delta} \longrightarrow \mathfrak{S}_3 \longrightarrow 1 \ , \tag{244}$$

which also identifies with the extension of 108

[scan 110]

$\mathfrak{S}_3$ by $\underline{M}(S) = \Gamma(S, \underline{\mathcal{O}}_S) \otimes_{\mathbb{Z}} M$, deduced from the universal extension $\mathfrak{S}^{+}/\mu_{\mathfrak{S}}$ of $\mathfrak{S}_3$ by M, via the homomorphism

$$M \longrightarrow \underline{M}(S) = M|\widehat{M} \otimes_{\mathbb{Z}} \Gamma(S, \underline{\mathcal{O}}_S) \ .$$

Let us apply this to the case $S = \mathrm{Spec}(\widehat{\mathbb{Z}})$, we find the

Corollary The extension $\mathfrak{S}^{+\wedge}/\mu_{\mathfrak{S}}$ of $\mathfrak{S}_3$ by $M^{\wedge}$ is split, and its splittings form a torsor under $M^{\wedge}$ (by automorphisms that are inner|that are inner)

Let us now study the splittings of $\underline{G}_{\rho,\sigma}/\underline{\mu}_G$ in its entirety i.e.|: by trying to determine, for a given splitting

$$(\rho' = \zeta\rho, \sigma' = \eta\sigma) \qquad \begin{cases} \zeta = a_0\lambda_0 + a_1\lambda_1 \\ \eta = b\delta = b(\lambda_1 - \lambda_0) \end{cases} \tag{257}$$

of $\underline{\mathfrak{S}}^{+}/\underline{\mu}_{\mathfrak{S}}$ over $(\mathfrak{S}_3)_{S_0}$, the liftings

$$\mathbb{O}_{12}^{*} \longrightarrow \underline{G}_{\rho,\sigma}/\underline{\mu}_G$$

compatible with the preceding splitting, i.e. which commute with ρ', σ'. For this 109

[scan 111]

[p. 703]

I|I am going to determine the commutant of (ρ', σ') [d1] in $\underline{G}_{\rho,\sigma}/\mu_\rho|\mu_G$, i.e. the commutant of the|of the partial section subgroup

$$(258) \qquad \underline{H}(\rho', \sigma') \subset \underline{G}_{\rho,\sigma}/\underline{\mu}_G.$$

The image of this commutant in $(\mathfrak{S}_3)_{S_0} \simeq (\underline{G}_{\rho,\sigma}/\underline{M})/\mathbb{O}_{12}^*$ is contained in the center of $(\mathfrak{S}_3)_{S_0}$, hence is trivial|trivial, whence we conclude

$$(259) \qquad \underline{\mathrm{Centr}}_{\underline{G}_{\rho,\sigma}/\underline{\mu}_G}(\underline{H}(\rho', \sigma')) \subset \mathbb{O}_{12}^* \,.\, \underline{M} \simeq \underline{G}_{\rho,\sigma}^{\natural|\sharp}$$

$$\left\{ \lambda u_{\underline{\mu}} \;\middle|\; \begin{array}{c} \lambda \in \Gamma \underline{M} \\ \| \\ \underline{\mu} \in \Gamma \mathbb{O}_{12}^* \end{array} \right\}$$

— where $u_{\underline{\mu}}$ is defined in (150,151). We are therefore going to determine the centralizer of $\underline{H}(\rho', \sigma')$ by expressing the condition for a $\lambda u_{\underline{\mu}}$ to lie in it, i.e. to commute with ρ', σ'.

We have:

$$(\lambda u_{\underline{\mu}})(\underbrace{\rho'}_{\zeta\rho}) = \mathrm{int}(\lambda)\, u_{\underline{\mu}}(\zeta\rho) = \mathrm{int}(\lambda)\, \underbrace{u_{\underline{\mu}}(\zeta)}_{\zeta^\mu}\, \underbrace{u_{\underline{\mu}}(\rho)}_{\lambda_1^\nu \rho} = \mathrm{int}(\lambda)(\zeta^\mu \lambda_1^\nu \rho)$$
$$= \lambda \zeta^\mu \lambda_1^\nu \rho(\lambda^{-1})\rho$$

where $\nu = \nu(\underline{\mu})$, so the relation $\lambda u_{\underline{\mu}}(\rho') = \rho'$ can also be written

$$\lambda \zeta^\mu \lambda_1^\nu \rho(\lambda^{-1})\rho = \zeta\rho \qquad \text{i.e.} \qquad \lambda \zeta^\mu \lambda_1^\nu \rho(\lambda^{-1}) = \zeta,$$

or in additive notation

$$\lambda + \mu\zeta + \nu\lambda_1 - \rho(\lambda) = \zeta, \qquad \text{i.e.}$$

taking into account that $\mu - 1 = 2\nu$ 110

Apparatus for this scan

140-4-s111-D001 *deletion. Manuscript:* of the|in

[scan 112]

$$(260) \qquad (1 - \rho)(\lambda) + 2\nu\zeta + \nu\lambda_1 = 0.$$

The relation $(\lambda u_{\underline{\mu}})(\sigma') = \sigma'$ becomes explicit, via

$$(\lambda u_{\underline{\mu}})(\sigma') = \mathrm{int}(\lambda) u_{\underline{\mu}}(\eta\sigma) = \mathrm{int}(\lambda) \begin{pmatrix} \underbrace{u_{\underline{\mu}}(\eta)}_{\eta^\mu} & \underbrace{u_{\underline{\mu}}(\sigma)}_{\substack{\omega^{\nu_2}\sigma = \sigma \\ \text{since } \omega = 1 \\ \text{in } \underline{G}_{\rho,\sigma}/\mu_G}} \end{pmatrix} = \lambda \eta^\mu \sigma \lambda^{-1}$$
$$= \lambda \eta^\mu \sigma(\lambda^{-1})\sigma$$

so the relation $\lambda u_{\underline{\mu}}(\sigma') = \sigma'$ [i1] is written

$$\lambda \eta^\mu \sigma(\lambda^{-1})\sigma = \eta\sigma \qquad \text{i.e.} \qquad \lambda \eta^\mu \sigma(\lambda^{-1}) = \eta$$

or again, additively

$$\lambda + \mu\eta - \sigma(\lambda) = \eta$$

$$(261|264) \qquad (1-\sigma)\lambda + 2\nu\eta = 0.$$

In terms of a_0, a_1, b of (257), these equations are made explicit as conditions on

$$\lambda = x\lambda_0 + y\lambda_1$$

by the equations

$$(262|282) \qquad \left\{ \begin{array}{rcll} -x+y & = & -2\nu b & \text{(expresses (261))} \\ \left.\begin{array}{rcl} x+y & = & -2\nu a_0 \\ -x+2y & = & -\nu(2a_1+1) \end{array}\right\} & & & \text{(express (260))} \end{array} \right. ,$$

where the quantities a_0, a_1, b appearing on the right-hand sides (in|at addition to the multiplicative factor $\nu = \nu(\underline{\mu})$) satisfy (250)

$$(263) \qquad -a_0 + 2a_1 - 3b + 1 = 0.$$

The first and third equation (262|263) can be solved for x, y

$$(264) \qquad \left\{ \begin{array}{l} y = \nu| - \nu(-2a_1 + 2b - 1) \\ x = y + 2\nu b = \nu(-2a_1 + 4b - 1) \end{array} \right.$$

and the second equation (262|261) becomes, on 111

is an isomorphism of sheaves [d1] $(\text{Sch})_{S_0}$, and hence (proposition page 702) the first is an $\underline{M}$ torsor via conjugation.

This statement is made explicit in a corresponding statement on the set-theoretic extensions, as in the Corollary to the preceding proposition. We find in particular, over $S = \text{Spec}(\widehat{\mathbb{Z}})$

Corollary The splittings of the extension $G_{\rho,\sigma}/\mu_G$ of $\widehat{\mathbb{Z}}^* \times \mathfrak{S}_3$ by $\widehat{M}$ form a torsor under $\widehat{M}$, isomorphic (by restriction)[i1] to the torsor of splittings of the extension $\mathfrak{S}^{+\wedge}/\mu_{\mathfrak{S}}$ [d2] of $\mathfrak{S}_3$ by $\widehat{M}$.

Variant of the preceding study for the extension $G_{\rho,\sigma}$ of $\mathbb{O}_{12}^* \times H_{S_0}^+$ by $\underline{M}$ (without division by $\underline{\mu}_{\underline{G}} = \{1, \omega\}_{S_0}$). Let us first consider the question of the splittings of the subextension $\underline{\mathfrak{S}}^+$ of $H_{S_0}^+$ by $\underline{M}$ — they|they correspond to the pairs 113

Scans 115–133

[scan 115]

[p. 705]

$$\begin{cases} \rho' = \zeta\rho,\ \ \sigma' = \eta\sigma \quad (\zeta, \eta \in \Gamma\underline{M}) \quad \text{such that we have} \\ \qquad\qquad \rho'^3 = \sigma'^2 = \omega, \qquad \sigma'(\rho') = \rho'^{-1}. \end{cases} \tag{267}$$

(We note|shall note that a splitting must transform ω, which operates trivially on $\underline{M}$ and is central in $\underline{H}^+$, into a central [d1] section[i1], now [d2] see|here is why we have

$$\begin{cases} \underline{M} \cap \underline{\mathrm{Cent}}(\underline{\mathfrak{S}}^+) = \underline{M}^{\mathfrak{S}_3} = \{1\}|\{0\}, \quad \text{hence} \\ \qquad \underline{\mathrm{Cent}}(\underline{\mathfrak{S}}^+) \simeq \underline{\mu}_{\underline{\mathfrak{S}}} = \{1, \omega\}_{\underline{\mathfrak{S}}} \end{cases} \tag{268}$$

— which shows that a splitting must transform ω into ω, whence easily the characterization (267) of the ρ', σ' corresponding|corresponding to a splitting). We shall have from this

$$\begin{cases} \rho'^3 = (\zeta\rho)^3 = \zeta\rho(\zeta)\rho^2(\zeta)\,\underbrace{\rho^3}_{\omega} = \zeta\rho(\zeta)\rho^2(\zeta)\omega \\ \sigma'^2 = (\eta\sigma)^2 = \eta\sigma(\eta)\,\underbrace{\sigma^2}_{\omega} = \eta\sigma(\eta)\omega \end{cases}$$

thus the [d4] equations $\rho'^3 = \omega$ and $\sigma'^2 = \omega$ are equivalent respectively to

$$\begin{cases} \zeta\rho(\zeta)\rho^2(\zeta) = 1 \quad \text{i.e.} \quad (1 + \rho_M + \rho_M^2)(\zeta) = 0 \\ \qquad \eta\sigma(\eta) = 1 \qquad\qquad \text{i.e.} \quad (1 + \sigma_M)(\eta) = 0 \end{cases}$$

i.e. this reduces to equations (245) (246), and we have seen that the [d5] [d6] condition[i2] on ζ is automatically satisfied, that on η amounts to:

$$(247) \qquad \eta = b\delta = b(\lambda_1 - \lambda_0), \quad \lambda|b \in \Gamma\mathbb{G}_a.$$

The condition $\sigma'(\rho') = \rho'^{-1}$ is made explicit on the other hand as on page 700′, we come back 114

[scan 116]

to equation (249), which is made explicit by (250). This shows that there exists a splitting even over $S_0 = \operatorname{Spec}\mathbb{Z}$ — which amounts to a splitting of the discrete group $\mathfrak{S}^+$ extension of $H^+ = \mathfrak{S}^+/M \simeq \mathfrak{S}_0/\Pi_0$ [i1] (by $M \simeq (\Pi_0)_{\mathrm{ab}}$) — and that the splittings in question form a torsor under $\underline{K}$, where $K \simeq \mathbb{Z}^2$ [i2] is defined in (253), and in fact [d1] we have an isomorphism $M \simeq K$ (254), i.e. $\underline{M} \simeq \underline{K}$, corresponding to the operation of $\underline{M}$ on the scheme of splittings, by conjugation. Thus we find

Proposition (Over an arbitrary base S).

The extension $\underline{\mathfrak{S}}^+$ of $\underline{H}^+$ by $\underline{M}$ is split — two splittings are conjugate by a unique section of $\underline{M}$ — thus the map [d2] "passage to the quotient by $\mu_{\mathfrak{S}}$" defines a bijection from the set of splittings of $\underline{\mathfrak{S}}^+$ over $\underline{H}^+$, onto the set of splittings of $\underline{\mathfrak{S}}^+/\mu_{\underline{\mathfrak{S}}}$ over $\underline{H}^+/\mu_{\underline{H}^+} \simeq \underline{\mathfrak{S}}_3$. 115

[scan 117]

[p. 706]

Let us now study the centralizer in $\underline{G}_{\rho,\sigma}$ of a section subgroup over $\underline{H}^+$, say denoted $\underline{H}(\rho', \sigma')$.

We must now have

$$\underline{\mathrm{Cent}}_{\underline{G}_{\rho,\sigma}}(\underline{H}(\rho',\sigma')) \subset \left\{ \lambda\omega^i u_{\underline{\mu}} \;\middle|\; \begin{array}{c} \lambda \in \Gamma\underline{M} \\ \underline{\mu} \in \Gamma\mathbb{O}^*_{12} \\ i \in \Gamma(\mathbb{Z}/2\mathbb{Z})_{S_0} \end{array} \right\} \qquad \begin{array}{c} \mathbb{O}^*_{12}\cdot(\underline{M}\times \underbrace{\mu_{\underline{\mathfrak{S}}}}_{=\{1,\omega\}_{S_0}}) \\ \| \end{array} \tag{269}$$

Moreover $\lambda\omega^i u_{\underline{\mu}}$ centralizes $\underline{H}(\rho',\sigma')$ iff $\lambda u_{\underline{\mu}}$ centralizes. Commutation with ρ' is again made explicit by condition (260), the calculation on page 703 applying ne varietur. For the condition of commutation with σ', the calculation on page 703′ must be modified for we can no longer write $\omega^{\nu_2}=1$, the condition is written

$$\omega^{\nu_2}\cdot\lambda\eta^{\mu}\sigma(\lambda^{-1})\sigma=\eta\sigma \quad \text{i.e.} \quad \omega^{\nu_2}\lambda\eta^{\mu}\sigma(\lambda^{-1})=\eta$$

and is equivalent to the conjunction of the condition

$$\nu_2(\underline{\mu})=0 \quad \text{i.e.} \quad \underline{\mu}\in\Gamma\mathbb{O}^{*\prime\prime}_{12}, \tag{270}$$

and of relation (261). In the presence of $\nu_2(\underline{\mu})=0$, the calculations on pages 703′, 704 apply, finally we find:

Corollary For every splitting of $\underline{\mathfrak{S}}^+$ over $\underline{H}^+$, [d1] [d2] let $\underline{T}$ be the centralizer [d3i1] in $\underline{G}_{\rho,\sigma}$ of the section subgroup $\underline{H}(\rho',\sigma')$, [d4] 116

[p. 707]

Let us make explicit a splitting of the extension $\mathfrak{S}^{+}$ of H^{+} by M — corresponding to a splitting of $\underline{\mathfrak{S}}^{+}$ of $\underline{H}^{+}$ by $\underline{M}$ — , via a particular solution of the equation

$$a_0 - 2a_1 + 3b - 1 = 0 \tag{273}$$

taking

$$a_1 = b = 0 \qquad \text{hence} \qquad a_0 = 1$$

i.e.

$$\begin{cases} \zeta = \lambda_0, \ \eta = 0 \quad \text{(additive notation)} \\ \rho' = \lambda_0 \rho, \quad \sigma' = \sigma \end{cases} \tag{274}$$

[d1] the three formulas give a splitting of $\mathfrak{S}^{+}/\mu_{\mathfrak{S}}$ [i1] over $\mathfrak{S}_3 \simeq H^{+}/\mu_{H^{+}}$. Let us make explicit the corresponding [d2]liftings[i2] of $\mathbb{O}_{12}^{*}$ into $\underline{G}_{\rho,\sigma}/\mu_G$ resp. of $\mathbb{O}_{12}^{*\prime\prime}$ into $\underline{G}_{\rho,\sigma}$;,

$$\begin{cases} u_{\rho',\sigma'} : \mathbb{O}_{12}^{*} \longrightarrow \underline{G}_{\rho,\sigma}/\mu_G \quad \text{resp.} \quad \mathbb{O}_{12}^{*\prime\prime} \longrightarrow \underline{G}_{\rho,\sigma} \\ \qquad \underline{\mu} \longmapsto \lambda_{\infty}^{\nu} u_{\underline{\mu}} \qquad (\nu = \nu(\underline{\mu})) \end{cases} \tag{275}$$

where $u_{\underline{\mu}}$ defined in (151). (N.B.§ (275) is contained in proposition page 704 (265) and (264), which give

$$u_{\rho',\sigma'} = \lambda u_{\underline{\mu}} \qquad \lambda = x\lambda_0 + y\lambda_1 \qquad x = y = -\nu$$
$$\text{hence} \qquad \lambda = -\nu(\lambda_0 + \lambda_1) = \nu\lambda_{\infty}.$$

We shall thus have, putting

$$u'_{\underline{\mu}} = u_{\rho',\sigma'}(\underline{\mu})$$

$$\left\{ \begin{array}{l} u'_{\underline{\mu}}(\rho') = \rho', \quad u'_{\underline{\mu}}(\sigma') = \sigma' \\ u'_{\underline{\mu}}(\lambda) = \mu\lambda \quad (\lambda \in \Gamma\underline{M}) \quad \text{where } (\mu = \chi(\underline{\mu})) \end{array} \right\} \quad \begin{array}{c} \text{(which suffices} \\ \text{to condition|characterize } u'_{\underline{\mu}}) \end{array} \tag{276}$$

[p. 709]
d1

We thus want to make $\mathcal{X}'$, which is a covering of $\mathcal{X}$, given by its fiber E at x_0 and the action of $\Pi = \Pi_1(\mathcal{X}, x_0)$ on E (by translations, thanks to an M torsor structure on E) into a covering of $(\mathcal{X}', \Gamma)$ — i.e. extend the given action of Π on the|the fiber E, to an action of $\mathcal{M}$ on E — which moreover necessarily factors through $\widetilde{\mathcal{M}}$. I say that this action necessaril^{y} goes by way of the affine group of the torsor E — to be precise, Γ operates on M, let γ_M be the operation defined by $\gamma \in \Gamma$, and let $g \in \widetilde{\mathcal{M}}$ be over $\gamma \in \Gamma$, we will thus have, for $x \in E$, $\lambda \in M$

$$\begin{array}{cccc} g & (\lambda & \cdot & x \quad) = \gamma_M(\lambda) \,.\, gx \\ \cap & \cap & & \cap \\ \widetilde{\mathcal{M}} & M & & E \end{array} \tag{280}$$

which is trivial by calculation. d6

$$g(\lambda.x) = (g\lambda)x = (g\lambda g^{-1}g)x = \underbrace{(g\lambda g^{-1})}_{\gamma_M(\lambda)}.(gx)$$

Moreover against all|all expectation we found that the extension $G_{\rho,\widetilde{\sigma}}$ of $\widehat{\mathbb{Z}}^* \times \mathfrak{S}_3$ by $\widehat{M}$ was split, whence it follows that [d1] the extension $\widetilde{\mathcal{M}}$. of Γ by $\widehat{M}$ is so too ([d2] this last fact[i1] is also a consequence of the existence of the Fermat tower, by applying to it the general reflections of the preceding pages). Better still, we have seen that there is a unique $\widehat{M}$-conjugacy class of splittings of the extension $G_{\rho,\widetilde{\sigma}}$, which induces a canonical (but not unique!) $\widehat{M}$-conjugacy class of [d3] splittings of $\widetilde{\mathcal{M}}$ over Γ. This therefore defines a canonical [d4] $\widehat{M}$-conjugacy[i2] class of liftings of the action of Γ on $\mathcal{X} = U_{0,3\overline{\mathbb{Q}}}$[i3] to $\mathcal{X}'_0$ – or what amounts to the same thing, a torsor on $(U_{0,3\mathbb{Q}}, \mathfrak{S}_3)$, with group a profinite group

m1568

Marginal note. [m1568] N.B. $H^1(\Gamma, \widehat{M})$ is a very big group! – But see below, cf. Theorem page 716

commutative over $(U_{0,3\mathbb{Q}}, \mathfrak{S}_3)$ which over [d1] $U_{0,3\overline{\mathbb{Q}}}$ is isomorphic[i1] to the covering $\mathcal{X}'_0$ considered above.

Let us return for a moment to this general case at the beginning. Note that the datum of a diagram (281) [d2] defines a quotient $\widetilde{\widetilde{\mathcal{M}}}$[i2] of $\widetilde{\mathcal{M}}$ – namely the coimage of $\Theta_{\widetilde{\mathcal{M}}}$ – [d3] such that $M \hookrightarrow \widetilde{\widetilde{\mathcal{M}}}$ is injective, and[i3] thus giving rise to an [d4] exact sequence

$$\begin{array}{ccccccccc} 1 & \longrightarrow & M & \longrightarrow & \widetilde{\widetilde{\mathcal{M}}} & \longrightarrow & \tilde{\Gamma} & \longrightarrow & 1, \\ & & & & & & \| \text{déf} & & \\ & & & & & & \widetilde{\widetilde{\mathcal{M}}}/\operatorname{Im} M & & \end{array} \tag{283}$$

then|where we have

$$\tilde{\Gamma} \hookrightarrow \operatorname{Aut}(M), \tag{284}$$

$\tilde{\Gamma}$ identifies with the image of Γ in $\operatorname{Aut}(M)$ under the action of Γ on M coming from the extension structure $\widetilde{\mathcal{M}}$ of Γ by M.

[d5] This quotient $\widetilde{\widetilde{\mathcal{M}}}$ of $\mathcal{M}$, giving rise to an extension (283), is not arbitrary – apart from the fact that M maps into it injectively, and that $\tilde{\Gamma} = \widetilde{\widetilde{\mathcal{M}}}/\operatorname{Im} M$ 127

[scan 129]

[p. 712]

operates [d1] faithfully[i1] on M : in addition, the extension (283) is trivial, and [d2] the fact[i2] that it comes from a $\Theta_{\widetilde{\mathcal{M}}}$ implies an additional structure on this extension, namely the datum of an M-conjugacy class of splittings.

More precisely, we will have a canonical map

$$E \longrightarrow \mathrm{Scind}(\widetilde{\widetilde{\mathcal{M}}} \text{ as|conceived extension of } \tilde{\Gamma} \text{ by } M) \tag{285}$$

compatible with the operations of M on E (by translation) and on Scind (by composition with|or inner automorphisms|automorphisms). The M-conjugacy class of splittings under consideration is none other than the image of E.[i3]

For x and $y \in E$ to have the same image in Scind, it is necessary and sufficient that the element $u = y - x \in M$ be in $M^\Gamma = M^{\tilde{\Gamma}}$, which shows that

$$\text{the homomorphism } E \longrightarrow \mathrm{Scind} \text{ is injective} \tag{286}$$
$$\text{iff} \quad M^\Gamma = \{0\} \quad .$$

In the case where $M^\Gamma = \{0\}$, we thus see that E identifies exactly with an M-conjugacy class of the splittings of $\widetilde{\widetilde{\mathcal{M}}}$. 128

[scan 130]

Let us sum up these considerations, in a

Proposition Let $\mathcal{X}$ be a [d1] connected locally connected topos equipped with a geometric point x_0, we place ourselves in the discrete context ($\mathcal{X}$ locally|locally simply|simply connected) or profinite (covering means profinite covering). [m1572]

Marginal note. [m1572]

We have a group Γ of automorphisms of $\mathcal{X}$ (Γ profinite in the profinite case — to do things properly we should spell out the reasonable hypotheses to be made to take account of the profinite topology of Γ…). We put

$$\Pi = \Pi_1(\mathcal{X}, x_0), \quad \mathcal{M} = \Pi_1(\mathcal{X}, \Gamma; x_0) \qquad \text{hence}$$

$$(*) \quad 1 \longrightarrow \Pi \longrightarrow \mathcal{M} \longrightarrow \Gamma \longrightarrow 1$$

[i1] we give ourselves a quotient M of Π, [d2] by a normal subgroup in $\mathcal{M}$, or what amounts to the same thing a quotient of $\Pi_{ab} = \Pi/[\Pi, \Pi]$ stable under the action of Γ, [d3]hence[i2] a [d4] quotient extension of $(*)$,

$$(287) \qquad 1 \longrightarrow M \longrightarrow \widetilde{\mathcal{M}} \longrightarrow \Gamma \longrightarrow 1$$

where M is commutative|commutative so Γ operates on M.

We are interested in the category of coverings [d5] $\mathcal{X}'$ of $(\mathcal{X}, \Gamma)$, satisfying the conditions 129

[p. 713]

Following : after forgetting the operations of Γ, we find a connected[i1] Galois covering (and even abelian)[i2] of $\mathcal{X}$, corresponding to the quotient group M of $\Pi = \Pi_1(\mathcal{X}, x_0)$ — so that $\mathcal{X}'$ becomes in a natural way a torsor under $M_{\mathcal{X}}$. m1574

Marginal note. m1574

The functor

$$\mathcal{X}' \longmapsto \mathcal{X}'(x_0) \qquad \text{(fiber at } x_0\text{)}$$

from the category of these $\mathcal{X}'$ to the category of sets, in fact goes to the sets E equipped with the following structures

a) E is an M-torsor, and as such gives rise to an extension

$$1 \longrightarrow M \longrightarrow \mathrm{Aff}(E) \longrightarrow \mathrm{Aut}(M) \longrightarrow 1$$

hence an induced subextension

$$1 \longrightarrow M \longrightarrow \mathrm{Aff}_\Gamma(E) \longrightarrow \tilde{\Gamma} \longrightarrow 1 \tag{288}$$

where

$$\tilde{\Gamma} = \mathrm{Im}(\Gamma \longrightarrow \mathrm{Aut}(M)).$$

b) We have a homomorphism of extensions

$$\begin{array}{ccccccccc} 1 & \longrightarrow & M & \longrightarrow & \widetilde{\mathcal{M}} & \longrightarrow & \Gamma & \longrightarrow & 1 \\ & & \Vert & & \downarrow{\scriptstyle \Theta_{\widetilde{\mathcal{M}}}} & & \downarrow{\scriptstyle \mathrm{can}} & & \\ 1 & \longrightarrow & M & \longrightarrow & \mathrm{Aff}_\Gamma(E) & \longrightarrow & \tilde{\Gamma} & \longrightarrow & 1 \end{array} \qquad (289)$$

The category of the $\mathcal{X}'$ (with isomorphisms…) is equivalent to that of [d1] pairs $(E, \Theta_{\widetilde{\mathcal{M}}})$, where E is an M-torsor, and $\Theta_{\widetilde{\mathcal{M}}}$ a homomorphism of extensions (289). 130

[scan 132]

The automorphisms of an object $\mathcal{X}'$ correspond to "translations" by elements of M^Γ= Cent($\widetilde{\mathcal{M}}$)[i1], (in the terms of $E, \Theta_{\widetilde{\mathcal{M}}}$) to translations of E by [d1] elements of M^Γ, [d2](in so far[i2] as elements of $\mathrm{Aff}_\Gamma(E)$ they are central, and by conjugating by these elements we find the same homomorphism $\Theta_{\widetilde{\mathcal{M}}}$…). [m1576]

Marginal note. m1576

The isomorphism classes of such elements d3correspondi3 one-to-one to the M-conjugacy classes of splittings of the extension (287) of Γ by $\widetilde{\mathcal{M}}$. In precise terms, to an $(E, \Theta_{\widetilde{\mathcal{M}}})$ is associated canonical|canonically a d4 homomorphism of M-sets

$$E \longrightarrow \mathrm{Scind}(\widetilde{\mathcal{M}} \text{ extension of } \Gamma \text{ by } M) \tag{290}$$

whose image is the conjugacy class describing the isomorphism class under consideration. d5The homomorphismi4 (290) is|of factored through $M^\Gamma\backslash E$ as a monomorphism

$$M^\Gamma\backslash E \hookrightarrow \mathrm{Scind}(\widetilde{\mathcal{M}} \text{ extension of } \Gamma \text{ by } M)\ , \tag{291}$$

and if $M^\Gamma = 0$, we see that E is canonically reconstructed from the class of 131

[p. 714]

conjugacy under consideration. The (affine)[i1] operation of $\widetilde{\mathcal{M}}$ on E (defined by $\Theta_{\widetilde{\mathcal{M}}}$)[i2] is none other than the operation [d1] (induced by the)[i3] conjugation on the set[i4] of splittings (which of course does not take one out of an M-conjugacy class, even when conjugating by arbitrary elements of $\widetilde{\mathcal{M}}$). [m1578]

Marginal note. [m1578]

Corollary Suppose we have

$$\underbrace{H^0(\tilde{\Gamma}, M)}_{M^\Gamma} = H^1(\tilde{\Gamma}, M) = 0 \tag{292}$$

i.e. that [d2] two splittings of a trivial extension of $\tilde{\Gamma}$ by M are conjugate by a unique element of M. This implies therefore (because of $M^\Gamma = \{0\}|0$)[i5] that the category of the $\mathcal{X}'$, or again that of the pairs $(E, \Theta_{\widetilde{\mathcal{M}}})$, is rigid, [d3] i.e. an object is known up to an isomorphism[i6] which is unique when we know its isomorphism class. This being so, the isomorphism classes in question [d4](i.e. the classes[i7] of [d5] conjugacy of the splittings of [d6] the extension $\widetilde{\mathcal{M}}$ of Γ by M) correspond one-to-one to the quotient groups $\widetilde{\widetilde{\mathcal{M}}}$ [m1579]

Scans 134–152

[scan 134]
m1581

Marginal note. m1581

of $\mathcal{M}$ satisfying the following conditions

a) $M \longrightarrow \widetilde{\widetilde{\mathcal{M}}}$ (composite $M \longrightarrow \widetilde{\mathcal{M}} \longrightarrow \widetilde{\widetilde{\mathcal{M}}}$) is injective,
d1

hence extension
(293)

$$1 \text{ — } M \text{ — } \widetilde{\widetilde{\mathcal{M}}} \text{ — } \underset{\overset{\text{dfn}}{=} \widetilde{\widetilde{\mathcal{M}}}/M}{\Gamma'} \text{ — } 1$$

b) d3 $\Gamma' \overset{\text{dfn}}{=} \widetilde{\widetilde{\mathcal{M}}}/M$ operates faithfully on M,
i.e. we have

$$\Gamma' \simeq \tilde{\Gamma} = \mathrm{Im}(\Gamma \longrightarrow \mathrm{Aut}(M)).$$

c) The extension $\widetilde{\widetilde{\mathcal{M}}}$ of $\Gamma' \simeq \tilde{\Gamma}$ by M is trivial (i.e. its class in $H^2(\tilde{\Gamma}, M)$ is zero).

For such a quotient $\widetilde{\widetilde{\mathcal{M}}}$of $\widetilde{\mathcal{M}}^{i2}$, we recover E as the set of all the splittings of the extension $\widetilde{\widetilde{\mathcal{M}}}$ of $\tilde{\Gamma}$ by M, [d4] on which we have $\widetilde{\mathcal{M}}$ operate via $\widetilde{\widetilde{\mathcal{M}}}$ by conjugation – the restriction of this operation to $M \subset \widetilde{\mathcal{M}}$ makes E an E-torsor (by hypothesis (292)).

Let us return again to the particular case that interests us. In the preceding number° (12°) we verified the [d5] relations (292), showing at the same time that this famous extension $G_{\rho,\tilde{\sigma}}$ of $\tilde{\Gamma} \simeq \widehat{\mathbb{Z}}^* \times \mathfrak{S}_3$ by $M^\wedge$ (denoted M in the general considerations) 133

[scan 135]

[p. 715]

was trivial, and that two splittings were conjugate by an element of M and only one (it is this second assertion of existence and uniqueness of conjugation that is the geometric content of (292)). Moreover, we have [d1] indeed constructed, in number° 11, a surjective homomorphism

$$\mathcal{M} = \mathcal{M}_{0,3} \longrightarrow G_{\rho,\tilde{\sigma}}$$

thus making $G_{\rho,\tilde{\sigma}}$ a quotient of $\mathcal{M}$ and even of $\widetilde{\mathcal{M}}$, which has the properties a) b) c) of the preceding corollary. This therefore defines for us, up to unique isomorphism, an object of the category of $\mathcal{X}'$, [d2] or what amounts to the same, a pro-étale covering of $(U_{0,3\,\mathbb{Q}}, \mathfrak{S}_3) \simeq M'_{1,1\,\mathbb{Q}}$, which after forgetting the operations of $\mathfrak{S}_3$ and extension of the base from $\mathbb{Q}$ to $\overline{\mathbb{Q}}$, becomes the universal abelian covering of $U_{0,3\,\overline{\mathbb{Q}}}$.

But on the other hand the tower of Fermat coverings provides us with quite exactly such an object – and if 134

Apparatus for this scan

140-4-s135-D001 *deletion. Manuscript:* thus
Text: omitted Reason: Cancelled in the manuscript: omission follows the author's final state; uncertainty in the cancelled material remains marked.

140-4-s135-D002 *deletion. Manuscript:* i.e. a pro-covering of

140-4-s135-I001 *insertion. Manuscript:* forgetting

Text: insertion integrated Reason: Explicit authorial insertion: integrated at the position recorded by the transcription, without changing its reading.

[scan 136]

I had not had this Fermat tower at my disposal, I certainly would not have suspected that d1 subextension $\mathfrak{S}^{+\wedge}/\mu_{\mathfrak{S}} = \widetilde{\mathfrak{S}}^{+\wedge}$ i1 d2 of $\widetilde{H}^{+} \simeq \mathfrak{S}_3$ by $M^{\wedge}$ was split!

m1584

Marginal note. m1584

The conjecture that presents itself at once is that these two pro-étale coverings are isomorphic – the isomorphism between the two is then unique.

d3 This is the moment to determine the isomorphism classes of the classes of splittings of the extension $\widetilde{\mathcal{M}} \simeq \mathcal{M}_{0,3}/[\widehat{\Pi}_{0,3}, \widehat{\Pi}_{0,3}]$ of i2 $\Gamma = \Gamma_{\mathbb{Q}} \times \mathfrak{S}_3$ by $M^{\wedge}$, we have by the exact sequence associated with the Hochschild spectral sequence

(294)

$$0 \longrightarrow H^1(\Gamma_{\mathbb{Q}}, H^0(\mathfrak{S}_3, \widehat{M})) \longrightarrow H^1(\Gamma, \widehat{M}) \longrightarrow H^0(\Gamma_{\mathbb{Q}}, H^1(\mathfrak{S}_3, \widehat{M})) \downarrow H^2(\Gamma_{\mathbb{Q}}, H^0(\mathfrak{S}_3, M))$$

Now we have seen that

$$(295) \qquad H^0(\mathfrak{S}_3, \widehat{M}) = 0 \qquad (\text{and } \overline{\mathrm{m}}\ H^0(L_\rho | L_j, \widehat{M} | \overline{M}) = 0)$$

m1585

Marginal note. m1585 hence $H^1(\Gamma, \widehat{M}) \simeq H^0(\Gamma_{\mathbb{Q}}, H^1(\mathfrak{S}_3, \widehat{M}))$

d5 Let us compute on the other hand

$$H^1(\mathfrak{S}_3, \widehat{M}) = H^1(\mathfrak{S}_3, M) \otimes_{\mathbb{Z}} \widehat{\mathbb{Z}},$$

[scan 137]

[p. 716]

which returns us to computing

$$H^1(\mathfrak{S}_3, M) \quad ?$$

But the study made of the extension $\mathfrak{S}^+/\mu_{\mathfrak{S}}$ of $\mathfrak{S}_3$ by M – which has shown us that this extension was split, and that two splittings were conjugate by a unique element of M, gives us in fact

$$(296) \qquad \begin{cases} H^0(\mathfrak{S}_3, M) = H^1(\mathfrak{S}_3, M) = 0 \\ H^0(\mathfrak{S}_3, \widehat{M}|\overline{M}) = H^1(\mathfrak{S}_3, \widehat{M}|\overline{M}) = 0 \end{cases} \text{hence} \quad ,$$

hence finally, thanks to (295), the triumphant relation

$$(297) \qquad \boxed{H^1(\Gamma_{\mathbb{Q}} \times \mathfrak{S}_3, \widehat{M}) = 0} \qquad !$$

We thus find – once again against all expectations, I confess! – the

ings pro-étale over $(U_{0,3\,\mathbb{Q}}, \mathfrak{S}_3) = M'_{1,1\,\mathbb{Q}}$, there exists a unique isomorphism from one onto the other.

We have obtained existence in two ways: by the Fermat tower, and by the general theory of § 49 III, applied to the present case – which gives us a U_∞ and a U'_∞, each described up to unique isomorphism! The uniqueness theorem follows from the preceding little calculation – I was afraid of the "big" [d1]

$$H^1(\Gamma_{\mathbb{Q}}, \widehat{M}) \simeq M \otimes_{\mathbb{Z}} \underbrace{H^1(\Gamma_{\mathbb{Q}}, T_{\infty|*}(G_m))}_{\widehat{\mathbb{Q}^*}},$$

but in the end it is the vanishing of $H^i(\mathfrak{S}_3, M)$ for $i = 0, 1$ that implies (without knowing anything about $\Gamma_{\mathbb{Q}}$!) that of $H^1(\Gamma_{\mathbb{Q}} \times \mathfrak{S}_3, \widehat{M})$, which ensures the uniqueness we needed. 137

[scan 139]

[p. 717]

[d1] The preceding theorem completely elucidates, it seems to me, the arithmetico-geometric meaning (in terms of the Fermat tower) of the homomorphism ((218) page 695')

$$\mathcal{M} = N^{\text{ét}}_{1,1} \longrightarrow G_{\rho,\sigma} \simeq \widehat{\mathbb{Z}}^* \cdot \mathfrak{S}^{+\wedge}_{\bullet|0}$$

obtained in section 11°) by purely algebraic means — or at least that of the slightly weaker homomorphism

$$\mathcal{M} \longrightarrow \overbrace{G_{\rho,\sigma}/\mu_{\mathfrak{S}}}^{G_{\rho,\widetilde{\sigma}} \overset{\text{dfn}}{=}} \simeq \widehat{\mathbb{Z}}^* \cdot \mathfrak{S}^{+\wedge}/\mu_{\mathfrak{S}}$$

which factors [d2] into a homomorphism

$$\underbrace{\widetilde{\mathcal{M}}}_{\text{denoted } \mathcal{M} \text{ in the preceding pages}} \overset{\text{dfn}}{=} \mathcal{M}/(\mu_{\mathcal{M}} = \mu_{\mathfrak{S}_{0|\bullet}}) \longrightarrow G_{\rho,\widetilde{\sigma}} \qquad \text{extension of } \tilde{\Gamma} = \widehat{\mathbb{Z}}^* \times \mathfrak{S}_3 \text{ by } M^\wedge.$$

The passage from $G_{\rho,\sigma}$ to $G_{\rho,\widetilde{\sigma}}$, from the present point of view, had as its essential role (a posteriori!) to provide an extension by $M^{\wedge}$ (playing the role of an identity component) of a group operating faithfully on $M^{\wedge}$, which was not the case for the extension $G_{\rho,\sigma}$ of $\widehat{\mathbb{Z}}^* \times H^+$ by $M^{\wedge}$, since the [d4] center $\mu_{H^+} = \{1, \omega_{H^+}\}$ [d5] of H^{+}[i3] operated trivially. 138

This, together with the relations

$$H^0(\widehat{\mathbb{Z}}^* \times \mathfrak{S}_3, \widehat{M}) = H^1(\widehat{\mathbb{Z}}^* \times \mathfrak{S}_3, \widehat{M}) = 0,$$

made it possible to interpret the group $G_{\rho,\widetilde{\sigma}}$ as a group of transformations on the set E of its own splittings, which made it possible to interpret the homomorphism $\mathcal{M} \to G_{\rho,\widetilde{\sigma}}$ (or $\widetilde{\mathcal{M}} \to G_{\rho,\widetilde{\sigma}}$) as an [d1] operation of $\mathcal{M}$ [d2] (or better, [d3]of $\widetilde{\mathcal{M}} = \pi_1(U_{0,3\mathbb{Q}}, \mathfrak{S}_3) = \pi_1(M'_{1,1\mathbb{Q}})$[i1] on E), thus corresponding to a pro-étale[i2] covering of $(U_{0,3\mathbb{Q}}, \mathfrak{S}_3) \simeq M'_{1,1\mathbb{Q}}$ — and this covering is none other than the Fermat pro-covering.

It remained to interpret in an analogous way the homomorphism $\boxed{\mathcal{M} = N_{1,1} \longrightarrow G_{\rho,\sigma}}$, fitting into the homomorphism of exact sequences

$$\begin{array}{ccccccccc}
 & & \mu_{\mathcal{M}} & & \mathcal{M} & & \widetilde{\mathcal{M}} & & \\
1 & \to & \| & \to & \| & \to & \| & \to & 1 \\
 & & (\{1,\omega\}) & & (N_{1,1}) & & (N'_{1,1} = \mathcal{M}_{0,3}) & & \\
 & & \downarrow \simeq & & \downarrow & & \downarrow & & \\
 & & \mu_G & & & & & & \\
1 & \longrightarrow & \| & \longrightarrow & G_{\rho,\sigma} & \longrightarrow & G_{\rho,\widetilde{\sigma}} & \longrightarrow & 1 \\
 & & \{1,\omega\} & & & & & &
\end{array} , \qquad (298)$$

[d4] which moreover makes it possible to interpret $\mathcal{M}$, as a central extension of $\widetilde{\mathcal{M}}$ 139

[p. 718]

by μ, as the inverse image of the extension $G_{\rho,\sigma}$ of $G_{\rho,\widetilde{\sigma}}$ by μ, under the preceding homomorphism $\widetilde{\mathcal{M}} \to G_{\rho,\widetilde{\sigma}}$. There is a striking analogy with what had happened, moreover, when we had started from (in § 48, and in|of certain developments which preceded it) from the quotient group ("of Lie type") $\mathrm{SL}(2,\widehat{\mathbb{Z}})'$ of $\mathfrak{S}_{0,3}^{+\wedge}$, to construct a homomorphism

$$\mathcal{M}_{0,3} \longrightarrow \mathrm{GL}(2,\widehat{\mathbb{Z}})/\{\pm 1\}$$

from which it was possible for us to reconstruct [d2] the extension $\mathcal{M} = N_{1,1}$ of $\mathcal{M}_{0,3}$ by μ precisely as the inverse image of the extension $\mathrm{GL}(2,\widehat{\mathbb{Z}})$ of $\mathrm{GL}(2,\widehat{\mathbb{Z}})/\{\pm 1\}$ by $\mu = \{\pm 1\}$. From the present point of view where I am trying to make arithmetic-geometric aspects as explicit as possible in terms of automorphisms of the profinite[i1] groups with loops $\Pi_{0,3}^{\wedge}$ — the remarkable fact is that the two 140

[scan 142]

extensions of $\widetilde{\mathcal{M}}$ by μ, coming out of apparently rather different calculations, are canonically isomorphic.

I presume that a general explanation of this fact will not present|would not present any difficulty, in the present context — because in both cases, the bi-[i1]covering of GL|SL$(2,\widehat{\mathbb{Z}})/\pm 1$

resp. of $G_{\rho,\widetilde{\sigma}}$ came from the fact that I had started from a quotient group ($\mathrm{SL}(2,\widehat{\mathbb{Z}})$ or $\mathfrak{S}^{+\wedge}$) not of $\mathfrak{S}^{+\wedge}_{0,3} \simeq \mathrm{SL}(2,\mathbb{Z})^\wedge/\pm 1$, but of $\mathrm{SL}(2,\mathbb{Z})^\wedge \simeq N_{1,1}$ itself —

If we nevertheless look for an interpretation (of the "Fermat tower" kind) of the homomorphism $\mathcal{M} \to G_{\rho,\sigma}$, it would be necessary to interpret $G_{\rho,\sigma}$ (as was $G_{\rho,\widetilde{\sigma}}$)[i2] as a group of automorphisms of a "typical fiber" "not too big" — the difficulty being to invent something on which that|it operates nontrivially. 141

[p. 719]

Interpreting $\mathcal{M}_{0,3} = N'_{1,1}$ as $\pi_1(M'_{1,1})$, where $M'_{1,1}$ is the modular scheme/$\mathbb{Q}$ of elliptic curves up to symmetry, we see that the Fermat tower amounts to this: over every base scheme S (say of characteristic 0[i1]) and every|every quasi-elliptic curve [d1]$\widetilde{X}$[i2] over S, let us consider the corresponding étale covering of degree three S' of S (of the[i3] "points of order 2 of $\widetilde{X}$"), [d2] let

$$M_0(\widetilde{X}/S|B) \overset{\text{dfn}}{=} p_*(\mathbb{Z}_{S'|B'})/\mathbb{Z}_S \tag{299}$$

be the corresponding twisted constant $\mathbb{Z}$-module free of rank [d4]two[i4], and let us consider

$$M_1(\widetilde{X}/S) \overset{\text{dfn}}{=} M_0(\widetilde{X}/S) \otimes_{\mathbb{Z}} \underbrace{\widehat{\mathbb{Z}}(1)}_{\| \text{ dfn } T_\infty(\mathbb{G}_m)} , \tag{300}$$

which is a pro-étale [d6]group over S, a system of coefficients locally isomorphic (in the broad sense) to $\widehat{\mathbb{Z}}^2$. [d7]Of[i6] course, $M_1(\widetilde{X}/S)$ depends functorially on $\widetilde{X}/S$ for isomorphisms and inverse images (we have a cartesian section of an ad-hoc fibered category ...). This being so, 142

[scan 144]

giving the "Fermat tower" is equivalent to giving, for $\forall\, \widetilde{X}/S$ as above, a torsor

$$F_\infty(\widetilde{X}/S) \quad \text{torsor over } S \text{ under } M_1(\widetilde{X}/S), \tag{301}$$

m1595

Marginal note. m1595 for a geometric construction cf. (320) page 724

compatible with isomorphisms and changes of base.

The preceding theorem says essentially that such an $F_\infty(\widetilde{X}/S)$ exists, and is unique up to unique isomorphism, requiring in addition that the natural homomorphism

$$\Pi_{0,3}^\wedge \longrightarrow M^\wedge$$

associated with such a datum F_∞ be the canonical homomorphism ....

On the other hand, let X be a relative elliptic curve over a base S of characteristic 0, and let $S' \subset X$ be the closed subscheme, étale of degree 3 over S, corresponding to the points of order 2. Let us consider the generalized Jacobian of X deduced from this multisection, let $\mathcal{J}^0$ be its part of degree 0, we thus have 143

[scan 145]

[p. 720]

an exact sequence

$$\begin{array}{ccccccccc} 1 & \longrightarrow & \mathcal{J}_0^0 & \longrightarrow & \mathcal{J}^0 & \longrightarrow & X & \longrightarrow & 1 \\ & & \wr\vert & & & & & & \\ & & \mathbb{G}_m \otimes_{\mathbb{Z}} M_0 & & & & & & \end{array} \tag{302}$$

where $M_0 = M_0(X/S)$ is defined above (299). From this we deduce an exact sequence

$$\begin{array}{ccccccccc} 1 & \longrightarrow & M_1 & \longrightarrow & T_\infty(\mathcal{J}^0) & \longrightarrow & T_\infty(X) & \longrightarrow & 1 \\ & & \| & & & & & & \\ & & M_0 \otimes_{\mathbb{Z}} T_\infty(\mathbb{G}_m) & & & & & & \end{array} \tag{303}$$

where

$$T_\infty(G) = \varprojlim_n {}_nG \tag{304}$$

is the local system of the Π_1 of the smooth commutative group scheme with connected fibers[i1] over S. Thus giving a torsor under M_1 is equivalent to giving a torsor under $T_{\infty|\alpha}(\mathcal{J}^0)$, equipped with a section of the associated torsor of the|of group $T_\infty(X)$. Is there|Is there a remarkable description of the Fermat torsor $F_\infty(X/S)$, in terms of the geometry of the relative elliptic curve X/S? 144

[scan 148]

$$H^{*|n}(S_0, \mathfrak{S}_3; \mathcal{J}^0) \Longleftarrow H^p(\mathfrak{S}_3, \underline{H}^q(S_0, \mathcal{J}^0)) \quad (E_2^{pq} =)$$

which gives the exact sequence

$$0 \to H^1(\mathfrak{S}_3, H^0(S_0, \mathcal{J}^0)) \xrightarrow{\dagger|\simeq} H^1(S_0, \mathfrak{S}_3; \mathcal{J}^0) \longrightarrow H^0(\mathfrak{S}_3, H^1(S_0, \mathcal{J}^0))$$
$$(H^{0|q}(\mathfrak{S}_3, M_0 \otimes_{\mathbb{Z}} H^1(S_0, \mathbb{G}_m))) \qquad H^2(\mathfrak{S}_3, H^0(S_0, \mathcal{J}^0))$$

Now we have

$$H^1(S_0, \mathcal{J}^0) \simeq H^1(S_0, \mathbb{G}_m^2) \simeq \mathrm{Pic}(S|S_0)^2 = 0$$

m1603

Marginal note. m1603 N.B. we do not need the relation $\mathrm{Pic}(S) = 0$

hence we get

$$H^1(S_0, \mathfrak{S}_3; \mathcal{J}^0) \simeq H^1(\mathfrak{S}_3, \underbrace{H^0(S_0, \mathcal{J}^0)})$$

But in fact, the calculations made elsewhere show that we have

$$H^0(\mathfrak{S}_3, M_{0|\alpha} \otimes_{\mathbb{Z}} I|I_0) = H^1(\mathfrak{S}_3, M_{0|\alpha} \otimes_{\mathbb{Z}} I) = 0 \tag{309}$$

for any $\mathbb{Z}$-module I (for example $I = J^0|\mathcal{J}^0(S)$, S an arbitrary|arbitrary scheme, or $I = H^1(S, \mathbb{G}_m) = \mathrm{Pic}(S)$[i2]), whence finally,

$$H^0(\dagger|S, \mathfrak{S}_3; \mathcal{J}^0) \simeq H^1(S, \mathfrak{S}_3, \mathcal{J}^0) = 0 \tag{310}$$

for $\forall$ scheme S. We thus find: 147

We assume 2 invertible on S, so that the datum of X modulo ω_X[i1] corresponds, by the Legendre carpet $X \mapsto (X/\{1, \omega_X\})$, to the datum of a (Y, S') as above, with in addition a section of $U = Y - S'$.

In fact, the datum of (Y, S') amounts to the datum of S', i.e. of an $\mathfrak{S}_3$-torsor[i3 d2] T over S — and Y is recovered from there|it as the twisted scheme $T \wedge_{\mathfrak{S}_3} \mathbb{P}^1_S$ [d3] with

$$U = Y \setminus S' \simeq (T \wedge_{\mathfrak{S}_3} \mathbb{P}^1_S) \setminus \underbrace{T \wedge_{\mathfrak{S}_3} \{0, 1, \infty\}_S}_{S'}$$

canonically embedded in

$$T \wedge_{\mathfrak{S}_3} \mathcal{J}^0_{(U_{0,3})_S} \simeq \mathcal{J}^0_{U/S}.$$

The embedding $U \subset \mathcal{J}^0_{U/S}$ can also be interpreted as a canonical morphism

$$X \longrightarrow \mathcal{J}^0_{U/S} \underbrace{= \mathcal{J}^0_{0\,X/S} | \mathcal{J}^0_{X/S}}_{\substack{\text{with|in notation} \\ \text{of page 720}}} \tag{318}$$

which should be easy to characterize axiomatically

[p. 724]

ment, [d1] or to make explicit in terms of standard "elliptic functions".

Without dwelling on such an explicitation, and returning rather[i1] to the corresponding embedding

$$U \hookrightarrow \mathcal{J}^0_{U/S} \tag{318}$$

and to the marked section

$$e \in U(S) = H^0(S, \mathcal{J}^0_{U/S}), \tag{319}$$

we can use the tower of isogenies[i2] [d2]

[d3]

$$1 \longrightarrow {}_n\mathcal{J}^0_{U/S} \hookrightarrow \mathcal{J}^0_{U/S} \xrightarrow{n.\mathrm{id}_{\mathcal{J}^0_{U/S}}} \mathcal{J}^0_{U/S} \longrightarrow 1 \tag{321}$$

(for varying n), i.e. the universal isogeny deduced by passage to $\varprojlim$:

$$\begin{array}{ccccccccc} 1 & \longrightarrow & T_\infty(\mathcal{J}^0_{U/S}) & \longrightarrow & \widetilde{\mathcal{J}}^0_{U/S} & \xrightarrow{p} & \mathcal{J}^0_{U/S} & \longrightarrow & 1 \\ & & \wr\downarrow & & \| \text{ def} & & & & \\ & & T_\infty(\mathbb{G}_m)_S \otimes_{\mathbb{Z}} M_0(S'/S) & & \varprojlim_n {}_n(\mathcal{J}^0_{U/S}) & & & & \end{array} \tag{322}$$

to deduce, by inverse image of e, a torsor under $T_\infty(\mathcal{J}^0_{U/S}) \simeq T_\infty(\mathbb{G}_m)_S \otimes_{\mathbb{Z}} M_0(S'/S)$. This being so, we will have (cf. (301) page 719')

$$(323) \qquad F_\infty(\widetilde{X}/S) \simeq p^{-1}(e), \quad \text{the } T_\infty(\mathcal{J}^0_{U/S})\text{-torsor}$$

Remark The isomorphism class of the $T_\infty(\mathcal{J}^0_{U/S})$-torsor obtained is an element of $H^1(S, T_\infty(\mathcal{J}^0_{U/S}))$, image of the element e of $H^0(S, \mathcal{J}^0_{U/S})$, under the canonical morphism

$$(324) \qquad H^0(S, \mathcal{J}^0) \longrightarrow H^1(S, T_\infty(\mathcal{J}^0)) \ ,$$

whose kernel consists of the subgroup of $H^0(S, \mathcal{J}^0)$ of "infinitely divisible" elements. In the case where S is reduced and is[i1] of finite type over [d1] $\mathbb{Z}$ – for example reduced[i2] of finite type over $\mathbb{Q}$ – we know (and this is [d2] "elementary") that this kernel is reduced to zero. This therefore means that the section e of U over S[i3] (i.e. the "elliptic parameter" under consideration) is then entirely determined, when one knows 153

[p. 725|726]

Fermat curves. From the present point of view, where we are trying to make explicit the algebraic geometry of essential[ly][i1] finite type over $\mathbb{Q}$ in terms of automorphisms of profinite groups, we can also say, conversely, that we have managed to "describe" the tower of Fermat curves, via the homomorphism (327) constructed here "by brute force".

It would now remain to find an arithmetico-geometric explicitation of the homomorphism [d1] from $\Gamma_{\mathbb{Q}} \subset \Gamma^{\text{ét}}_{\mathbb{Q}}$[i2] into $\widehat{\mathbb{Z}}^*.\widehat{\mathbb{Z}}$, induced by (326). But [d2] using the embedding (

$$N^{\natural|\sharp}_{\sigma} \hookrightarrow G^{\natural|\sharp}_{\rho,\sigma} \simeq \widehat{\mathbb{Z}}^*.\underline{M} \ ,$$

the homomorphism (313|323) appears as the composite

$$\Gamma^{\text{ét}}_{\mathbb{Q}} \xhookrightarrow[\kappa_{1/2}]{} \mathcal{M}^! \xrightarrow[\text{i.e. "Fermat"}]{(325)} G^{\natural|\sharp}_{\rho,\sigma} \ ,$$

more precisely we have a commutative diagram: 156

[scan 160]

Thus, the homomorphism (329) should be interpretable in terms of the Galois homomorphism

$$\Gamma_{\mathbb{Q}} \longrightarrow \operatorname{Gal}(\widetilde{\mathbb{Q}}[\sqrt[\infty]{-\tfrac{1}{2}}]/\mathbb{Q}) \tag{336}$$

where $\widetilde{\mathbb{Q}}$ denotes the universal cyclotomic extension of $\mathbb{Q}$

$$\widetilde{\mathbb{Q}} \simeq \mathbb{Q}[\sqrt[\infty]{1}]. \tag{336}$$

To appreciate the "size" of the image of $\Gamma_{\mathbb{Q}}$ in $\widehat{\mathbb{Z}}^*.\widehat{\mathbb{Z}} \simeq N_\sigma^{\natural|\sharp}$, it is appropriate to make a digression of a general nature, on the Galois groups over $\mathbb{Q}^{i1}$ of extensions of the form

$$\widetilde{\mathbb{Q}}[\sqrt[\infty]{\zeta_1|\xi_1}, \dots, \sqrt[\infty]{\zeta_N|\xi_N}].$$

For this, over a base $S/\mathbb{Q}$, we have for simplicity (we will be|restrict ourselves here reduced|restricted to the case $S = \operatorname{Spec}\mathbb{Q}$) let us give ourselves an abelian group A (in^{i2} the case that interests us here we will take $A = \mathbb{Z}$), and 159

[p. 728] a homomorphism

$$A \xrightarrow{\zeta|\xi} \mathbb{G}_m(S) = H^0(S, \mathbb{G}_{mS}) \tag{337}$$

(in the present case, it is given by $1 \mapsto -1/2$), or what amounts to the same thing, a homomorphism

$$A_S \xrightarrow{\zeta|\xi} \mathbb{G}_{mS}. \tag{338}$$

Let us consider the tower of Kummer isogenies

$$1 \longrightarrow \mu_n \longrightarrow \mathbb{G}_m \xrightarrow{\lambda \mapsto \lambda^n} \mathbb{G}_m \longrightarrow 1 \tag{339}$$

whence, by inverse image via (338), a tower of extensions of étale group schemes over S

$$1 \longrightarrow \mu_n \longrightarrow E_n(\zeta|\xi) \longrightarrow A_S \longrightarrow 1 \tag{339}$$

and by passage|passage to the $\varprojlim$

$$1 \longrightarrow T_\infty(\mathbb{G}_{mS}) \longrightarrow E_\infty(\zeta|\xi) \longrightarrow A_S \longrightarrow 1. \tag{340}$$

Let us suppose S is 0-[i2]connected, and take a [d3] geometric point $\bar{s}$[i3] of S, we will therefore have a canonical homomorphism

$$\Pi_1(S, \bar{s}) \longrightarrow \operatorname{Aut}_{\substack{\text{gr} \\ \text{profinite}}}(E_\infty(\zeta|\xi)_{\bar{s}}), \tag{341}$$

[p. 729]

where the image [d1] of $G_{\zeta|\xi} \longrightarrow \widehat{\mathbb{Z}}^*$ consists of the $\mu \in \widehat{\mathbb{Z}}^*$ such that the homothety,[i1] μ_T does not change the class of the extension (342) of A by T. The homomorphism (341) can thus be interpreted as fitting into a diagram

$$\begin{array}{ccccccc} 1 & \longrightarrow & \mathrm{Hom}_{\mathbb{Z}}(A, T_\infty(\bar{k}^*)) & \longrightarrow & G_{\zeta|\xi} & \longrightarrow & \widehat{\mathbb{Z}}^* \\ & & & & \uparrow{\scriptstyle \gamma_{\zeta|\xi}} & \nearrow_{\text{commutative}} & \\ & & & & \Pi_1 & \text{cyclotomic character"} & \end{array} \tag{346}$$

N.B.

If S is essentially of finite type over $\mathbb{Q}$, then the image of $\Pi_1 \longrightarrow \widehat{\mathbb{Z}}^*$ is an open subgroup of $\widehat{\mathbb{Z}}^*$, hence the same is a fortiori true of the image of $G_{\zeta|\xi} \longrightarrow \widehat{\mathbb{Z}}^*$ — which will even be surjective if the cyclotomic character on Π_1 is surjective, i.e. if [d2] the only roots of 1 on S are ± 1 (for example if $S = \mathrm{Spec}\,\mathbb{Q}\,...$).

The diagram (346) has an an obvious functoriality property for variable A (say), i.e. for a 162

[scan 165]

[p. 730]

study in the case where $j|\zeta$ is injective

$$j|\zeta : \quad A \hookrightarrow \mathbb{G}_m(S) \ . \tag{350}$$

[d1] One can moreover, "divide" the diagram (346) a little further, by introducing

$$\Pi_1^+ = \Pi_1^+(S,\bar{s}) \overset{\text{def}}{=} \mathrm{Ker}(\Pi_1(S,\bar{s}) \xrightarrow{\text{cyclot.}} \widehat{\mathbb{Z}}^*), \tag{351}$$

and the homomorphism of exact sequences

$$\begin{array}{ccccccc} 1 & \longrightarrow & \Pi_1^+ & \longrightarrow & \Pi_1 & \xrightarrow{\chi_\Pi} & \widehat{\mathbb{Z}}^* \\ & & \downarrow{\scriptstyle \gamma^+_{\zeta|\xi}} & & \downarrow{\scriptstyle \gamma_{\zeta|\xi}} & & \downarrow{\scriptstyle 1} \\ 1 & \longrightarrow & \mathrm{Hom}_{\mathbb{Z}}(A,T) & \longrightarrow & G_{\zeta|\xi} & \longrightarrow & \widehat{\mathbb{Z}}^*. \end{array} \tag{352}$$

One can consider that the study of the "size" of $\mathrm{Im}(\gamma_{\zeta|\xi} : \Pi_1 \longrightarrow G_{\zeta|\xi})$ is essentially reduced to that of the size of $\mathrm{Im}\,\chi_\Pi$ and of that of $\mathrm{Im}\,.\gamma^+_{\zeta|\xi}$; precisely, if we put

$$\mathrm{Im}\,\gamma_{\zeta|\xi} = \widetilde{\Pi}_1, \quad \mathrm{Im}\,\gamma^+_{\zeta|\xi} = \widetilde{\Pi}_1^+, \quad \mathrm{Im}\,\chi_\Pi = \Gamma \tag{353}$$

we will have an exact sequence

$$1 \longrightarrow \widetilde{\Pi}_1^+ \longrightarrow \widetilde{\Pi}_1 \longrightarrow \Gamma \longrightarrow 1 \ . \tag{354}$$

I would like to try to give some 164

Apparatus for this scan

indications on the size of $\widetilde{\Pi}_1^+ \underset{\zeta|\gamma}{\subset} \underbrace{\mathrm{Hom}(A,T)}_{\simeq \mathrm{Hom}(A,\widehat{\mathbb{Z}})}$ in the case where we assume

noncanonical^t|noncanonical!

$$\begin{cases} 1^\circ) & A \quad \mathbb{Z}\text{-module of finite type} \\ 2^\circ) & S \quad \text{essentially}^{t|l} \text{ of finite type over } \mathbb{Q} \text{ and } \underline{\text{normal}} \\ 3^\circ) & j|\zeta : A \longrightarrow \mathbb{G}_m(S) \text{ is injective .} \end{cases} \tag{355}$$

The hypothesis 2°) already implies as we have seen, that $\Gamma \subset \widehat{\mathbb{Z}}^*$ is an open subgroup. The hypothesis that S is normal implies moreover that the groups sought $\widetilde{\Pi}_1^+$ and Γ do not change on^h|on$^{t\text{i}2}$ on replacing S by its generic point (we assume for simplicity that $\bar{s}$ is above the said generic point), so suppose that $S = \mathrm{Spec}\, K$, where K is a field[i3] extension of finite type of $\mathbb{Q}$. And one can also assume, if one cares to, that S is affine, and smooth over $\mathbb{Q}$ ....

Let us also note, putting

$$\check{A} = \mathrm{Hom}_{\mathbb{Z}}(A, \mathbb{Z}), \tag{356}$$

[scan 167]

[p. 731]

that $\check{A}$ is a free $\mathbb{Z}$-module of finite type (of rank n[i1] equal to $\mathrm{rg}_{\mathbb{Z}} A$), and that we have a canonical isomorphism

$$\mathrm{Hom}_{\mathbb{Z}}\left(A, \underbrace{T}_{\simeq\widehat{\mathbb{Z}}\ (\text{noncanonical}^t|\text{noncanonical!})}\right) \simeq \underbrace{\check{A}\otimes_{\mathbb{Z}} T}_{\check{A}(-1)} \quad \left(\begin{array}{c}\simeq \widehat{\mathbb{Z}}^n \\ \text{noncanonical}^t|\text{noncanonical!}\end{array}\right) \tag{357}$$

I would be inclined to think that the image [d1] $\widetilde{\Pi}_1^+$ of Π_1 in $\mathrm{Hom}_{\mathbb{Z}}(A,T) \simeq \check{A}\otimes_{\mathbb{Z}} T$ is open. I even wonder, in the case S_1 normal 0-connected[i2] of finite type over $\mathbb{Z}$, dimension $2| \geq 2$[i3] and $A = H^0(S_1, \mathbb{G}_m)$, putting $S = S_{1\mathbb{Q}}$, whether the homomorphism

$$\Pi_1 = \Pi_1(S, \bar{s}) \longrightarrow \mathrm{Hom}(A,T) \simeq \check{A}(-1)$$

is not necessarily surjective??

(More generally, this may be so if $\mathbb{G}_m(S)/\operatorname{Im} A$ is torsion-free, a case to which one should always be able to reduce, under the hypothesis (355), at the cost of enlarging A to $A' \subset H^0(S, \mathbb{G}_m)$, to|or an A' such that A'/A is finite…). 166

[scan 168]

I will return to the case $S = \mathrm{Spec}\,\mathbb{Q}$, then [d1]

$$\mathbb{G}_m(S) = \mathbb{G}_m(\mathbb{Q}) = \mathbb{Q}^* \simeq \{\pm 1\} \times \mathbb{Z}^{(\mathbb{P})}$$

where $\mathbb{P}$ is the set of prime numbers,

$$\Pi_1 = \mathrm{Gal}(\overline{\mathbb{Q}}/\mathbb{Q}) = \Gamma_{\mathbb{Q}}.$$

The question is thus to study the homomorphisms

$$\xi|\zeta_p : \Gamma_{\mathbb{Q}}^+ \longrightarrow \widehat{\mathbb{Z}}(-1) \tag{358}$$

associated to the $p \in \mathbb{P}$, and in particular to answer the questions

a) are the $\xi|\zeta_p$ surjective, or at least is the image an open subgroup?

b) are the $\xi|\zeta_p$ linearly independent over $\widehat{\mathbb{Z}}$? More precisely, if $p_1 \ldots p_n$ are distinct prime numbers, is the homomorphism

$$\Gamma^+_{\mathbb{Q}} \xrightarrow{(\xi|\zeta_{p_1},\dots,\xi|\zeta_{p_n})} \widehat{\mathbb{Z}}^n(-1|1)$$

surjective, or at least is the image of $\Gamma^+_{\mathbb{Q}}$ an open subgroup?

I will start by looking a little at question a) (the case at which we were in the context of Fermat was the one where $p = 2$). For this, we decompose $\xi|\zeta_p$ into its components

$$\xi|\zeta_{p,\ell} : \Gamma^+_{\mathbb{Q}} \longrightarrow \widehat{\mathbb{Z}}_\ell(-1|1) \qquad (\ell \in \mathbb{P}) \tag{359}$$

167

[scan 169]

[p. 732]

I would therefore like to prove (at least!)[i1] that these are surjective homomorphisms, or at least surjective except for a finite number of ℓ, and with open image for $\forall \ell$. To study $\xi|\zeta_{p,\ell}$ is to restrict oneself to the tower of isogenies

$$1 \longrightarrow \mu_n \longrightarrow \mathbb{G}_m \xrightarrow{\lambda \mapsto \lambda^n} \mathbb{G}_m \longrightarrow 1 \tag{339}$$

for n a power of ℓ

$$n = \ell^\nu, \tag{360}$$

and study [d1]the tower of[i2] inverse images of $p \in \mathbb{G}_m(\mathbb{Q})$ under its isogenies. It is natural then to look at "the" decomposition group

$$D_\ell = \{\sigma \in \Pi_1(\mathbb{Q}_\ell, \overline{\mathbb{Q}}_\ell) \hookrightarrow \Gamma_{\mathbb{Q}} \tag{361}$$

and the cyclotomic ℓ-adic[i3] character induces

$$D_\ell \xrightarrow{\chi_\ell} \mathbb{Z}^*_\ell \ , \tag{362}$$

or better, the inertia subgroup

$$I_\ell \subset D_\ell \tag{363}$$

and the character induced by χ_ℓ on I_ℓ. Indeed we will have

$$I^+_\ell \overset{\text{def}}{=} \mathrm{Ker}(\chi_\ell : I_\ell \longrightarrow \mathbb{Z}^*_\ell) \subset \Gamma^+_{\mathbb{Q}} \tag{364}$$

for the $\chi_{\ell'}$ $(\ell' \neq \ell)$ are trivial on I_ℓ (they are not trivial however on D_ℓ!). 168

[p. 733]

16°) Reflections on Fermat's theorem.

"Fermat's theorem" can be stated by saying that for $n \geq 3$, the affine Fermat curve over $\mathbb{Q}$

$$\begin{aligned} U_n &\overset{\text{def}}{=} \left\{ (x_0, x_1, x_\infty)^{\cdot} \in \Gamma\mathbb{P}^2 \;\middle|\; \begin{array}{c} x_0, x_1, x_\infty \text{ inv.} \\ x_0^n + x_1^n + x_\infty^n = 0 \end{array} \right\} \\ &\simeq \left\{ (x_0, x_1|a_1, x_\infty|a_\infty)^{\cdot} \in \Gamma\mathbb{G}_m^{\{0,1,\infty\}}/\mathbb{G}_m \;\middle|\; x_0^n + x_1^n + x_\infty^n = 0 \right\} \end{aligned} \tag{366}$$

has no d2 rational point /$\mathbb{Q}$. We had introduced d3the i2 "tower" of Fermat curves in §11°) (page 696 and following), and in 14°) there appeared the description of U_n as the inverse image of

$$\begin{array}{l} U_1 \subset \overbrace{\mathbb{G}_{m_{\mathbb{Q}}} \otimes_{\mathbb{Z}} M}^{T} \simeq \mathbb{G}_{m_{\mathbb{Q}}}^{\{0,1,\infty\}}/\mathbb{G}_{m_{\mathbb{Q}}} \\ \| \\ \left\{ (x_0, x_1, x_\infty)^{\cdot} \in \Gamma\mathbb{G}_m^{\{0,1,\infty\}}/\mathbb{G}_m \;\middle|\; x_0 + x_1 + x_\infty = 0 \right\} \end{array} \tag{367}$$

under the Kummer isogeny of index n

$$1 \longrightarrow \mu_n \otimes_{\mathbb{Z}} M \longrightarrow T \xrightarrow{x \mapsto x^n} T \longrightarrow 1 \ . \tag{368}$$

Let us calculate the genus g_n i3 of $\widehat{U}_n$, which is a covering of degree n^2 of $\widehat{U}_1 \underset{*|\neq}{\simeq} \widehat{\mathcal{U}|\mathcal{M}}_{0,3}$, with i4d5 ramification d6of degree n at i5 the points above i6 $0, 1, \infty$, and étale elsewhere. The Hurwitz formula

gives
d1

$$\underbrace{\underbrace{(2-2g_n)}_{\text{EP of } \widehat{U}_n} - 3n}_{\text{EP}_!\text{ of } U_n} = n^2 \left(\underbrace{\underbrace{\underset{\sim}{2}}_{\text{EP of } \widehat{U}_1} - 3}_{\text{EP of } U_1} \right)$$

i.e.

$$2(g_n - 1) = n^2 - 3n \qquad \text{i.e.}$$

$$(369) \qquad g_n = 1 + \frac{1}{2} n(n-3)$$

So we have

$$(370) \qquad g_1 = g_2 = 0, \quad g_3 = 1, \quad g_n > 1 \quad \text{if } n \geq 4.$$

In any event, all the U_n are anabelian, and even the $\widehat{U}_n$ for $n \geq 4$.

If the "anabelian"[i3] yoga developed in the first part of these notes is valid, the [d5] [d6] rational/$\mathbb{Q}$ points of a curve U_n [d7] correspond[i4] to the splittings of the extension of profinite groups (371)

$$1 \to \Pi_1(U_{n\overline{\mathbb{Q}}}) \to \underset{\substack{\cap \\ \Pi_1(U_1)\simeq M^!_{0,3}}}{\Pi_1(U_n)} \to \Gamma_{\mathbb{Q}} \to 1$$

which are distinct from the "splittings at infinity" (localized at the 3n[i6] points at infinity of U_n…), or again, the splittings such that the centralizer of[i7] ($\Gamma^+_{\mathbb{Q}} = \mathrm{Ker}(\Gamma_{\mathbb{Q}} \overset{\chi}{\to} \widehat{\mathbb{Z}}^*)$) in $\Pi_1(U_n)$ is reduced to $\{1\}$. So – if the "theorem

[p. 734]

of Fermat" is indeed valid (for U_n, say), it should be reflected|reflected in the nonexistence of such a splitting. Besides, if we succeeded in proving the nonexistence of splittings of (371) other than those "coming from the points at infinity", the theorem of Fermat would be proved for U_n, even without having established the "anabelian yoga" (a proof of which seems quite out of reach!). Now it is by no means excluded that a sufficiently thorough analysis of $M_{0,3}$ and $N_{1,1}$ in the present direction – also involving finer and finer "approximations" of $\Pi_1(U_n)$ and of the extension structure (371), might eventually make it possible to prove the nonexistence of "nontrivial" splittings of (371), for all $n \geq 3$. Each new refinement of the "Lie approximations" of $M_{0,3}$ should lead to a reexamination of the situation (371) and of the question of its splittings, with a view to a possible proof of the "theorems of Fermat".

[scan 174]

It is imperative to start from Lie approximations at least as fine as those|that of the present §, which appears as the "minima" approximation in which one can express "algebraically" the tower of Fermat curves, [d1] as we saw in 13°), starting from $M_{0,3} \subset M_{0,3}^{\text{ét}}$.

Taking into account the operations of $\mathfrak{S}_3$ on U_n, the exact sequence (371) moreover embeds in a richer exact sequence

(372)

$$1 \to \Pi_1(U_{n\overline{\mathbb{Q}}}) \to \underset{\Pi_1(U_1,\overset{\cap}{\mathfrak{S}_3})\simeq M_{0,3}}{\Pi_1(U_n,\mathfrak{S}_3)} \to \Gamma_{\mathbb{Q}} \times \mathfrak{S}_3 \to 1,$$

and the calculations made in the present § seem to suggest that this richer extension structure will play an important role.

From the point of view of the Lie approximation of $M_{0,3}$ developed in the present §, it is appropriate to replace the extension structure (372) by a less fine quotient structure, by dividing by an invariant subgroup of $\Pi_1(U_n, \mathfrak{S}_3)$ contained in

[p. 736]

modulo [d1] $\widehat{M}[n]$-conjugation implies that of the corresponding splitting of $\mathcal{E}_1$, hence implies knowledge of the corresponding point x_1 [i1] of $U_1(\mathbb{Q})$ [d2], which means that x_n is known modulo the operation of $\gamma_n = \mu_n(\mathbb{Q})^{\{0,1,\infty\}}/\mu_n(\mathbb{Q})$. Now we have

$$\gamma_n \overset{\text{dfn}}{=} \mu_n(\mathbb{Q})^{\{0,1,\infty\}}/\mu_n(\mathbb{Q}) = 1 \quad \text{if } n \text{ odd} \tag{378}$$

for $\mu_n(\mathbb{Q}) = 1$ if n odd – so in this case x_n is known when one knows the corresponding splitting, and even only its $\widehat{M}[n]$-conjugacy class.

This leads us to determine all these possible $\widehat{M}[n]$-conjugacy classes of such splittings, in order to examine (if it can be done) which ones can reasonably correspond to an $x_n \in U_n(\mathbb{Q})$. These classes correspond to the elements of

$$H^1(\Gamma_{\mathbb{Q}}, n\widehat{M}) \simeq H^1(\Gamma_{\mathbb{Q}}, \widehat{M}) \simeq \underbrace{H^1(\Gamma_{\mathbb{Q}}, \widehat{\mathbb{Z}}(-1))}_{(\mathbb{Q}^*)^\wedge|(\mathbb{Q}^*]^\wedge} \otimes_{\mathbb{Z}} M \simeq G(\mathbb{Q})^\wedge \tag{379}$$

where

$$G \overset{\text{dfn}}{=} \mathbb{G}_{m\,\mathbb{Q}}|G_{m\,\mathbb{Q}}{}^{\{0,1,\infty\}}/\mathbb{G}_m|G_m$$

is the torus of dimension 2 over $\mathbb{Q}$ in which the U_n are embedded. We see that everything happens as if we were studying simply the existence (!) and the cohomological locating of the $\mathbb{Q}$-rational points of G itself – without concerning ourselves with the equation $x_0^n + x_1^n + x_\infty^n = 1$ which defines U_n. This shows plainly that the approximation on which we are working is much too coarse – in fact, in practice we remain in the domain of a typically "abelian" analysis. It is clear that it is necessary to pass to finer approximations.

[scan 179]

[p. 737]

52 Schematic envelopes of|of the L-groups.

1°) Notion of L-group, of LT-group (discrete case).

The notion of L-group is the natural generalization of that of "group with loops", which is called for if we want to be able to encompass mixed fundamental groups of orientable surfaces (of "finite character", i.e. homeomorphic to an $X \setminus S$, X a compact surface, S a finite subset) with a finite group of automorphisms.

We have seen that if Π is a group with loops (discrete), then every subgroup of finite index Π_0 inherits a loop structure, taking as "loop subgroups" of Π_0 the intersections with Π_0 of the loop subgroups of Π. [N.B. we assume that we are not in the cases (g, ν) [d1] with $g = 0$, $\nu \in \{0, 1\}$, where the loop structure is not[i1] determined by the sole datum of a family of conjugacy classes of subgroups [d2] ($\simeq \mathbb{Z}$) – the only[i2] case that would cause a problem here

is the case $(0,1)$ of $\Pi \simeq \mathbb{Z}$ [i1] – in the case $(0,0)$, we have $\Pi = \{1\}$ and $\Pi_0 = \Pi \dots]$. Conversely, the loop structure of Π is recovered from that of $\Pi_{0*}|\Pi_0$ (when it exists!), the loop subgroups of Π being the centralizers in Π of the loop-subgroups of Π_0. [d1]

Let Π be a discrete group, [d2i2] [d3] and let $\mathcal{L}_0(\Pi)$ be the set of group-with-loops structures on Π, of type (g,ν) [d4]anabelian i.e. $\neq$[i3] $(0,0|1), (0,1), (1,0)$. For the subgroups [d7] Π_i of Π[i6] of finite index, the $\mathcal{L}_0(\Pi_i)$ form an inductive system [d8] of sets. [d9] If Π_i is normal,

we [d11] set|take

$$(1) \qquad \mathcal{L}_0^{\natural|\sharp}(\Pi_i) = \text{set of loop structures on } \Pi_i \text{ invariant under } G_i = \Pi/\Pi_i.$$

[d13] If there exists a Π_{i_0} of finite index such that $\mathcal{L}(\Pi_{i|i_0}) \neq \emptyset$, then Π_{i_0} hence also Π admits a finite generating set, and it follows that the set of normal[i7] subgroups of finite index is cofinal in the set of subgroups of finite index. We shall then set

$$(2) \qquad \mathcal{L}(\Pi) = \varinjlim_{\substack{\Pi_i \text{ normal} \\ \text{of finite index} \\ \text{in } \Pi}} \mathcal{L}_0^{\sharp|\sharp}(\Pi_i).$$

m1635

Marginal note. m1635 N.B. If Π_i is not normal in Π, we can define $\mathcal{L}_0^{\natural|\sharp}(\Pi_i)$ as the subset of $\mathcal{L}(\Pi_i)$ formed by the loop structures λ[i1] "invariant under Π", i.e. such that for $\forall g \in \Pi$, we have that λ (on Π_i) and $\mathrm{int}(g)|\mathrm{Int}(g)\lambda$ (on $\mathrm{int}(g)|\mathrm{Int}(g)(\Pi_i)$) coincide in $\Pi_i \cap \mathrm{Int}(g)|\mathrm{int}(g)(\Pi_i)$ (which is of finite index in Π ...)

[d1] the canonical morphisms (Π_i normal of finite index in Π)

$$(3) \qquad \mathcal{L}_0^{\natural|\sharp}(\Pi_i) \longrightarrow \mathcal{L}(\Pi)$$

are injective. If $\lambda \in \mathcal{L}(\Pi)$, we say that λ is an L-structure. on Π, (Π, λ) is called an L-group,[i2] (and if $\lambda \in \mathrm{Im}(\mathcal{L}_0^{\natural|\sharp}(\Pi_i) \to \mathcal{L}(\Pi))$), we say that Π_i is a subgroup of definition of the L-group Π – we regard it as a group with loops via the unique $\lambda_i \in \mathcal{L}_0^{\natural|\sharp}(\Pi_i)$ giving rise to λ.

Let Π be a discrete group, $\Pi_0'|\Pi_0$ a subgroup of Π of finite index. Then we have a canonical homomorphism for induction of L-structures

$$(4) \qquad \mathcal{L}|\mathcal{L}_0(\Pi) \hookrightarrow \mathcal{L}(\Pi')$$

which is injective, and whose image consists of the set of L-structures on Π' that are

"invariant under Π" in an obvious sense. In particular, if we have an extension of a finite group G[i1] by a discrete group Π_0, then the L structures on Π correspond to the L-structures on Π_0 invariant under $\Pi/\Pi_0 \longrightarrow \mathrm{Autext}(\Pi_0)$, operating on the set of L-structures of Π in an obvious way. [N.B. $\Pi \mapsto \mathcal{L}(\Pi)$ is a functor in the outer groups Π, with outer isomorphisms as arrows ...]

Standard example: let X be an anabelian surface "of finite character" 0-connected[i3], G a finite group operating on X,

$$\Pi = \Pi_1(X, G; \bullet) \qquad (5)$$

where a is a base point of X, so that we have an exact sequence

$$\begin{array}{ccccccccc} 1 & \longrightarrow & \Pi_0 & \longrightarrow & \Pi & \longrightarrow & G & \longrightarrow & 1. \\ & & \| & & & & & & \\ & & \Pi_1(X, \bullet) & & & & & & \end{array} \qquad (6)$$

We then have on Π_0 a loop structure

invariant under the outer operations of G, hence an L-structure on Π. It seems that $\forall$ L-group is isomorphic to a group obtained this way — but this is a result that seems deep (essential[ly] equivalent to that of|of the the existence[i1] of[i2] fixed points of finite subgroups of Teichmüller groups ...), and which is not completely understood. We should bring out[i3] a general "good statement", linking the 2-category of L-groups, with that of surfaces X of finite character, [d1i4] equipped with a|with a "signature" $\underline{d}$[i5] with finite[d2] support (with values in $\mathbb{N}^*$) punctured[i6], by associating to such a surface its $\Pi_1(X, \underline{d}, a)$, relative to a point [d3] $a \in X - \operatorname{supp} \underline{d}$. Excluding a few singular cases "trivial"[i7], we should then find an L-group Π, isomorphic to a $\Pi_1(X; G, a)$,|; with G operating faithfully, which should[i8] be expressed

in terms of Π by the fact that the centralizer of $\forall$ subgroup of finite index in Π is reduced to $\{e\}$. This|This should give a complete intrinsic[i1] description, in topological terms, of the L-groups having this additional property. There would then still be some work of fitting together to do, in terms of certain extensions of such L-groups by finite groups, to treat|find the general case. Moreover, we should make the connection with the associated "L-Galois topoi", paraphrasing the corresponding developments on Galois topoi etc. associated to groups with loops.

[scan 185]

[p. 740]

It could be that the "right" general context for defining and studying general Teichmüller groups is that of L-groups, rather than that of groups with loops.

Taking for example the group [d1]

$$\begin{aligned} \mathfrak{S}^{+}_{0,3} &\simeq \mathrm{Sl}(2,\mathbb{Z})/\{\pm 1\} \\ &\simeq \Pi_1(U_{0,3}(\mathbb{C}), \mathfrak{S}_3; -\bar{j}), \end{aligned} \tag{4}$$

this is equipped with an L-structure, which can be defined in terms of the unique conjugacy class of the subgroup L_0[i1] generated by $\varepsilon_0 = \begin{pmatrix} 1 & -1 \\ 0 & 1 \end{pmatrix}$, or of L_1 generated by $\varepsilon_1 = \begin{pmatrix} 1 & 0 \\ 1 & 1 \end{pmatrix}$. The L-group (discrete)[i2] has the remarkable property that every L-[i3]automorphism "direct" (inducing the identity on the orientation module)[i4] of it is inner. It could be that this property, added to the property that the center is trivial (or better, perhaps, that the centralizer

of every subgroup of finite index is reduced to $\{1\}$) characterizes $\mathfrak{S}^+_{0,3}$ up to (nonunique) isomorphism.

N.B. To prove that every direct L-[i1]automorphism|automorphism u[i2] of $\mathfrak{S}^+_{0,3}$ is inner, the essential point seems to me to be to prove that u preserves the subgroup $\Pi_{0,3}$, kernel of

$$1 \longrightarrow \Pi_{0,3} \longrightarrow \mathfrak{S}^+_{0,3} \longrightarrow \mathfrak{S}_3 \longrightarrow 1.$$

In fact, every automorphism of the group structure of $\mathfrak{S}^+_{0,3}$ (not necessarily an L-automorphism|automorphism) preserves the normal subgroup $\Pi_{0,3}$. This follows from the

Lemma Let $\Pi \subset \mathfrak{S}^+_{0,3}$[i3] be a normal subgroup such that $\mathfrak{S}^+_{0,3}/\Pi \simeq \mathfrak{S}_3$, then $\Pi = \Pi_{0,3}$. More precisely, every surjective homomorphism $p : \mathfrak{S}^+_{0,3} \longrightarrow \mathfrak{S}_3$ is conjugate to the canonical homomorphism (hence its kernel is $\Pi_{0,3}$).

Proof [d4] We use the presentation[i4] of $\mathfrak{S}^+_{0,3}$ by $\rho^3 = \sigma^2 = 1$,

[scan 187]

[p. 741]

which implies that a homomorphism p from $\mathfrak{S}^+_{0,3}$ to another group, whose image is not of order $1, 2$ or 3 i.e. of order ≥ 4, sends ρ and σ resp. to elements of order 3 and of order 2. So if the image is $\mathfrak{S}_3$, ρ is sent to $\dot\rho$ or $\dot\rho^{-1}$ (we may suppose, conjugating if necessary by $\dot\sigma_\infty$,[i1] that it is $\dot\rho$) and σ is sent to $\dot\sigma_0, \dot\sigma_1$ or $\dot\sigma_\infty$ (we may suppose, conjugating by $\dot\rho$ or $\dot\rho^2$ if necessary, that it is $\dot\sigma_\infty$), and we win.

We may call the Teichmüller group of an L-group Π, the group of its outer L-automorphisms — or perhaps, better, the group of outer L-automorphisms of the subgroup Π^+ (of index 1 or 2) of Π, consisting of the $g \in \Pi$ such that the automorphism $\mathrm{int}(g)$ is direct. The property envisaged for $\mathfrak{S}^+_{0,3}$ is that its "direct" Teichmüller group is reduced to 1. The property

Apparatus for this scan

[scan 188]

corresponding to this for the L-[i1]group $\mathfrak{S}_{0,3} \simeq \mathrm{Gl}(2,\mathbb{Z})/\pm 1$ is that every [d1] L-[i2]automorphism of the subgroup $\mathfrak{S}^+_{0,3}$ is induced by a unique element of $\mathfrak{S}_{0,3}$. This property is perhaps characteristic of the discrete L-group $\mathfrak{S}_{0,3}$.

I feel like presenting in a slightly different form the notion of L-groupΠ,[i3] in terms of the datum of a $\mathbb{Z}$-module T free of rank 1 (the $\mathbb{Z}$-module of orientations) and of a[d2] [d3] finite set[i4] $(k_i^{\natural|\sharp})_{i\in I}$ of germs of homomorphisms that are outer

$$k_i^{\natural|\sharp} : \quad T \longrightarrow \Pi \qquad (i \in I) \qquad \text{(germ of outer homomorphism)} \tag{5}$$

,

where the notion of "germ" is relative to that of subgroups of finite index of T. [d5] For such a datum,[i6]

[p. 742]

and any subgroup [d1] Π_0 of Π of finite index, we find for $\forall i$[i1] a set of germs of outer homomorphisms

$$T \longrightarrow \Pi_0$$

induced by the actual homomorphisms [d2] $nT \longrightarrow \Pi$ of the class $k_i^{\natural|\sharp}$ — we find a finite number of germs of outer homomorphisms $T \longrightarrow \Pi_0$ for fixed i, hence also for i varying in I. This said, the only axiom of an L-structure, it is that we can find a subgroup Π_0 of finite index, such that the "induced structure" comes from a loop structure on Π_0.

We can generalize the notion of L-structure, taking inspiration from the preceding definition (for example), and dropping the requirement there that Π_0 be of finite index — but while

structure – linked to a class of discrete subgroups commensurable with one another – of [d1]*L-T-*[i1]groups. (where L is the initial of "loops", and T of "Teichmüller") – these are sorts of mixtures of Teichmüller groups and L-groups. To illustrate this point, let us start from an extension

$$(6) \qquad 1 \longrightarrow \Pi \longrightarrow \mathcal{G} \longrightarrow \mathcal{T} \longrightarrow 1$$

where Π is equipped with an L-structure invariant under $\mathcal{G}$, then $\mathcal{G}$ is an L-T-group admitting (if Π is itself a [d2]group with loops) Π as a subgroup of definition. Starting from the group with loops Π, one can take for example

$$(7) \qquad \begin{cases} \mathcal{G} = \mathrm{Aut}_L(\Pi) \\ \mathcal{T} = \mathrm{Autext}_L(\Pi) \end{cases} \qquad \text{whence}\,,$$

2°) Profinite case

The extension of the notion of an L-group or of an LT-group Π[i1], in terms of germs of outer homomorphisms

$$(8) \qquad k_i^{\natural|\sharp} : T \longrightarrow \Pi \ ,$$

is essentially evident. Here is the most important example for us. [d1]

Let first k be a field [d2], and let M be an [d3] [d4] algebraic multiplicity over k, which is 0-connected,[i2] of finite type over k, [d5] separated/k and smooth in|of relative dimension 1. One should be able to prove then that M can be described by a smooth and quasi-projective algebraic curve U over k, a finite group [d6] G which operates on U, [d7] as

$$(9) \qquad M = (U, G) = \begin{array}{l} \text{(small) Ringed topos of} \\ \text{étale sheaves on} \\ U \text{ where } G \text{ operates} \ldots \end{array}$$

d1 – More intrinsically, it should be true that there exists a finite étale covering of M (which one can suppose Galois, with group G) d2 which is an|a d3scheme[i1] – which will necessarily be quasi-projective|quasi-projective, smooth, of relative dimension 1 over k. Let us suppose in any case that this is so, choose a geometric base point a of M, and consider

$$\Pi = \Pi_1(M, a) \simeq \Pi_1(U|M, G; a)\,. \tag{10}$$

We shall henceforth suppose k of characteristic zero. Let us first suppose k algebraically closed. Using the exact sequence

$$1 \longrightarrow \underbrace{\Pi_1(U, a)}_{\Pi_0} \longrightarrow \underbrace{\Pi_1(U|M, G; a)}_{\Pi} \longrightarrow G \longrightarrow 1 \tag{11}$$

and the natural d4 loop structure on Π_0, one finds an L-structure on $\Pi = \Pi_1(M, a)$, which manifestly does not

depend on the choice of the finite[i1] Galois étale covering U of M, and on the chosen lifting of the geometric point a of M to a geometric point of U. We shall always tacitly[i2] equip $\Pi = \Pi_1(M, a)$ with this L-structure.

If again k is an arbitrary field (the most interesting case being the one where k is an extension of finite type of $\mathbb{Q}$), we shall have an exact sequence

$$1 \longrightarrow \Pi_1(M_{\overline{k}}, a) \longrightarrow \Pi_1(M, a) \longrightarrow \Gamma_{\overline{k}/k} \longrightarrow 1 \tag{12}$$

and $\Pi_1(M_{\overline{k}}, a|o)$ appears as equipped with an L-structure invariant under $\Pi_1(M, a|o) = \Pi$, so that Π appears as a TL-group.

I am particularly interested in the "universal" case of type (g, ν) – but the natural[i3] base is not then the

[p. 746]

We shall therefore have an exact sequence

$$(13)\quad 1 \to \widehat{\Pi}_{g,\nu} \to \underbrace{\Pi_1(U|M_{g,\nu_{\mathbb{Q}}})}_{\mathcal{M}_{g,\nu}} \to \underbrace{\Pi_1(M_{g,\nu_{\mathbb{Q}}})}_{\mathcal{N}_{g,\nu}} \to 1,$$

where $U_{g,\nu_{\mathbb{Q}}}$ is the "universal curve of|of the type g,ν" (in characteristic 0). Here it is $\Pi_1(U_{g,\nu}\dagger|\xi_{\mathbb{Q}})$ which appears as a profinite TL-group.

I would like to bring out a property common to this "universal" case (13), [d2] [d3] and to the case 1-multiplicity|of 1 multiplicity [illeg. 1] relative[i1] to a base field k an extension of finite type of $\mathbb{Q}$ (the first case reducing moreover essentially to the second, by taking a "generic point" of $M_{g,\nu}$…). For this, let us consider an LT-group $\mathcal{M}|\mathcal{A}$, and a [d4] homomorphism

$$k_i : T \longrightarrow \mathcal{M}$$

belonging to one of the $k_i^{\natural|\sharp}$. One can

for example choose a normal subgroup of definition Π in $\mathcal{M}$, which will therefore be a group with loops, [d1] an exact sequence

$$(14)\quad 1 \to \Pi \to \mathcal{M} \to \mathcal{N} \to 1,$$

and a homomorphism

$$(15)\qquad k : T \hookrightarrow \Pi\ , \qquad k(T) \overset{\text{dfn}}{=} L$$

relative to the loop structure of Π. Let us consider the normalizer of $L|T$ in $\mathcal{M}$

$$(16)\qquad \mathrm{Norm}_{\mathcal{M}}(L) \overset{\text{dfn}}{=} N(L)$$

and consider the action of $N(L)/L \subset \mathcal{N}$ [d2] on L. (N.B. One readily sees that the image of $N(L)/L$ in $\mathcal{N}$ is an open subgroup of $\mathcal{N}$…) This action is by a "cyclotomic character", induced by a character

$$(17)\qquad \mathcal{N} \xrightarrow{\chi_{\mathcal{N}}} \widehat{\mathbb{Z}}^*\ .$$

The essential hypothesis is that the image

Apparatus for this scan

[p. 747]

of $\mathcal{N}$ under χ (or also of $N(L)/L$ under χ) is an open subgroup of $\widehat{\mathbb{Z}}^*$. This hypothesis has a character intrinsic to the LT-group $\mathcal{M}$ itself (independently of the choice of Π) — for the cyclotomic character

$$(18) \qquad \chi_{\mathcal{M}} : \mathcal{M} \longrightarrow \widehat{\mathbb{Z}}^*$$

has a character intrinsic to $\mathcal{M}$, and the hypothesis means that the image of the latter in $\widehat{\mathbb{Z}}^*$ is open.

Returning to L and $N(L)$, one sees that the hypothesis made|made implies this:

(19) Every open subgroup of $N(L)/L$ operates nontrivially on L.

One knows, by standard|standard arguments that this implies that for every [d2] field K [d3] (in particular an ℓ-adic field $\mathbb{Q}_\ell$),

affine of finite type G over $\mathbb{Z}$, then we have

$$(25) \qquad G(\mathcal{A}_{\mathbb{Q}}) \simeq (|\{(x_\ell)_{\ell \in \mathbb{P}} \in \prod_{\ell} G(\mathbb{Q}_\ell) \mid x_\ell \in G(\mathbb{Z}_\ell) \text{ for almost tt}|\forall \ell\}$$

d1

We give ourselves in addition a homomorphism

$$(26)\quad G_{\mathbb{Q}} \xrightarrow{\chi_G} \mathbb{G}_{m\mathbb{Q}}|G_{m\mathbb{Q}}.$$

We are interested in [d2]some[i1] group homomorphisms

$$(27)\quad \mathcal{M} \longrightarrow G(\mathcal{A}_{\mathbb{Q}})$$

satisfying properties which we are going to enumerate.

1°) Continuity. This is equivalent to saying that *a*) the homomorphisms $\mathcal{M} \longrightarrow G(\mathbb{Q}_\ell)$ are continuous|continuous, and *b*) $\exists S$ a finite subset of $\mathbb{P}$, such that for $\ell \notin S$, one has [d3] a factorization (continuous)

$$(28)\quad \mathcal{M} \longrightarrow G(\widehat{\mathbb{Z}}_\ell) \qquad (\ell \in \mathbb{P} \setminus S)$$

— condition which indeed does not depend on the chosen "model over $\mathbb{Z}$" G of $G_{\mathbb{Q}}$.

N.B. (28) is a homomorphism of profinite groups.

I do not require for the moment that it be isomorphic to this completion itself. Thus idem|item for $\mathcal{T}$ and $\mathcal{T}_0$. The group $\mathcal{T}_0 = \mathcal{G}_0/\Pi_0$ plays the role of a discrete "direct"[i2] Teichmüller group, the group $\mathcal{T}$ that of a completion of a Teichmüller group, the group $\Gamma = \mathcal{M}/\mathcal{G}$ plays the role of a profinite Galois group. [d1] I am interested mainly in two extreme situations

a) $\mathcal{G}_0 = \Pi_0$ whence $\mathcal{G} = \Pi$ — situation coming from a smooth relative 1-multiplicity over a field [d2] extension of finite type of $\mathbb{Q}$, or more generally [d3]over a[i3] scheme (or a multiplicity)[i4] integral of finite type over $\mathbb{Q}$, [d4]$\mathcal{N}\tilde{\to}$ | $\simeq\Gamma$ is[i5] [d5] the fundamental group of the said [d6] scheme or of the said multiplicity,

b) $\mathcal{G}_0/\Pi_0 \simeq$ Teichmüller group of Π_0 or of finite index in this Teichmüller group[i6] — in this case, one is interested mainly in a "modular" situation, where

Scans 210–228

[scan 210]

The system of groups over $\mathbb{Q}$[i1] (36, 37), equipped with the homomorphism from

$$\Pi \subset \mathcal{G} \subset M$$

into [d1]

$$(40) \qquad \underline{\Pi}_{\mathbb{Q}}(\mathbb{A}'_{\mathbb{Q}}) \subset \underline{\mathcal{G}}_{\mathbb{Q}}(\mathbb{A}_{\mathbb{Q}}) \subset \underline{M}_{\mathbb{Q}}(\mathbb{A}_{\mathbb{Q}})$$

[d2] induced[i2] by $M \longrightarrow G(\mathbb{A}_{\mathbb{Q}})$ (satisfying conditions 1°) to 4°) above [d3], i.e. of a "Lie homomorphism") will also be called a "Lie approximation" of the Galois-Teichmüller system under consideration.

Consider a [d4]homomorphism

$$(41) \qquad k_i \quad T_0 \longrightarrow \Pi_0$$

belonging|corresponding to the L-structure of Π, thus defines by composition with $\Pi_0 \longrightarrow \underline{\Pi}(\mathbb{Q})$[i3] a [d8]homomorphism

$$(42) \qquad T_0 \longrightarrow \underline{\Pi}(\mathbb{Q}).$$

m1639

Marginal note. [m1639] N.B. for fixed i, k_i is determined modulo inner automorphisms of Π_0 and modulo composition with $n\,\mathrm{id}_{T_0}$, for $n \in \mathbb{N}^*$. As for this last point, there is often (let us fix Π_0) a "best choice", from which all the others are deduced by composition with $n\,\mathrm{id}_{T_0}$.

We see ((21) page 747′)[i4] that this [d10] homomorphism is quasi-unipotent, and that it therefore defines a homomorphism of [d11] group schemes 209

[p. 753]

$$(43) \qquad \underline{k}_i : \underset{(\simeq G_{a\mathbb{Q}} \otimes_{\mathbb{Z}} T_0)}{\underline{T}_{0\mathbb{Q}}} \longrightarrow \underline{\Pi}_{\mathbb{Q}}$$

(not just a germ!) which defines, by [d1] passage to the $\mathbb{Q}$-rational points, the germ of the homomorphism (42). We thus find a finite set (indexed by the set[i1] of germs of loop subgroups of Π_0, or of Π which amounts to the same) of outer homomorphisms (43) of group schemes. I feel like calling the Lie appro-[d2]ximation[i2] nondegenerate if the preceding homomorphisms are all nontrivial, hence are monomorphisms.

$$(44) \qquad \underline{k}_i : \underline{T}_{0\mathbb{Q}} \simeq G_{a\mathbb{Q}} \otimes_{\mathbb{Z}} T_0 \hookrightarrow \underline{\Pi}_{\mathbb{Q}}.$$

Suppose that $\underline{M}_{\mathbb{Q}}$ comes from a group scheme (affine and of finite type) $\underline{M}$ over $\mathbb{Z}$, such that we have

$$(45) \qquad M \longrightarrow \underline{M}(\widehat{\mathbb{Z}})$$

(it seems to me that one can always find such an $\underline{M}$...). We then denote by 210

[scan 213]

[p. 754] It would be interesting to bring out a theorem of existence, (or even[i1] of uniqueness, under still stronger conditions) of a "model" $\underline{M}$ smooth[i2] over $\mathbb{Z}$ of $\underline{M}_{\mathbb{Q}}$, satisfying the preceding conditions

7

$$(M \longrightarrow \underline{M}(\mathbb{Z}), \quad \text{and } \underline{M} \xrightarrow{\chi_{\underline{M}}} G_{m\mathbb{Z}}).$$

Here it will no longer be true in general, I presume, that the outer homomorphisms $\underline{k}_i$ [i3] (43) extend as they stand to homomorphisms $\underline{T}_i \underset{\text{df}}{=} \underline{T}_{i\mathbb{Z}} \longrightarrow \underline{\Pi}$. But I am going to|have one consider the centralizer of $k_i : T_0 \longrightarrow \Pi_0$ in Π_0, i.e. $\widetilde{L}_{i,0}$ which is a metabelian group: $\mathrm{Im}(T_0 \xrightarrow{k_i} \Pi_0)$ is a normal[i4] subgroup of finite index in it. Consider the homomorphism

$$\begin{array}{ccc} \widetilde{L}_{i,0} & \longrightarrow & \underline{\Pi}(\mathbb{Z}), \\ \| & & \\ \mathrm{Centr}_{\Pi_0}(k_i : T_0 \longrightarrow \Pi_0) & & \end{array} \tag{50}$$

which is entirely unipotent — it therefore factors through a homomorphism of group schemes

$$\mathrm{Env}(\widetilde{L}_{i,0}) \longrightarrow \underline{\Pi} \tag{51}$$

(cf. § 50, 4°, page 658′ ff), factoring 212

[scan 214]

through one of the smooth quotient|quotients group schemes[i1] $\underline{Z}_{i,n}$ [i2] of $\mathrm{Env}(\widetilde{L}_{i,0})$, of which the latter is the $\varprojlim$:

$$\begin{array}{ccccccccc} 1 & \longrightarrow & \underline{nT_0} & \longrightarrow & \underline{Z}_{i,n} & \longrightarrow & (H_{i,n})_{S_0} & \longrightarrow & 1 \\ & & & & & & \wr\| & & \\ & & & & & & (\widetilde{L}_{i,0}/nT_0) & & \end{array} \tag{52}$$

But of course, the restriction of the homomorphism obtained $S_0 = \mathrm{Spec}\,\mathbb{Z}$

$$(5|(s \qquad \underline{Z}_{i,n} \longrightarrow \underline{\Pi}$$

to

$$\underline{Z}^{\circ}_{i,n} \simeq \underline{nT_0}$$

is not in general a monomorphism — if it is for fixed n, then if $n \mid n'$, $n \neq n'$, it no longer is for n'. A particularly favorable case would be one where one can find n such that the induced homomorphism

$$\underline{nT_0} \longrightarrow \underline{\Pi} \tag{53}$$

is a monomorphism. This implies that the schematic closure in $\underline{\Pi}$ of the "1-parameter additive subgroup" $\underline{L}_{i\mathbb{Q}} = \underline{k}_i(\underline{T_0})$ is a smooth subgroup scheme of $\underline{\Pi}$. this n is then unique. 213

[p. 755]

This condition should also be sufficient – at least if one requires that this schematic closure have an identity component which is $= \mid \simeq$ isomorphic to G_{aS_0}. We then find, in any case,[i1] a unique monomorphism (up to conjugation)

$$(54) \qquad \underline{\underline{k'_i}} : \quad \underline{T_0} \hookrightarrow \underline{\Pi}$$

such that $\underline{\underline{k'_i}}_{\mathbb{Q}}$ is of the form $\underline{k_i}_{\mathbb{Q}} \circ (r_i \mathrm{id})$, [d2]with[i2] a suitable $\| \mid$!! $r_i \in \mathbb{Q}^{*+}$. I am not sure that under these conditions, [d3] the [i3]homomorphism deduced from $\underline{k'_i}$ by passing to the $\mathbb{Z}$-points

$$T_0 \simeq \underline{T_0}(\mathbb{Z}) \longrightarrow \underline{\Pi}(\mathbb{Z})$$

factors into a homomorphism

$$(55) \qquad T_0 \xrightarrow{k'_i \varphi \mid ?} \Pi_0 \xrightarrow{\text{can}} \underline{\Pi}(\mathbb{Z}) \ ,$$

where $T_0 \longrightarrow \Pi_0$ belongs to the "germ" $\underline{k_i}$, —

I will nevertheless take it as an additional[i4] hypothesis, when the $\underline{k'_i}$ exist.

I feel like stating a few other "good hypotheses", which we will try to realize 214

[p. 756]

this group scheme $\underline{\Pi}^\circ$ over $S_0 = \operatorname{Spec}\mathbb{Z}$, as an étale sheaf on the "big étale topos" of S_0, is generated by [d1]a finite number of[i1] subgroups $k_i'(\underline{\mathrm{G}_a})$, [d2] (with possible repetition of the same conjugacy class), or again [d3]that[i3] $\underline{\Pi}$ is[i2] [d4] generated by the[i4] the $k_i'(\mathrm{G}_a)$ (their various conjugates|one of each say) and the discrete group $(\Pi_0)_{S_0}$. (And there arises the interesting

question of making the relations explicit… is it enough to write the relations of Π_0, plus the commutativity of

$$(57) \qquad \begin{array}{ccc} T_0 & \xrightarrow{k_i'} & \Pi_0 \\ \downarrow{\scriptstyle \mathrm{can}} & & \downarrow{\scriptstyle \mathrm{can}} \quad ? \quad) \\ \underline{T_0} & \xrightarrow{\underline{k_i'}} & \underline{\Pi} \end{array}$$

Other conditions, concerning the group schemes

$$(58) \qquad \underline{\gamma}_{\underline{\Pi}} = \underline{\Pi}/\underline{\Pi}^\circ, \quad \underline{\gamma}_{\underline{\mathcal{G}}} = \underline{\mathcal{G}}/\underline{\mathcal{G}}^\circ, \quad \underline{\gamma}_{\underline{M}} = \underline{M}/\underline{M}^\circ$$

– we would like these to be constant group schemes, corresponding to the [d5] finite discrete groups which describe the corresponding quotients of the groups over $\mathbb{Q}$, which discrete groups are quotients 216

[scan 220]

Remark In the preceding presentation, the group Π_0 (or Π)[i1] itself seems to recede into the background, in favor of $\mathcal{G}_0$ (or $\mathcal{G}$)[i2] and its LT-structure. It seems to me indeed that the importance of the role of Π_0 fades behind that of the sub-[i3]group [d1] of finite index Π'_0 (if one exists) which would be [d2] a group with loops and of which[i4] the $k'_i(T_0)$ [d3] would be [d4] exactly the loop subgroups. It is not too[i5] clear, even if such a Π'_0 exists, that it is necessaril[y] unique (let us take|think of the case for example where $I = \emptyset$!). The case which had occupied me until now, $\Pi_0 = \mathcal{G}_0 = \mathcal{G}^+_{0,3} = |\text{–}\mathcal{G}^+_{1,1}|\mathcal{T}^+_{1,1}$, has been a little "misleading", for we then took $\Pi_0 := \mathcal{G}_0$ [d5] precisely. If we had thought [d6] in desire[i6] right at the beginning of my work, where by taking only[i7] $\Pi_0 = \Pi_{0,3}$ as the starting group, we would have seen (as was moreover actually the case) the role of $\Pi_{0,3}$ dwindle in favor of the smaller subgroups (type $\Pi^{\sharp}$, giving rise to the $\mathcal{G}^{\leftrightarrow}$ of § 49 VI…) 219

[p. 758] 4°) Lie [d1]approximation[i1] of $(\Pi_0, \mathcal{G}_0, M)$[i2] induced by an approximation of $\mathcal{G}_0$.

Let us start with a system $(\mathcal{G}_0 \supset \Pi_0)$ of a discrete[i3] LT-group $\mathcal{G}_0$, and of an invariant L-[i4]subgroup Π_0 of $\mathcal{G}_0$. Suppose given group scheme $\underline{\mathcal{G}}_{\mathbb{Q}}$ over $\mathbb{Q}$, and a homomorphism [m1655]

Marginal note. [m1655] We assume that the homomorphism $\mathcal{G}_0 \longrightarrow \mathbb{Z}^* = \{\pm 1\}$ defined by the action of $\mathcal{G}_0$ on the L-group Π_0 (multipliers) is trivial…

$$(65) \quad \varphi : \mathcal{G}_0 \longrightarrow \underline{\mathcal{G}}(\mathbb{Q})$$

having the property that for $\forall$ homomorphism

$$(66) \quad k_i : T_0 \longrightarrow \mathcal{G}_0$$

which is part of the LT-structure, the composite homomorphism

$$T_0 \longrightarrow \mathcal{G}_0 \longrightarrow \underline{\mathcal{G}}(\mathbb{Q})$$

is quasi-unipotent. We assume moreover that $\underline{\mathcal{G}}_{\mathbb{Q}}$ is generated by the set of [d2] $\mathbb{Q}$-rational points defined by the elements of $\mathcal{G}_0$ via (65).

We consider $\underline{\mathcal{G}}_{\mathbb{Q}}$ as equipped with the homomorphism (65) and with the family of outer homomorphisms

$$(67)\quad \underline{k}_i : \underline{T_0}_{\mathbb{Q}} \longrightarrow \underline{\mathcal{G}}_{\mathbb{Q}}$$

2°) The groups $\mathrm{GL}(2,\mathbb{R})^{\pm 1\sim}|$and [d1]. We set[i1]

$$\mathrm{GL}(2,\mathbb{R})^{\pm 1} = \{u \in \mathrm{GL}(2,\mathbb{R}) \mid \det u \in \{\pm 1\}\}. \tag{8}$$

This group operates differentiably on $\mathbb{C} \simeq \mathbb{R}^2$ leaving the origin fixed, we can therefore apply the construction of 1°), Here $\mathbb{S}_0$ is identified with the unit circle

$$\begin{array}{ccc} \mathbb{U} \overset{\text{déf}}{=} \{z \in \mathbb{C} \mid |z| = 1\} & \longrightarrow & \mathbb{S}_0^{\dagger|*} \\ z & \longmapsto & \mathbb{R}^+ z \end{array} \tag{9}$$

and for $u \in \mathrm{GL}(2,\mathbb{R})^{\pm 1}$, its action on $\mathbb{S}_0^{\dagger|*}$ is identified with the action on $\mathbb{U}$ given by

$$\begin{array}{ccc} z & \longmapsto & \dfrac{u(z)}{|z|} \\ \cup & & \\ \mathbb{U} & & \end{array} \quad . \tag{10}$$

A lifting of this action $u_{\mathbb{S}_0^{\dagger|*}}$[i2] to an action on $\tilde{\mathbb{S}}_0^{\dagger|*}$ amounts to a lifting of $u(e_0 = 1)$ to an element of $\tilde{\mathbb{S}}_0$. [d6] We [d7] shall construct|construct $\tilde{\mathbb{S}}$ [d8i3] by choosing a base point e_0 of $\mathbb{S}_0$, corresponding to the 227

[scan 230]

Proof Since the inclusion

$$\mathbb{U} \hookrightarrow \mathrm{Sl}(2,\mathbb{R}) \tag{15}$$

is a homotopy equivalence, [d1] is identified topologically[i1] with the inclusion $\mathbb{U} \longrightarrow \mathbb{U} \times \mathbb{R}^2$, we are reduced to proving that [d2] the inverse image $\mathbb{U}^{\sim}$[i2] of $\mathbb{U}$ in $\mathrm{Sl}(2,\mathbb{R})^{\sim}$ is identified with the universal covering $\mathbb{R}$ of $\mathbb{U}$ (pointed over 1 by 0 ...) Now if $u \in \mathbb{U}$, the [d4] choice of a $\tilde{u}$ over u, i.e. of a lifting of $\dfrac{u(1)}{|u(1)|}$ to $\mathbb{R}$ by formula (12), is identified (since $\dfrac{u(1)}{|u(1)|} = u(1) = u$) with the choice of a $t \in \mathbb{R}$ such that $\exp 2i\pi t \in u$, O.K.

Corollary 1 The inverse subgroup in $\mathrm{Sl}(2,\mathbb{R})^{\sim}$ of a finite cyclic subgroup of order n[i3] is $\simeq \mathbb{Z}$ ($\exists!$ generator $\overline{\omega}$ of it, such that we have $\overline{\omega}^n = \omega_0'$, where ω_0' is the [d5] generator of the $\mathrm{Ker}(\mathrm{Sl}(2,\mathbb{R})^{\sim} \to \mathrm{Sl}(2,\mathbb{R}))$.

m1668

Marginal note. [m1668] Applying this to the center $\{\pm 1\}$ of $\mathrm{Sl}(2,\mathbb{R})$, we find a canonical element $\omega_0 \in \mathrm{Sl}(2,\mathbb{R})^{\sim}$ with $\omega_0^2 = \omega_0'$.

Corollary 2 The action of a $g \in \mathrm{Gl}(2,\mathbb{R})^{-1}$ on ω_0' (or on the center $\omega_0^{\mathbb{Z}}$ of $\mathrm{Sl}(2,\mathbb{R})^{\sim}$) is via $\omega_0' \mapsto \omega_0'^{-1}$ (resp. $\omega_0 \mapsto \omega_0^{-1}$) ... 229

[scan 231]

[p. 763]

3°) The group $\mathrm{Gl}(2,\mathbb{Z})^{\sim}$.

Let $\mathrm{Gl}(2,\mathbb{Z})^{\sim}$ be the inverse image of $\mathrm{Gl}(2,\mathbb{Z})$ in $\mathrm{Gl}(2,\mathbb{R})^{\pm 1\,\sim}$, so that we have an extension structure

$$\begin{array}{ccccccccc} 1 & \to & \mathbb{Z} & \to & \mathrm{Gl}(2,\mathbb{Z})^{\sim} & \to & \mathrm{Gl}(2,\mathbb{Z}) & \to & 1. \\ & & \uparrow & \longmapsto & & & & & \\ & & n & \longmapsto & \omega_0^n | \omega_0'^{\,n} & & & & \end{array} \tag{16}$$

I would like to describe $\mathrm{Gl}(2,\mathbb{Z})^{\sim}$ by generators and relations. For this, I note this:

> Proposition The inverse image in $\mathrm{Gl}(2,\mathbb{Z})^{\sim \mathrm{i1}}$ of the cyclic subgroups $L_\rho \simeq \mathbb{Z}/6\mathbb{Z}$ and $L_\sigma \simeq \mathbb{Z}/4\mathbb{Z}$ generated by ρ and σ are isomorphic to $\mathbb{Z}$.

This follows from the

Corollary (to the proposition p. 762): For every finite cyclic subgroup $\mathfrak{Z}|\mathfrak{z} \subset \mathrm{Sl}(2,\mathbb{R})$, the inverse image of $\mathfrak{Z}|\mathfrak{z}$ in $\mathrm{Sl}(2,\mathbb{R})^{\sim}$ is isomorphic to $\mathbb{Z}$.

Indeed, by conjugation we may assume that $\mathfrak{Z}|\mathfrak{z} \subset \mathbb{U}$, i.e. $\mathfrak{Z}|\mathfrak{z} = \mu_n(\mathbb{C})$, but then $\tilde{\mathfrak{Z}}|\tilde{\mathfrak{z}}$ is identified with the set of $t \in \mathbb{R}$ with $(\exp 2i\pi t)^n = 1$ i.e. $\exp 2i\pi(nt) = 1$ i.e. 230

[scan 232]

$$t \in \frac{1}{n}\mathbb{Z},$$

the group of these t is $\simeq \mathbb{Z}$, q.e.d.

Corollary There exist $\tilde{\rho} \in \mathrm{Sl}(2,\mathbb{Z})^{\sim}$ and $\tilde{\sigma} \in \mathrm{Sl}(2,\mathbb{Z})^{\sim}$, over ρ and σ respectively, such that we have

$$\tilde{\rho}^3 = \tilde{\sigma}^{-2} \tag{17}$$

m1671

Marginal note. m1671 for a more pleasant statement, see (20) below ...

The set of these systems $(\tilde\rho, \tilde\sigma)$ is a torsor under $\mathbb{Z}$, by the operation

$$(\tilde\rho, \tilde\sigma) \longmapsto (\tilde\rho\,{\omega'_0}^{2n}, \tilde\sigma\,{\omega'_0}^{3n}), \tag{18}$$

where ω'_0 is the canonical generator of $\mathrm{Sl}(2,\mathbb{Z})^\sim \longrightarrow \mathrm{Sl}(2,\mathbb{Z})$.

We can also say that the inverse image of the element of the center $\{\pm 1\}$[i1] of $\mathrm{Sl}(2,\mathbb{Z})$ [d2] [d3] [d4] is a group isomorphic to $\mathbb{Z}$, with a[i2] unique generator ω_0 satisfying [d5]

$$\omega_0^2 = \omega'_0 \quad \begin{array}{l}(\text{the canonical generator of}\\ \mathrm{Sl}(2,\mathbb{Z})^\sim \longrightarrow \mathrm{Sl}(2,\mathbb{Z})\ )\end{array} \tag{19}$$

m1672

Marginal note. [m1672] it is better to say: ∃! generator $\tilde\rho$ (resp. $\tilde\sigma$)[i4] of the inverse image $\widetilde{L}_\rho | L_\rho$ of L_ρ (resp. L_σ) in $\mathrm{Sl}(2,\mathbb{Z})^\sim$, over ρ (resp. σ), and we then have relations (20)

and this being so, it is possible to lift ρ to $\tilde\rho$, σ to $\tilde\sigma$[i5] satisfying

$$\tilde\rho^{\,3} = \omega_0^{-1}, \qquad \tilde\sigma^{\,2} = \omega_0 \tag{20}$$

And this time, $\tilde\rho$ and $\tilde\sigma$ are uniquely deter-

[scan 233]

[p. 764]

mined. This follows [d1] [d2i1] at once from the preceding proposition.

i) Let us consider the inverse image of $\{1, \tau\} \subset \mathrm{Gl}(2, \mathbb{Z})$ in $\mathrm{Gl}(2, \mathbb{Z})^{\sim}$, [d3] extension of $\{1, \tau\} \simeq \mathbb{Z}/2\mathbb{Z}$ by $\mathbb{Z}$ — I say that this extension is split.

m1675

Marginal note. [m1675] N.B. $\tau = \tau_\infty = \begin{pmatrix} -1 & 0 \\ 0 & 1 \end{pmatrix}$ i.e. $\tau(x+iy) = -x+iy$ (reflection with respect to the y-axis)

Indeed, the action of τ on $\mathbb{S}_0$ lifts to the action of $\tilde{\tau}$ [d4] of order 2 on $\tilde{\mathbb{S}}_0 \simeq \mathbb{R}$, which is given by

$$\tilde{\tau} t = \frac{1}{2} - t \tag{21}$$

for we have for $z \in \mathbb{U}$, $z = \exp 2i\pi t$

$$\begin{aligned} \tau z = -\overline{z} = -\exp 2i\pi t = \exp(\pi i t - 2i\pi t) \\ = \exp\{\, 2i\pi \underbrace{\left(\frac{1}{2} - t\right)}_{\tilde{\tau}(t)} . \end{aligned} \tag{22}$$

[d6] It is perhaps more convenient to work with $\tau' = \tau'_\infty = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}$, which [d7] exchanges $e_0 = 1$ and $e_1 = i$, i.e. the reflection with respect|by to the main diagonal. This automorphism stabilizes $\mathbb{U}$, and fixes the point $\exp \dfrac{\pi i}{4|8} = \dfrac{\sqrt{2}}{2}(i+1))$, it lifts to

$$\widetilde{\tau'}(t) = 2i\pi \left(\frac{1}{8|4} - t\right). \tag{23}$$

Let us note that [d8] the action of $\widetilde{\tau'}$ (like that 232

$$(29)\qquad \begin{cases} r_\infty = \tau_\infty = \begin{pmatrix} -1 & 0 \\ 0 & 1 \end{pmatrix} \\ r_0 = \tau'_\infty = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \\ r_1 = -\tau'_0 = \begin{pmatrix} -1 & 1 \\ 0 & 1 \end{pmatrix} \end{cases}$$

m1679

Marginal note. m1679 (30) $\begin{cases} r_0(\rho)=\rho^{-1}, \quad r_0(\sigma)=\sigma^{-1} \\ r_1=\rho^{-1}r_0=r_0\rho \\ r_\infty=\sigma r_0=r_0\sigma^{-1} \end{cases}$

Note that $(\tilde\rho,\tilde\tau')$ generate a group isomorphic to D_∞, which I denote by $D_{\tilde\rho}$, likewise $(\tilde\sigma,\tilde\tau')$ generates|generate a group $D_{\tilde\sigma}$, isomorphic to D_∞. Finally $(\omega_0,\tilde\tau')$ generate a group D_{ω_0}, again isomorphic to D_∞. We have a diagram

(31)

$\begin{cases} i(\omega_0)=\tilde\rho^{-3} \\ i(\tilde\tau')=\tilde\tau' \end{cases}$ $\begin{cases} j(\omega_0)=\tilde\sigma^2 \\ j(\tilde\tau')=\tilde\tau' \end{cases}$

and corollary 1 is written in the form

(32) $\mathrm{Gl}(2,\mathbb{Z})^\sim \simeq D_{\tilde\rho} *_{D_{\omega_0}} D_{\tilde\sigma}$

(amalgamated sum of groups).

Now we can take in $D_{\tilde\rho}, D_{\tilde\sigma}$ the involutive generators

(33) $\begin{cases} \tilde r_0=\tilde\tau'=\tilde\tau'_\infty & \text{and} \quad \tilde r_1 \overset{\text{dfn}}{=} \tilde\rho^{-1}\tilde r_0=\tilde r_0\tilde\rho \quad \text{in } D_{\tilde\rho} \\ \tilde r_0=\cdots\cdots & \text{and} \quad \tilde r_\infty \overset{\text{dfn}}{=} \tilde\sigma\,\tilde r_0=\tilde r_0\tilde\sigma^{-1} \end{cases}$

235

[scan 237]

[p. 766]

and we then find

Corollary 2 $\mathrm{Gl}(2,\mathbb{Z})^\sim$ admits a presentation (with three involutive generators $\tilde r_0,\tilde r_1,\tilde r_\infty$):

(34) $\boxed{\tilde r_0^2=\tilde r_1^2=\tilde r_\infty^2=1, \quad \Big(\underbrace{\tilde r_0\tilde r_1}_{\tilde\rho}\Big)^3\cdot\Big(\underbrace{\tilde r_\infty\tilde r_0}_{\tilde\sigma}\Big)^2=1}$

4°) The isomorphism $\mathrm{Gl}(2,\mathbb{Z})^\sim \simeq S\mathcal{T}_{1,1}$ ✓

Put

(35) $X_1=\mathbb{R}^2/\mathbb{Z}^2\simeq(\mathbb{R}/\mathbb{Z})^2\simeq\mathbb{U}\times\mathbb{U}.$

(model surface of genus 1), write its composition law additively, and let

$$(36)\quad a_{1,0} = 0 \in X_1, \quad X_1 \setminus \{a_{1,0}\} = X_1 \setminus \{0\} = U_{1,1},$$

model surface of type $(g, \nu) = (1, 1)$.

The group $\mathrm{Gl}(2, \mathbb{Z})$ is identified with the group of automorphisms of the topological group X_1, and thus operates on X_1 leaving fixed the origin 0, hence it operates on $U_{1,0}$, whence a homomorphism

$$(37)\quad \mathrm{Gl}(2, \mathbb{Z}) \xrightarrow{\sim} \mathcal{T}_{1,1} = \mathcal{T}(U_{1,1})$$

group of isotopy classes of homeomorphisms of $U_{1,1}$,

which we know to be an isomorphism. Moreover, $G = \mathrm{Gl}(2, \mathbb{Z})$ operates differentiably|differentially on X_1, and the action on the tangent space is identified with the tautological action of $\mathrm{Gl}(2, \mathbb{Z}) \subset \mathrm{Gl}(2, \mathbb{R})$ on $\mathbb{R}^2$. Thus the group denoted by $\widetilde{G}$ in 237

[p. 767]

1°) e is canonically isomorphic, as an extension of G by $T_0 = \mathbb{Z}$ (N.B. $\mathbb{R}^2$ and its quotient X_1 are canonically oriented) to the group $\mathrm{Gl}(2, \mathbb{Z})^\sim$ of 3°.

Thus we find [d1] (cf. proposition p. 761)[i1] the

Theorem The inverse image under the isomorphism (37) of the extension $S\mathcal{T}_{1,1}$ of $\mathcal{T}_{1,1}$ by $\mathbb{Z}$ is canonically identified with $\mathrm{Gl}(2, \mathbb{Z})^\sim$, so it admits the two[i2] explicit presentations of 3°

$$\text{a)}\quad \tilde{\rho}^3 \cdot \tilde{\sigma}^2 = 1, \quad \tilde{\tau}'(\tilde{\rho}) = \tilde{\rho}^{-1}, \quad \tilde{\tau}'(\tilde{\sigma}) = \tilde{\sigma}^{-1}, \quad \tilde{\tau}'^2 = 1$$

$$\text{b)}\quad \tilde{r}_0^2 = \tilde{r}_1^2 = \tilde{r}_\infty^2 = 1, \quad (\tilde{r}_0\tilde{r}_1)^3 \cdot (\tilde{r}_\infty\tilde{r}_0)^2 = 1.$$

Let us now interpret $\mathcal{T}_{1,1}$ and $S\mathcal{T}_{1,1}$ in terms of the fundamental group of $U_{1,1}$, which we shall compute by choosing (judiciously ?) a base point $a_{1,1}$ in $U_{1,1}$,

$$(38)\quad \Pi_{1,1} \overset{\text{dfn}}{=} \pi_1(U_{1,1}, a_{1,1}),$$

$$(39)\quad \mathcal{T}_{1,1} \simeq \mathrm{Aut}\,\mathrm{ext}_{\mathrm{lac}}(\Pi_{1,1})$$

[scan 240]
m1685

Marginal note. m1685 I use the notation ℓ'_0 instead of ℓ_0, since ℓ_0 already denotes a well-determined element of $\mathrm{Gl}(2,\mathbb{Z})$!

We have a presentation of $\Pi_{1,1}$ by

$$\Pi_{1,1} = \{x, y, \ell'_0 \mid [x,y]\ell'_0 = 1\} \tag{40}$$

and denoting by L the subgroup-loops[i1] of $\Pi_{1,1}$ generated by ℓ'_0, we shall have

$$S\mathcal{T}_{1,1} \simeq \mathrm{Norm}_{\mathrm{Aut}_{\mathrm{lac}}(\Pi_{1,1})}(L). \tag{41}$$

Thus we should make explicit the action [d1]

$$S\mathcal{T}_{1,1} \simeq \mathrm{Gl}(2,\mathbb{Z})^{\sim} \longrightarrow \mathrm{Aut}_{\mathrm{lac}}(\Pi_{1,1}),$$

by the action of the generators $\tilde{\rho}, \tilde{\sigma}, \tilde{\tau}'$ or $\tilde{r}_0 = \tilde{\tau}', \tilde{r}_1, \tilde{r}_\infty$ — action which must normalize L, and more precisely, transform ℓ'_0 into ℓ'_0 (for $\tilde{\rho}, \tilde{\sigma}$) or into ℓ'^{-1}_0 (for $\tilde{\tau}' = \tilde{r}_0, \tilde{r}_1, \tilde{r}_\infty$). Thus we must make explicit the action of the generators on x and on y. (N.B. $\Pi_{1,1}$ is the free group having as generators x and y !)

Let us consider the principal covering $U'^{a}_{1,1}$ with group $\mathbb{Z}^2$ of $U_{1,1} = X_1 - \{0\}$, induced by the principal covering $\mathbb{R}^2$ of $X_1 = \mathbb{R}^2/\mathbb{Z}^2$, — the inverse image of $U_{1,1}$ is $\mathbb{R}^2 \setminus \mathbb{Z}^2$. Let us choose a base point [d2]

[p. 768]
d1

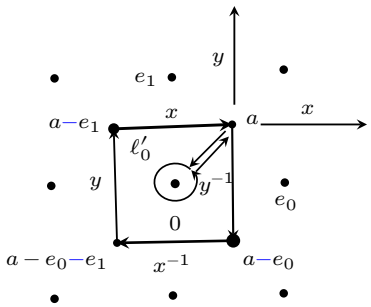
$$a \in \mathbb{R}^2 \setminus \mathbb{Z}^2,$$

up above $a_{1,1}$, we will thus have a canonical isomorphism

$$\Pi_{1,1} \simeq \pi_1(\mathbb{R}^2 \setminus \mathbb{Z}^2, \mathbb{Z}^2; a) \tag{42}$$

whence an exact sequence

$$1 \to \pi_1(\mathbb{R}^2 \setminus \mathbb{Z}^2) \longrightarrow \underset{\pi_1(U_{1,1} = X_1 \setminus \{a_{1,0}\})}{\Pi_{1,1}} \longrightarrow \underset{\substack{\pi_1(X_1) \\ \wr \\ (\Pi_{1,1})_{\mathrm{ab}}}}{\mathbb{Z}^2} \to 1. \tag{43}$$



The elements of the mixed π_1 are made explicit by Jean Malgoire's calculation using the pairs

$$(\gamma, \ell) \qquad \begin{pmatrix} \gamma \in \mathbb{Z}^2, \quad \ell \text{ class of paths in} \\ \mathbb{R}^2 \setminus \mathbb{Z}^2 \text{ from } a \text{ to } a + \gamma \end{pmatrix} \tag{44}$$

which we "compose like functions".

We will take, over the generators[i1 d3] e_0, e_1 of $\mathbb{Z}^2$, the elements x, y defined by the straight-line paths from a to $a + e_0$, resp. $a + e_1$, starting from the origin

$$a = \tilde{a}_{1,1} = \left(+\frac{1}{2}, +\frac{1}{2}\right) \tag{45}$$

Then the element $xyx^{-1}y^{-1}$ is represented by the path above, which is visibly opposite to the positively oriented "straight-line" loop from a around the origin 0. 240

5°) Digression on the coverings of[i1] germs of spaces. A) Coverings of germs
m1689

Marginal note. m1689 here we exclude d1 not the[i2] improper filter ($\emptyset \in \Phi$) corresponding to the empty germ of spaces

A "germ of spaces" is defined by a topological space S and a d2 filter Φ on S, a morphism from (S, Φ) to (S', Φ') is an element of

$$(46) \qquad \varinjlim_{S_i \in \Phi} \mathrm{Hom}_{\Phi_{S_i|S'_i}, \Phi'}(S_i, S'),$$

where d3 for $S_i \in \Phi$, Φ_{S_i} is the filter induced by Φ on S_i, and $\mathrm{Hom}_{\Phi_{S_i}, \Phi'}$ denotes the set of continuous maps f[i3] from S_i to S' compatible with Φ_{S_i}, Φ', i.e. such that $\forall S'_j \in \Phi'$, d4 we have $f^{-1}(S'_j) \in \Phi_{S_i}$. The composition of morphisms of germs is obvious.

A covering (étale) of a germ (S, Φ) of topological spaces is an object of the category

$$(47) \qquad \mathrm{Rev}(S, \Phi) = \varinjlim_{S_i \in \Phi} \mathrm{Rev}(S_i); \qquad *$$

these|the coverings form a category, which we could probably[i4] interpret (at least in "good cases")[i5] as the category of coverings of a suitable topos (namely the projective limit topos 241

[p. 769]

m1691

Marginal note. m1691 this has been done by Olivier Leroy?

of the (small)[i1] étale topoi of the $S_i \in \Phi$).

This category, "in the good cases", tends to be multi-Galois, or even Galois.

We say that a germ [d1] of spaces is 1-connected, or simply connected, if the natural functor

$$(48) \qquad \begin{array}{ccc} (\mathrm{Ens}) & \longrightarrow & \underline{\mathrm{Rev}}(S,\Phi) \\ E & \longmapsto & {}^{1}E_{(S,\Phi)}|\widetilde{E}_{(S,\Phi)}, \text{ constant covering with value } E|\Phi \end{array}$$

is an equivalence of categories. This means that

1°) This functor is fully faithful (we say that (S,Φ) is 0-connected), which means, if S is locally connected, that $\forall S_i \in \Phi$, $\exists S_j \in \Phi$, $S_j \subset S_i$, such that $S_j \neq \emptyset$ and[i2] $(\pi_0(S_j) \longrightarrow \pi_0(S_i))$ is a constant map

m1692

Marginal note. m1692 thus this implies that this germ of spaces is nonempty

2°) the functor is moreover essentially!|essentially^{t} surjective, which means that for every $S_i \in \Phi$, $\exists S_j \in \Phi$, $S_j \subset S_i$[i3] such that for every connected component $S_{j,\alpha}$ of S_j, the outer homomorphism $\pi_1(S_{j,\alpha}) \longrightarrow \pi_1(S_i)$ is trivial.

Coverings of germs of spaces form a fibered category over that 242

[scan 244]

of germs of spaces. The category of topological spaces [d1] can be regarded as a full subcategory of that of germs of topological spaces by associating to every space S, the germ (S, Φ), where Φ is the trivial filter on S. This being so, the fibered category of coverings of germs of spaces induces|induced that of coverings of topological spaces.

Let $\mathcal{X}$ be a germ of spaces such that $\underline{\mathrm{Rev}}\mathcal{X}$ is a multi-[i1]Galois category, [d3] and let $\mathcal{S}$ be a 1-connected germ of spaces, $\mathcal{S} \longrightarrow \mathcal{X}$ a morphism. Then we have

$$\underline{\mathrm{Rev}}(\mathcal{X}) \longrightarrow \underline{\mathrm{Rev}}(\mathcal{S}) \xleftarrow{\sim} (\mathrm{Ens}) \tag{49}$$

fiber functor on $\underline{\mathrm{Rev}}(\mathcal{X})$, which makes it possible to define

$$\pi_1(\mathcal{X}, \mathcal{S}) \tag{50}$$

as the π_1 relative to this fiber functor. If $\mathcal{X}$ is 0-connected so $\underline{\mathrm{Rev}}(\mathcal{X})$ is Galois, we will thus have, if $\Pi \simeq \pi_1(\mathcal{X}, \mathcal{S})$, an equivalence of categories 243

[scan 246]

. I am interested in the case where $x \in X$ has a neighborhood homeomorphic to $\mathbb{R}^2$ — i.e. X is a surface at x. I will denote by

$$(53) \qquad D^*_{X,x} \quad \text{or} \quad D^*_x$$

the residual germ of X at x (contained in the germ $D_{X,x}$ or D_x of X at x).

I am interested in the choice of a universal covering $D^{*\sim}_x$ of D^*_x — but for which|whom I have to make a digression on the abstract notion of universal covering of a germ of spaces.

Let (S, Φ) be a germ of spaces. A covering of (S, Φ) comes from a covering S'_i of an $S_i \in \Phi$, and defines a germ of spaces $(S'_i, \Phi_{S'_i})$, where $\Phi_{S'_i}$ denotes the inverse image of Φ_{S_i} in S'_i. This germ of spaces over $\mathcal{S} = (S, \Phi)^{i1}$ (up to unique isomorphism of germs) does not depend on the choice of S_i, S'_i, but only on the element of Rev$(\mathcal{S})$. We thus find a canonical functor 245

[scan 247]

[p. 771]

$$\text{(54)} \qquad \underline{\text{Rev}}(\mathcal{S}) \longrightarrow (\text{Germesp})/\mathcal{S}$$

which is fully faithful. A germ of spaces $\mathcal{S}'$ over $\mathcal{S}$ is called [d1] an étale covering of $\mathcal{S}$, if it is in the essential image. Thus the category $\underline{\text{Rev}}(\mathcal{S})$ of étale coverings of the germ of spaces $\mathcal{S}$ is equivalent to the full subcategory of the [d2] category of germs of spaces, over the germ $\mathcal{S}$, [d3] formed by the étale coverings of the said germ $\mathcal{S}$.

Let us assume [d4] always|always that the category $\underline{\text{Rev}}(\mathcal{S})$ is [d5] multi-Galois. The 1-connected objects are called universal coverings of $\mathcal{S}$ — [d6] they form a groupoid, connected iff $\underline{\text{Rev}}(\mathcal{S})$ is Galois i.e. iff the germ $\mathcal{S}$ is 0-connected. The universal coverings!|coverings of $\mathcal{S}$ can be interpreted as germs of spaces. Let $\tilde{\mathcal{S}}$ be such a universal covering, then $\tilde{\mathcal{S}}$ is indeed a 1-connected|1. connected germ of spaces, and $\tilde{\mathcal{S}} \longrightarrow \mathcal{S}$ makes it possible to define $\pi_1(\mathcal{S}, \tilde{\mathcal{S}})$. This being so, we have a canonical isomorphism

$$\text{(55)} \qquad \pi_1(\mathcal{S}, \tilde{\mathcal{S}}) \simeq \text{Aut}_{\underline{\text{Rev}}(\mathcal{S})}(\tilde{\mathcal{S}})$$

m1698

Marginal note. [m1698] Which expresses that $\pi_1(\mathcal{S}, \widetilde{\mathcal{S}})$ is none other than the π_1 of the "abstract" multi-[i1]Galois category $\underline{\text{Rev}}(\mathcal{S})$, "calculated" at the 1-connected element $\widetilde{\mathcal{S}}$.

[scan 248]
d1

B) Case of punctured surfaces

That said, let us return to the situation of (53), of a topological space X, and of an $x \in X$ such that X is a surface at x. Then the category [d2]

$$\underline{\mathrm{Rev}}(D_x^*)$$

is a Galois category, abelian,[i1] whose fundamental group is identified canonically with the orientation module $\overline{T}_x$ of X at x

$$(56) \qquad \pi_1(D_x^*) \overset{\mathrm{def}}{=} \pi_1(\underline{\mathrm{Rev}}(D_x^*)) \simeq \overline{T}_x.$$

This comes from the fact that the germ D_x^* [d3] admits a "basis"[i2] formed of spaces $D_{x,i}^*$ [d4] arising[i3] from the disks with center x, and the π_1 of the said disks form a constant projective system…

Thus the universal coverings $D_x^{*\sim}$ of D_x^* form a connected groupoid, with fundamental groupoid|group $\overline{T}_x$.

Let us therefore choose such a $D_x^{*\sim}$, and consider the composite morphisms

[scan 249]
[p. 772]

$$D_x^{*\sim} \longrightarrow D_x^* \hookrightarrow X - \{x\}$$

- more generally, let S be a subset of X, containing x as an isolated point (for example a discrete subset of X), so that we have

$$(57) \qquad D_x^* \hookrightarrow U \overset{\text{def}}{=} X \setminus S$$

and consider the composites

$$(58) \qquad D_x^{*\sim} \longrightarrow D_x^* \hookrightarrow U.$$

If $\underline{\mathrm{Rev}}(U)$ is multi-Galois (for example U locally[i1] 1|0-connected), then we can therefore consider the corresponding fundamental group of U

$$(59) \qquad \pi_1(U, D_x^{*\sim}),$$

I am going to define a canonical homomorphism

$$(60) \qquad K_x|\kappa_x : \overline{T}_x \longrightarrow \underbrace{\pi_1(U, D_x^{*\sim})}_{\begin{array}{c}\simeq \text{ Aut of the fiber}\\ \text{functor } \underline{\mathrm{Rev}}(U) \longrightarrow \underline{\mathrm{Rev}}(D_x^{*\sim})\\ \text{on } \underline{\mathrm{Rev}}(U)\end{array}},$$

we can describe it for example as

$$(61) \qquad \begin{array}{ccc} \pi_1(D_x^*, D_x^{*\sim}) & \longrightarrow & \pi_1(U, D_x^{*\sim}) \\ \wr & & \\ \overline{T}_x & & \end{array}$$

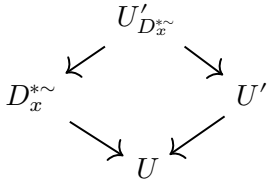
[scan 250]



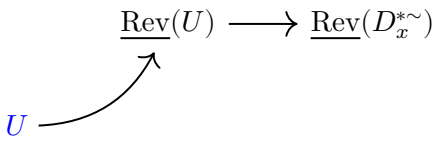
induced by the inclusion

$$D_x^* \hookrightarrow U$$

or again, [d1] in terms of automorphisms of a fiber functor, as the [d2]operation of $\overline{T}_x$ on

$$\Gamma(D_x^{*\sim}, \underbrace{U' \times_U D_x^{*\sim}}_{U'_{D_x^{*\sim}}})$$

coming from the operations of $\overline{T}_x$ on $D_x^{*\sim}$.



d4

Suppose that we have already chosen separately[i2] a fundamental group $\pi_1(U, \widetilde{U}) = \pi$[i3] of U, by the choice of a base point, or, more generally, of a universal covering $\widetilde{U}$ of U. To compare it with $\pi_1(U, D_x^{*\sim})$, we shall therefore choose a "path of domination" from $D_x^{*\sim}/U$ to|: $\widetilde{U}/U$, i.e. an isomorphism

$$(62) \qquad \widetilde{U} \xrightarrow{\sim} \mathrm{Revuni}(U, D_x^{*\sim})$$

(universal covering of U defined by the fiber functor

m1702

Marginal note. m1702 N.B. if d7 $D_x^{*\sim}$ defined by a universal covering $D_{x,i}^{*\sim}$ of a punctured disk $D_{x,i}^{*}$, and if $\tilde{y} \in D_{x,i}^{*\sim}$, $\tilde{z} \in \widetilde{U}$, y, z the images in U, then

$$\mathrm{Revuni}(U, D_x^{*\sim}) \simeq \mathrm{Revuni}(U, y)$$

and $\widetilde{U} = \mathrm{Revuni}(U, z)$: the choice of (62) is equivalent to that of a path from y to z (U locally 1-connected).

from x. In general, let $I = [0,1]$, and $[I]$ be the residual germ of I at 0. [d1] This is obviously a 1-connected germ.[i1]
m1704

Marginal note. [m1704] Rather than parametrize by germs of neighborhoods of 0 in $[0,1]$, it would be more convenient for what follows to define a germ of an arc of X issuing from x as a germ of a subset of X at x, satisfying certain properties….

If X is a topological space and $x \in X$, we call a germ of an arc of a curve [d2] X issuing from x, the morphisms

$$(66) \qquad [I] \xrightarrow{\gamma} \text{germ rés}_x(X) \overset{\text{def}}{=} D^*_x$$

from the germ $[I]$ into the residual germ $D^*_{X,x}$[i2] of X at x. Such a germ is therefore described by a continuous map from an interval $[0,\varepsilon]$ $(0 < \varepsilon \leq 1)$

$$(67) \qquad [0,\varepsilon] \xrightarrow{\varphi} X$$

such that we have

$$(68) \qquad \begin{cases} \varphi(0) = x \\ \varphi(t) \neq x \quad \text{if } t \in]0,\varepsilon] \end{cases} .$$

In the case we are interested in (X a surface in a neighborhood of x, hence $\underline{\text{Rev}}(D^*_x)$ [d4] Galois[i3] abelian with group $\overline{T}_x$), we can use this morphism to define a fiber functor on D^*_x

$$(69) \qquad \underline{\text{Rev}}(D^*_x) \longrightarrow \underline{\text{Rev}}([I]) \xleftarrow{\sim} (\text{Ens})$$

[p. 774]

hence a universal covering

$$D_x^{*\sim} \overset{\text{déf}}{=} \operatorname{Rev}\operatorname{uni}(D_x^*, ([I], \varphi)). \tag{70}$$

Of course, we shall have a factorization

$$[I] \longrightarrow D_x^{*\sim} \longrightarrow D_x^* \; (\hookrightarrow U), \qquad [I] \xrightarrow{\varphi} D_x^{*\sim}$$

so we have a canonical isomorphism

$$\operatorname{Rev}\operatorname{uni}(U, D_x^{*\sim}) \simeq \operatorname{Rev}\operatorname{uni}(U, [I]), \tag{71}$$

where I is regarded as a 1-connected germ over U by the composite morphism

$$[I] \longrightarrow D_x^* \longrightarrow U.$$

Thus we have

$$(72) \quad \pi_1(U, D_x^{*\sim}) = \pi_1(U, [I]) \xleftarrow{K_x} \overline{T}_x.$$

m1705

Marginal note. m1705 D) Relation with differential structure

When X is equipped with a differentiable structure in a neighborhood of x, we say that a germ of a curve in X issuing from x is differentiable, if the|the [d1]germ[i1] of a continuous map

$$I \longrightarrow X$$

which defines it is differentiable, [d2]and moreover[i2]

[scan 254]

the tangent map at the origin, [d1]

$$(73) \quad \mathbb{R} \longrightarrow \operatorname{Tang}_x(X),$$

is injective. Then the image of $\mathbb{R}^+$ is a homogeneous half-line in the tangent space to X at x, which we call the half-tangent of the germ of an arc of a curve under consideration at x.

Returning for a moment to the purely topological case, we are going to consider the set Germarc|Courarc(X, x) of germs of arcs of X issuing from x, as the set of objects of a groupoid (the local fundamental groupoid of X at x), taking as morphisms from γ to γ' [d2] the isomorphisms from [d3] $D^{*\sim}_{x,\gamma}$ to $D^{*\sim}_{x,\gamma'}$

$$\mathrm{Isom}(\gamma, \gamma') \overset{\text{déf}}{=} \mathrm{Isom}_{D^*_x}(D^{*\sim}_{x\gamma}, D^{*\sim}_{x,\gamma'}). \tag{74}$$

We thus find by construction[i1] an equivalence of [d4] connected groupoids

$$(75) \quad \text{Germarc|Courarc}(X, x) \longrightarrow \text{Rev uni}(D^*_x).$$

[p. 777] by composing this functor with the functor

$$\begin{array}{c}\text{category of 1-connected germs}\\ \text{of spaces over|over}\\ \text{the germ } D_x^*\end{array} \longrightarrow \underline{\text{Revuni}}(D_x^*). \tag{89}$$

In fact, (88) will associate|we associate to $\forall\ A \in \mathcal{A}_x$ a [d2] filter on $X - x$ tending to x, of which[i1] we will take the germ [d3].

[d4] The elements A[i3] of[i2] $\mathcal{A}_x$ are obviously identified with the cones [d5]closed C[i4] in $\mathrm{Tang}_x(X)$, [d6] distinct from $\{0\}$ and from the tangent[t]|tangent[i5] space $\forall$ entire. [d7] Let $C\mathcal{A}_x|C \in \mathcal{C}\mathcal{A}_x$ be one of these cones.[i6] Let us consider a local isomorphism [d8]

$$f : (\mathrm{Tang}_x(X), 0) \xrightarrow{\sim} (X, x), \tag{90}$$

[d10] whose map[i7] on tangent spaces is the identity. [d11] If C is a cone $\in \mathcal{C}\mathcal{A}_x$, its image under such an isomorphism depends on the choice of the local isomorphism in question. But let us consider the [d12] filter base[i8] [d13]of[i9] cones $C' \in \mathcal{C}\mathcal{A}_x$[i10] containing [d14] C strictly (i.e. corresponding to arcs A' which are neighborhoods of A, or again such that $C' - \{0\}$ is a neighborhood of $C \setminus \{0\}$), then the

[scan 261]

[p. 778] Let us now consider, once again, a differentiable arc γ in X issuing from x, and its half-tangent Δ. Then $\{\Delta\} \in \mathcal{A}_x$, and we can consider the germ of spaces $\{\Delta\}^\sim$ over D_x^*. We have the|some[i1] two canonical inclusion morphisms

$$\gamma \hookrightarrow \{\Delta\}^\sim \hookrightarrow D_x^* \tag{91}$$

and we deduce from this a canonical isomorphism

$$\begin{array}{ccc} \mathrm{Revuni}(D_x^*, \gamma) & \simeq & \mathrm{Revuni}(D_x^*, \{\Delta\}^\sim) \\ \| \text{déf} & & \| \text{déf} \\ D_{x,\gamma}^{*\sim} & & \Theta(\Delta) \end{array} \tag{92}$$

If γ' is another differentiable arc at x, corresponding to the half-tangent Δ', we thus have

$$D_{x,\gamma}^{*\sim} \simeq \Theta(\Delta), \qquad D_{x,\gamma'}^{*\sim} = \Theta(\Delta')$$

whence

$$\begin{array}{ccc} \mathrm{Isom}(D_{x,\gamma}^{*\sim}\}, D_{x,\gamma'}^{*\sim}) & \simeq & \mathrm{Isom}(\Theta(\Delta), \Theta(\Delta')) \\ \| \text{déf} & & \sim \uparrow \Theta \\ \mathrm{Isom}(\gamma, \gamma') & & \mathrm{Isom}_{\Pi_1(\mathbb{S}_x)}(\Delta, \Delta') \end{array}$$

which is the [d1] bijection (80) sought.

[d2] In summary, we have an essentially commutative diagram of equivalences of groupoids

(93)

m1708

Marginal note. m1708 Of course, the difficulty here came from the fact that we had no direct morphism between the germ D^*_x, and the space $\mathbb{S}_x$...

The only functor that has not yet made explicit is the functor

(94)

defined as the composite of Θ^{-1} with the canonical functor $\Pi_1(\mathbb{S}_x)\longrightarrow$ Rev.uni.$(\mathbb{S}_x)$.

Finally, in these considerations of differential topological geometry, the key construction is that of the functor Θ (81). We have taken some pains to define it in an invariant way. In the case where we have a local isomorphism

$$f:(\underbrace{\mathrm{Tang}_x(X)}_{V},0)\longrightarrow(X,x),\tag{90}$$

the construction of this|— Θ can be made explicit as a canonical construction in a vector space V. Every homogeneous half-line

[scan 263]

[p. 779]

Δ in V defines a germ of arcs (differentiable) in V issuing from 0, whence a corresponding universal covering $D^{*\sim}_{V,0;\Delta}$ of $D^*_{V,0}$, hence a universal covering $D^{*\sim}_{x,\Delta}$ of D^*_x. We must see how this $D^{*\sim}_{x,\Delta}$ depends "continuously" on Δ, and what amounts to the same thing, how the universal covering $V^{*\sim}_\Delta$ of $V^*=V\setminus\{0\}$ depends continuously on Δ, which is quite standard....

Now let $u|\varphi$[i1] be an an [d1]automorphism[i2] of X, fixing x, and differentiable at x. We thus have [d2] automorphisms induced [d3]

$$^{u|\varphi}D^*_x\quad\text{automorphism of } D^*_x,\qquad {}^{u|\varphi}\mathbb{S}_x\quad\text{automorphism of } \mathbb{S}_x.\tag{95|94}$$

Consider on the other hand a universal covering $\tilde{\mathbb{S}}_x$ of $\mathbb{S}_x$, and let $D^{*\sim}_x$ be an associated universal covering of D^*_x, thanks to the equivalence (94). I say that we then have a

Scans 267–280

[scan 267]

[p. 781]

mant|me by the commutativity of the diagrams

$$(107)\qquad \begin{array}{ccc} H(A) & \xrightarrow{\overset{i_A}{\sim}} & \\ {\scriptstyle (100)}\downarrow{\scriptstyle \sim} & & H(\mathbb{S}_x^{\sim}, \mathbb{D}_x^{*\sim}) \\ H(A') & \xrightarrow[i_{A'}]{\sim} & \end{array} .$$

To verify the fact that the functor $\underline{\mathrm{Gr}}(H)$ of (102) is essentially constant, I consider the two functors (independent of the choice of $\mathbb{S}_x^{\sim}, \mathbb{D}_x^{*\sim}$)

$$(108)\qquad \begin{cases} A \longmapsto \mathbb{S}_{xA}^{\sim}, & A \longmapsto \mathbb{D}_{x,A}^{*\sim} \\ \underline{\mathcal{A}}_x \to \underline{\mathrm{Revuni}}(\mathbb{S}_x) & \underline{\mathcal{A}}_x \to \underline{\mathrm{Revuni}}(\mathbb{D}_x^*) \end{cases} ,$$

which factor into equivalences

$$(109)\qquad \underline{\mathrm{Gr}}(\underline{\mathcal{A}}_x) \overset{F}{\underset{\approx}{\to}} \underline{\mathrm{Revuni}}(\mathbb{S}_x), \qquad \underline{\mathrm{Gr}}(\underline{\mathcal{A}}_x) \overset{G}{\underset{\approx}{\to}} \underline{\mathrm{Revuni}}(\mathbb{D}_x^*)$$

This said, using $\mathbb{S}_x^{\sim}, \mathbb{D}_x^{*\sim}$,[i1] we have for $A \in \mathrm{Ob}\,\underline{\mathcal{A}}_x = \mathcal{A}_x$ also, isomorphisms functorial in A

$$(110)\qquad \begin{cases} \mathbb{S}^{\sim}|H(A) \simeq \mathrm{Isom}_{\underline{\mathrm{Revuni}}(\mathbb{S}_x)}\left(\underbrace{F(A)}_{\| \ \mathbb{S}_{x,A}^{\sim}}, \mathbb{S}^{\sim} \right) \\ \mathbb{D}_x^{*\sim}(\mathrm{Ep}|E_p A) \simeq \mathrm{Isom}_{\underline{\mathrm{Revuni}}(\mathbb{D}_x^*)}\left(\underbrace{G(A)}_{\| \ \mathbb{D}_{x,A}^{*\sim}}, \mathbb{D}_x^{*\sim} \right) \end{cases} ,$$

and by the universal property of $\underline{\mathrm{Gr}}(\underline{\mathcal{A}}_x)$, these functorial isomorphisms extend over the category $\underline{\mathrm{Gr}}(\underline{\mathcal{A}}_x)$. Thus the situation is one where we have a commutative group $T|\overline{T}$ $(= T_x)$, three connected T-groupoids $\mathcal{G}, \mathcal{G}', \mathcal{G}''$ 266

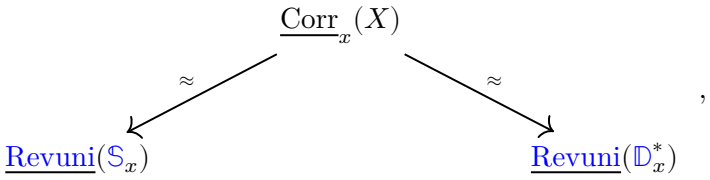
[scan 269]



[p. 782]

Definition We say that we have a correlation between a universal covering $\mathbb{S}_x^{\sim}$ of $\mathbb{S}_x$, and another $\mathbb{D}_x^{*\sim}$ of $\mathbb{D}_x^*$, when we have given ourselves an element of $H(\mathbb{S}_x^{\sim}, \mathbb{D}_x^{*\sim})$.

Thus, if $A \in \mathcal{A}_x$, the datum of a correlation amounts to the datum of an element of $H(A)$, i.e. of an isomorphism [d1] between the T_x-torsors $\mathbb{S}_x^{\sim}(A)$ and $\mathbb{D}_x^{*\sim}(\mathrm{Ep}|E_p(A))$. This identification is compatible with the inclusion relations between arcs $A \subset A'$. [d2] The correlations between $\mathbb{S}_x^{*|\sim}$ and $\mathbb{D}_x^{*\sim}$ form a torsor under|over T_x. [d3]

Let $\underline{\mathrm{Corr}}_x(\mathfrak{X}|X) = \underline{\mathrm{Corr}}_x(X)$ be the category of [d5]triples $(\tilde{\mathbb{S}}_x, \tilde{\mathbb{D}}_x^*, h)$ of correlated universal coverings of $\mathbb{S}_x$ and of $\mathbb{D}_x^*$, we have [d6] functors

$$(\tilde{\mathbb{S}}_x, \mathbb{D}_x^{*\sim}, h) \begin{cases} \longrightarrow \mathbb{S}_x^{*\sim|\sim} \\ \longrightarrow \mathbb{D}_x^{*\sim} \end{cases}$$

[scan 270]

All these constructions have been carried out intrinsically carefully enough to pass to isomorphisms of germs of differentiable surfaces $(X,x) \xrightarrow{u}_{\sim} (X',x')$. Suppose chosen, in addition to $(\mathbb{S}^{\sim}_x, \mathbb{D}^{*\sim}_x, h_x)$ relative|relative to (X,x), also $(\mathbb{S}^{\sim}_{x'}, a\,\mathbb{D}^{*\sim}_{x'}, h'_{x'})$ relative|relative to (X',x'). Now the isomorphism of the germs being given, it therefore induces

$$(118)\quad \begin{cases} u_{\mathbb{S}}: & \mathbb{S}_x \simeq \mathbb{S}_{x'} \quad \text{isomorphism of topological spaces} \\ u_{\mathbb{D}^*}: & \mathbb{D}^*_x \xrightarrow{\sim} \mathbb{D}^*_{x'} \quad \text{isomorphism of germs of spaces} \end{cases}$$

$$u_T: \quad T_x \simeq T_{x'} \qquad \text{isomorphism of the } \mathbb{Z}\text{-modules topological free of rank 1}$$

Let us then consider the two sets

$$(119)\quad \begin{cases} F(u) = \text{set of isomorphisms} \quad \mathbb{S}^{\sim}_x \simeq \mathbb{S}^{\sim}_{x'} \text{ over } u_{\mathbb{S}} \\ \\ G(u) = \text{set of isomorphisms} \quad \mathbb{D}^{*\sim}_x \simeq \mathbb{D}^{*\sim}_{x'} \text{ over } u_{\mathbb{D}^*}, \end{cases}$$

they are both T_x-torsors. This being so, I say that we have a canonical isomorphism of T_x-torsors

$$(120)\qquad F(u) \xrightarrow{\sim} G(u)$$

— i.e. "it comes to the = to lift $u_{\mathbb{S}}$ to $u_{\tilde{\mathbb{S}}}: \mathbb{S}^{\sim}_x \simeq S^{\sim}_{x'}$, or to lift $u_{\mathbb{D}^*}$ to [d2] $u_{\mathbb{D}^{*\sim}}: \mathbb{D}^{*\sim}_x \longrightarrow |-\mathbb{D}^{*\sim}_{x'}$". To see this, we note that by [d3] transport of structure[i4] the 269

[scan 271]

[p. 783]

inverse images under $u_{\mathbb{S}|\mathcal{S}}$ and under $u_{\mathbb{D}|D^*}$ of $\mathbb{S}|\mathcal{S}^{\sim}_{x'}$ and of $\mathbb{D}|D^{*\sim}_{x'}$, that is|that is $\mathbb{S}|\mathcal{S}'^{\sim}_{x}$, $\mathbb{D}|D'^{*\sim}_{x}$, are equipped with a correlation, which I denote by h'_x. This posited, [d1] canonical isomorphisms of T_x-torsors

$$(121)\quad \begin{aligned} F(u) &\simeq \mathrm{Isom}_{\mathbb{S}|\mathcal{S}_x}(\mathbb{S}|\mathcal{S}^{\sim}_{x}, \mathbb{S}|\mathcal{S}'^{\sim}_{x}) \\ G(u) &\simeq \mathrm{Isom}_{\mathbb{D}|D^*_x}(\mathbb{D}|D^{*\sim}_{x}, \mathbb{D}|D'^{*\sim}_{x}) \end{aligned}$$

Now by the diagram of equivalences (117) we do have isomorphisms of T_x-torsors

$$(122)\qquad \begin{array}{ccc} & \mathrm{Isom}((\mathbb{S}|\mathcal{S}^{\sim}_{x}, \mathbb{D}|D^{*\sim}_{x}, h_x), & \\ & (\mathbb{S}|\mathcal{S}'^{\sim}_{x}, \mathbb{D}|D'^{*\sim}_{x}, h'_x)) & \\ \swarrow^{\sim} & & \searrow^{\sim} \\ F(u) = & & G(u) = \\ \mathrm{Isom}(\mathbb{S}|\mathcal{S}^{\sim}_{x}, \mathbb{S}|\mathcal{S}'^{\sim}_{x}]|) & & \mathrm{Isom}(\mathbb{D}|D^{*\sim}_{x}, \mathbb{D}|D'^{*\sim}_{x}) \end{array} ,$$

whence the canonical bijection sought (120) — [d2] which gives in particular (96).

[d3] The canonical bijection (120) has the following ± obvious property, which characterizes it:

$$(123)\quad \begin{cases} \text{Let } u_{\mathbb{S}|\mathcal{S}^{\sim}} \text{ and } u_{\mathbb{D}|D^{*\sim}} \text{ be } {}^{[d5]}\text{liftings}^{i1} \text{ of } u \ {}^{[d6d7]}\ \mathbb{S}|\mathcal{S}^{\sim}_{x} \simeq \mathbb{S}|\mathcal{S}^{\sim}_{x'},\ \mathbb{D}|D^{*\sim}_{x} \longrightarrow \mathbb{D}|D^{*\sim}_{x'}, \\ \text{associated by (120), let } A \in \mathcal{A}_x,\ A' \in \mathcal{A}'_x \text{ its image under } u_{\mathbb{S}|\mathcal{S}}, \text{ let } \alpha \text{ be a section} \\ \text{of } \mathbb{S}|\mathcal{S}^{\sim}_{x} \text{ over } A,\ \beta \text{ the section of } \mathbb{D}|D^{*\sim}_{x} \text{ over } \mathrm{Ep}|E_p(A) \text{ associated|associated by} \\ \text{the correlation } h_x, \text{ let } \alpha' \text{ be the section of } \mathbb{S}|\mathcal{S}^{\sim}_{x'} \text{ over } A' \text{ deduced from } \alpha \text{ by} \\ \text{applying } u_{\mathbb{S}|\mathcal{S}^{\sim}},\ \beta' \text{ the section of } \mathbb{D}|D^{*\sim}_{x'} \text{ over } \mathrm{Ep}(A') \text{ deduced from } \beta \text{ by applying} \\ u_{\mathbb{D}|D^{*\sim}}, \text{ then } \alpha' \text{ and } \beta' \text{ are associated by the correlation } h'. \end{cases}$$

[scan 272]

This [d1] (for A, α fixed) characterizes the map [d2] (120), because for $u_{\mathbb{S}|\mathcal{S}^\sim}$ fixed, it determines $u_{\mathbb{D}|D^{*\sim}}$ as follows: we have β by h_x, α' deduced|deduced from α by $u_{\mathbb{S}|\mathcal{S}}$, β' deduced|deduced from α' by $h_{x'}$, now β' must be equal to the section deduced from β by applying $u_{\mathbb{D}|D^{*\sim}}$: $\mathbb{D}|D_x^{*\sim} \longrightarrow |-\mathbb{D}|D_{x'}^{*\sim}$, and this indeed determines $u_{\mathbb{D}|D^{*\sim}}$ uniquely ...

N.B. We can use this construction, for A, α fixed, to define the map (120), we find that it is a T_x-morphism (hence an isomorphism) and, [d3]at the same|=[i1] time, that it does not depend on the choice of α. But a priori it depends perhaps on the choice of A, and the point which requires verification is that this bijection in fact does not depend on the choice of A. We know indeed that for $A \subset A'$, it is the same|= for A and A'; |, whence at once the result, for the equivalence relation generated in $\mathcal{A}_x$ by the inclusion relation is the indiscrete relation 271

[p. 784]

F) Application : differential interpretation of the special Teichmüller groups.

Let X be a topological space, equipped with a subset I that is discrete finite[i1], such that X is a surface in a neighborhood of I — moreover we give ourselves a differentiable structure (C_1)[i2] in a neighborhood of the|of I. Let G [d1] be a topological group, operating continuously on (X, I), and respecting the differentiable structure of X in a neighborhood of S. Let|Let

$$(124)\quad \begin{cases} \mathbb{S}|\mathcal{S}_{X,I}\ \text{or}|\sim \mathbb{S}|\mathcal{S}_I = \coprod_{x\in I} \underbrace{\mathbb{S}|\mathcal{S}_{X,x}}_{\text{or } \mathbb{S}|\mathcal{S}_x}\ , \\ \mathbb{D}|D^*_{X,I}\ \text{or}|\sim \mathbb{D}|D^*_I = \coprod_{x\in I} \underbrace{\mathbb{D}|D^*_{X,x}}_{\text{or } \mathbb{D}|D^*_x} \end{cases}$$

we assume that the operation of G on $\mathbb{S}|\mathcal{S}_S$ induced by the action of G is also continuous.

Let, for $\forall\ x \in I$, $\mathbb{D}|D^{*\sim}_x$ be a universal covering of $\mathbb{D}|D^*_x$, and put

$$(125)\quad \mathbb{D}|D^{*\sim}_{X,I}\ \text{or}|-\ \mathbb{D}|D^{*\sim}_I = \coprod_{x\in S} \mathbb{D}|D^{*\sim}_x\ .$$

Let us for the moment forget the differentiable data, and consider the group

$$(126)\quad \widetilde{G} = \left\{ u, \tilde{u} \;\middle|\; \begin{array}{l} u \in G,\ \tilde{u} \text{ a lifting of} \\ u_{\mathbb{D}|D^*_I} \text{ to an automorphism } u_{\mathbb{D}|D^{*\sim}_I} \\ \text{of } \mathbb{D}|D^{*\sim}_I \end{array} \right\}$$

We have a homomorphism $(u, \tilde{u}) \longmapsto \tilde{u}$, $\widetilde{G} \longrightarrow G$, which is 272

an epimorphism, and, putting

$$(127)\quad T_I = \prod_{x\in I} T_x\ ,$$

we have an exact sequence

$$(128)\quad 1 \to T_I \to \widetilde{G} \to G \to 1\ .$$

I would like to introduce on $\widetilde{G}$ a topology such that (128) becomes an exact sequence of topological groups. Replacing G if necessary by the open subgroup G' of finite index kernel of the canonical homomorphism

$$(129)\quad G \longrightarrow \mathfrak{S}|\mathcal{S}_I\ ,$$

hence $\widetilde{G}$ by the inverse image $\widetilde{G}'$ of G', we are reduced to the case where G operates trivially on I, [d1] Then $\widetilde{G}$ is expressed[i1] [d2] [d3] as the fiber product over G of the family, indexed by I, of the extensions

$$(130)\quad 1 \to T_x \to \widetilde{G}_x \to G \to 1$$

corresponding to the cases $I_x \overset{\text{def}}{=} \{x\}$. Thus we are reduced to the case where card $I|S = 1$. 273

[p. 785]

Let [d1]

$$\{\Delta_{x,0} \tag{131}$$

be a|a [d3] of neighborhoods|neighborhood of x in X which is|are [d4] an[i1] open disks|open disk, [d5] We can then find a universal covering $\Delta^{*\sim}_{x,0}$ of $\Delta^{*}_{x,0} = \Delta_{x,0} \setminus \{x\}$ which induces|induces $\mathbb{D}|D^{*\sim}_{x}$ on $\mathbb{D}|D^{*}_{x}$. By the continuity hypothesis, there exists a neighborhood U of 1 in G, and a neighborhood $\Delta_{x,1}$ of x, such that we have

$$\begin{array}{ccc} U \times \Delta_{x,1} & \longrightarrow & \Delta_{x,0} \\ \cap & & \cap \\ G \times X & \longrightarrow & X \end{array} , \tag{132}$$

and we can suppose that $\Delta_{x,1}$ is an open disk|open disks. This taken; for fixed $u \in U$, giving the lifting $\tilde{u}$ of $u_{\mathbb{D}|D_x}$ to $\mathbb{D}|D^{\sim}_{x}$ is equivalent to giving a lifting to [d6]

$$\widetilde{\Delta}_{x,1} \xrightarrow{\tilde{u}_{0,1}} \Delta^{\sim}_{x,0} \tag{133}$$

compatible with

$$u \mid \Delta^{*}_{x,1} : \quad \Delta^{*}_{x,1|0} \longrightarrow \Delta^{*}_{x,0} \ .$$

That said, in the inverse image $\widetilde{U}$ in $\widetilde{G}$ of the neighborhood U of 1 in G, we are going to 274

introduce the topology the coarsest making continuous[i1] [d1] the maps

$$(134)\quad \begin{cases} p_1|p_i : \widetilde{U} \longrightarrow U & \text{induced|induced by } \widetilde{G} \longrightarrow G \\ q : \widetilde{U} \quad \Longrightarrow | \longrightarrow \quad \mathrm{Cont}(\Delta^{*\sim}_{x,1}, \Delta^{*\sim}_{x,0}) & (u,\tilde{u}) \longmapsto \tilde{u}_{0,1} \\ q' = q \circ \sigma, \quad \text{where } \sigma(u,\tilde{u}) = (u,\tilde{u})^{-1} : & \widetilde{U} \longrightarrow \mathrm{Cont}(\Delta^{*\sim}_{x,1}, \Delta^{*\sim}_{x,0}) \end{cases}$$

We shall have|I shall have taken care to take $U|\widetilde{U}$ stable under $u \mapsto u^{-1}$, which implies that the same|= holds for $\widetilde{U}$.

We thus find, with the help of this topology on $\widetilde{U}$, [d7] the filter of neighborhoods of $1_{\widetilde{G}}$ in $\widetilde{U}$, hence also its image filter in $\widetilde{G}$. We must check that the latter is indeed the filter of neighborhoods of 1 for a topological group topology, and that for this topology, $\widetilde{G} \to G$ is a covering of G. [d8]I admit[i3] that everything works.

When X is a surface[i4] compact and orientable, connected[i5], and [d9] if $T|\overline{T}$ denotes its module of

[p. 786]

orientations, then all the T_x are canonically isomorphic to $T|\overline{T}$

$$T_x \simeq T|\overline{T} \qquad \forall x \in I, \tag{135}$$

and the exact sequence (128) takes the form

$$1 \longrightarrow T^I|\overline{T}^I \longrightarrow \widetilde{G} \longrightarrow G \longrightarrow 1 \tag{136}$$

The "universal" case is the one where

$$G = \mathcal{A} = \operatorname{Aut}\operatorname{top}(X, S) \tag{137}$$

(with the topology of uniform convergence of the u and of the u^{-1}), Then in the anabelian cases (the type of (X, S) being g, ν, and

$$\begin{aligned} &2g - 2 + \nu > 0 \quad \text{i.e.} \quad 2g + \nu \geq 3 \\ &\text{i.e.} \quad (g, \nu) \neq (0,0), (0,1), (0,2), (1,0) \end{aligned} \tag{138}$$

)|, then we know that $\mathcal{A}^0$ is 1-connected (is|and even|= contractible) hence every|every [d1]extension[i1] of $\mathcal{A}^0$ by a discrete group is canonically split, and the extension $\widetilde{\mathcal{A}}$ of G then comes from an extension $\widetilde{\mathcal{T}|\tau}$

$$1 \longrightarrow \mathbb{Z}^I|T^I \longrightarrow \widetilde{\mathcal{T}|\tau} \longrightarrow \mathcal{T}|\tau \longrightarrow 1 \tag{139}$$

of the Teichmüller group

$$\mathcal{T}|\tau = \mathcal{T}|\tau(X, S) = \mathcal{A}/\mathcal{A}^0 = \pi_0(\underbrace{\operatorname{Aut}\operatorname{top}(X, S)}_{A|\mathcal{A}}) \tag{140}$$

which|that thus takes the name of special Teichmüller group of (X, S). For arbitrary G the action of G on (X, S) amounts to giving a homomorphism of topological groups

$$G \longrightarrow \mathcal{A}|A$$

fitting into a diagram of topological groups

$$\begin{array}{ccc} G & \longrightarrow & \mathcal{A}|A \\ \downarrow & & \downarrow \\ \pi_0(G) & \longrightarrow & \mathcal{T}|\tau = \pi_0(\mathcal{A}|A) \end{array} , \tag{141}$$

and we then find, by functoriality, that the $\widetilde{G}$ constructed previously is the inverse image of the extension[i1] $\widetilde{\mathcal{T}|\tau} = \mathrm{Sp}\,\mathcal{T}|\tau\ a|\alpha$ of $\mathcal{T}|\tau$ by $\mathbb{Z}^I$, via $G \longrightarrow \mathcal{T}|\tau$.

These preliminaries being taken, let us return to the situation where X admits a differentiable structure C_1 in a neighborhood of $I|S$, and let for $\forall\, x \in I|S$, 277

[p. 787]

$\widetilde{\mathbb{S}|\mathcal{S}}_x$ be "the" universal covering of $\mathbb{S}|\mathcal{S}_x$ correlated with the universal covering $\mathbb{D}|D_x^{*\sim}$ of $\mathbb{D}|D_x^*$. Put

$$\widetilde{\mathbb{S}|\mathcal{S}}_I = \coprod_{x \in I} \widetilde{\mathbb{S}|\mathcal{S}}_x, \tag{142}$$

and note that we have, for $\forall\, u \in G$, a one-to-one correspondence between the set of liftings $\tilde{u}_{\mathbb{D}|D_I^*}$ of $u_{\mathbb{D}|D_I^*}$ to automorphisms of $\mathbb{D}|D_I^{*\sim}$, and the set of liftings $\tilde{u}_{\mathbb{S}|\mathcal{S}_I}$ of $u_{\mathbb{S}|\mathcal{S}}$ to automorphisms of $\widetilde{\mathbb{S}|\mathcal{S}}_I$, which is an isomorphism of T_I-torsors. This correspondence is compatible with compositions, and we thus find a canonical isomorphism

$$\widetilde{G} \simeq \text{group of the } \left\{ u, \tilde{u}_{\mathbb{S}|\mathcal{S}} \;\middle|\; \begin{array}{l} u \in G,\ \tilde{u}_{\mathbb{S}|\mathcal{S}_I} \text{ lifting} \\ \text{of } u_{\mathbb{S}|\mathcal{S}_I} \text{ to an} \\ \text{automorphism of } \mathbb{S}|\mathcal{S}_I^{\sim} \end{array} \right\} \tag{143}$$

We check that this is a topological isomorphism by putting on the second [d1] the coarsest topology making continuous the maps

$$\begin{aligned} & p_1^a|p_1 : \widetilde{G} \longrightarrow G \\ & q_1 : \widetilde{G} \longrightarrow \mathrm{Aut\,top}(\widetilde{\mathbb{S}|\mathcal{S}}_I) \qquad (u, \tilde{u}_{\mathbb{S}|\mathcal{S}}) \longmapsto \tilde{u}_{\mathbb{S}|\mathcal{S}} \\ & q_1' = q_1 \circ \sigma : \widetilde{G} \longrightarrow \mathrm{Aut\,top}(\widetilde{\mathbb{S}|\mathcal{S}}_I) \end{aligned} \tag{144}$$
